The earliest public institutional care for dependent children in England was provided in the workhouse, an existing institution for adults founded through private initiative. Into the mixed public workhouse, sometimes called poorhouse or almshouse, there were gathered not only children and the aged and more destitute adult poor but the blind, diseased, feeble-minded, immoral and insane. Later it became the accepted practise to put into the almshouse the dependent child who was too young to work and immediately to indenture older children. Recognition of the terrible experiences of dependent almshouse children who were indentured in groups to work in factories and mines

resulted during the early part of the nineteenth century in some of the first statutes directed against the abuse of child labor. Indenture is still used to some extent in England to enable children leaving institutions at working age to attain self-support, but it is regulated by statute.

Partial substitutes for almshouse care were the orphan asylums founded by religious or other private groups in the eighteenth century, the number of which grew rapidly in the early part of the nineteenth century. Segregation of children from the adult population of the almshouse was begun after the report of the Royal Commission in 1834, although two or three thousand children, not all of whom are accompanied by their mothers, are still to be found in almshouses. The institutions used by the poor law authorities for this purpose were workhouse schools, which did not wholly segregate children from the adult poor; separate schools, which were residential and thus effected segregation of the children; and district schools, which were merely separate schools supported by several poor law unions of a district. Some of the congregate buildings of the separate schools housed over one thousand children and were later called barrack schools. When the separate and district schools were composed of several small buildings adjacent to one another they were called grouped cottages. The latter correspond to what is in the United States called the cottage type institution.

Another type of institutional care, the scattered home plan, was adopted in England by the Sheffield Poor Law Union in 1893 and is now widely used. Under this system the cottages instead of being grouped are scattered on different streets of a town and each cottage has its own matron or house mother. The children usually go to the nearest public school and share more or less in the local community life. At the present time the poor law unions of England not only maintain these public workhouse schools, separate schools, district schools and scattered homes but also pay for children whom they send to various private institutions and agencies certified by national authority. These certified institutions include special establishments for deaf, blind, crippled and feeble-minded children.

In Scotland the poor law authorities did not resort extensively to the almshouse and private institutions for the care of the dependent child, although such institutions existed. They adopted and still use the method, which originated in the

parish, of paying widows or married couples to take one or more dependent children into their homes. Probably over 90 percent of the dependent children in Scotland are "boarded out."

After qualified approval in 1868 by a public official this method of boarding out was slowly introduced into England. Several unions had previously used it without the knowledge of the national poor law authority. Boarding out, if it takes place within the territory of a particular poor law union, is called "boarding out within the union" and, when children are placed in homes of another union district, "boarding out without the union." In either case there is usually a local unpaid committee of citizens, including women, who serve as overseers. There is also inspection by national authorities, especially of children boarded without the union.

Since the war adoption has for the first time become legal in England and two societies have been actively promoting foster care by this means. Except in the case of adoption foster family care without pay has not developed to any appreciable degree. Another form of public aid supplementary to parental care is a system of pensions or insurance to the widow and dependent children of an insured person. In addition to public care England has many private institutions, agencies, emigration societies and the like, some of which board children out. The general tendency both in institutions and in organizations supervising boarding out has been to provide such care and education as will enable the individual child to earn his own way at a reasonably early age and thus to prevent a consciousness of dependency which might lead to pauperism.

Neither the institution nor the foster home monopolizes the field of dependent child care. In 1926 there were in England about 69,000 dependent children, of whom over 10,000 were boarded out, 18,000 placed in workhouses, 32,000 in poor law schools and the rest in other institutions. In 1928 this number was considerably reduced for all groups due to the operation of the widows', orphans' and old age pensions.

In the United States similar provisions have been made for dependent children: first almshouses; then special institutions, with indenture as a supplement or substitute; the gradual shifting of emphasis to foster home care; and the enactment of mothers' pensions as a way of maintaining the home.

Mixed almshouses and indenture provided most of the care for dependent children in the older states for the fifty years preceding 1875. As early as 1729 a separate institution for dependent children was established in connection with the Ursuline convent in New Orleans in order to shelter children orphaned by Indian massacres. The first publicly supported institution was founded in 1790 by the city of Charleston, South Carolina. During the nineteenth century an increasing number of orphan asylums were established mainly by religious, social, fraternal and in some few instances non-denominational groups. Indenture was frequently resorted to by poor law officials, but after 1853, especially under the leadership of the Children's Aid Society of New York, care for considerable numbers of children of working age or approximately of that age was provided without the form of indenture in free foster families. Indenture now survives in strict legal form in only a few states, although it was used by a public institution in Wisconsin until 1925.

After 1883 the movement to place children in permanent free foster homes gained further support. Following the formation of a society later known as the Illinois Children's Home and Aid Society some thirty similar societies were founded, chiefly in the Middle West and South. These organizations, privately administered and state wide, were usually called state children's home societies and later merged in the National Children's Home and Welfare Association. Through their efforts infants and young children, many of them illegitimate, were placed out and as a rule legally adopted. Children over six were not so frequently adopted through legal means. One of the difficulties encountered was the frequent separation of children of the same family. An effort was made to provide the older children with schooling and to safeguard them from overwork, and in most cases the legal form of indenture was not used by these free foster home agencies. Nevertheless, the desire for cheap child labor was too often a factor in the decision of a family to provide a home for a dependent child.

About the same time boarding home care of children was introduced. In 1868 the Massachusetts State Board of Charity began the method of boarding out at public expense, and the system of boarding out was advocated by the Boston Children's Aid Society and the Pennsylvania Children's Aid Society.

Meanwhile, especially after 1875, the un-

segregated care of dependent children in the mixed almshouse met with increasing opposition. Most states have now made the care of children above the age of three in such institutions illegal, but in 1922 over 4000 children under sixteen years of age were admitted to the almshouses in all but three states.

Nor was the housing of children in orphanages and other special institutions left uncriticized. Although hundreds of such institutions had been established in the nineteenth century, improvement in aims and methods was slow throughout the period. At the White House Conference on the Care of Dependent Children called by President Roosevelt in 1909 it was declared that "the carefully selected foster home is for the normal child the best substitute for the natural home," a finding reaffirmed by an international conference held in Washington, D. C., in 1919 under the auspices of the United States Children's Bureau. Nevertheless, it was officially reported in 1923 that the proportion of children boarded out, based on the total number of children cared for away from their own homes, was less than 1 percent in twenty-two states, while ten more states had less than 5 percent boarded. In six states no care of children in boarding homes was reported, although only two states were without some free foster home care.

The 1923 census for dependent, neglected and delinquent children (about seven eighths of whom are non-delinquent) gave a total of 404,678 children under supervision, of whom 204,888 were in institutions or receiving homes, 121,441 in their own homes, 51,164 in free foster homes and 22,281 in boarding homes. The largest group of these 400,000 children was 138,760 dependent children in institutions primarily for such children; the next largest group was 121,000 supported in their own homes by public aid to mothers.

Among agencies concerned with the placing of dependent children in free foster homes the National Children's Home and Welfare Association, a federation of state and other child placing agencies, has the widest scope. The member societies usually have receiving homes, in most of which children are given medical care and, in some, psychological examinations as well as corrective treatment. Placement and follow up work of widely varying standards are then done. The New England Home for Little Wanderers, the Lutheran Kinderfreund societies and many Jewish, Catholic, Protestant, non-demonina-

tional and fraternal children's agencies are also engaged in the work of child placement. Placement under state and county auspices is also growing. The American Legion has a remarkably differentiated national program for the care of children of ex-service men. Wherever poverty is the only cause of dependency the maintenance of the child in his own home through some form of mothers' pension is increasingly recognized as the most desirable method of care for the child.

The cost of care of dependent children in their own homes is as a rule less than the cost of their maintenance in a well equipped institution. New York finds it to be about \$28 a month in an institution and a little over \$15 for the same period at home. Of the three types of care this has had the briefest history as an organized procedure. The first state law for mothers' pensions was enacted in Missouri in 1911; the movement spread rapidly and in 1913 eighteen states adopted such laws. Mothers' pensions or some form of public aid to widows for the care of children in their own homes is now provided in all but two states. Faulty administration due to defects in mandatory provisions, insufficient appropriations and the like have made the benefits from this legislation fewer than they might be.

In France the system of public care dates from the time of Napoleon. Provision is made for public care of dependent children in boarding family homes to supplement provisions made by church congregations, founding asylums and orphanages. The expense of public care is shared by the local commune, the department and the national government. Inspection is directly under the prefect of each department subject to the general control of the state minister of the interior. A majority of war orphans, *pupilles de la nation*, have been cared for on the same general plan of family home care, although with different procedure. By special arrangement some of these war orphans have been cared for in private institutions.

In 1922 Germany established a youth council, or Jugendamt, for each local unit of government or group of such units. These youth councils are centralized in provincial offices and act as guardian to each dependent child. According to the law it is the duty of the youth council to act as a link between the state and the child and between the child and such authorities as the guardianship tribunal, children's courts, poor law authorities and the like.

In Germany more than a third of a million mothers are receiving widows' pensions.

In nearly all the European countries which took part in the World War the great increase in numbers of dependent children and the curtailment of personal, charitable and religious resources threw extra burdens upon the various taxing bodies both for direct care of dependent children and for subsidy of the great numbers of private institutions and agencies. Foster family care has been developed to supplement institutions, and to this movement the temporary relief agencies such as the Red Cross and the Near East Relief have contributed. Their work has included placement of children who were made destitute by the war and for whom there has been no room in institutions. They have sought to place older children who have been discharged from institutions in self-supporting positions in the community. In most European countries, because of the small number of training schools, competent supervision of foster family care is not yet as general as it should be.

Russia delegates the care of dependent children, whose numbers were vastly increased by the famine in the post-war period, to the commissariats of health and education. Under their direction every effort has been made to avoid mistakes committed by institutions in less centrally supervised countries. Conditions and facilities differ, however, in the ten autonomous provinces and eighteen autonomous republics. Altogether there are thousands of institutions and a few colonies and communes for dependent children, all under public auspices, supervised by the commissariats and supported mostly by provincial and smaller local governments. Recently the emphasis on institutional care has been modified by a realization of the importance of home or foster home care.

In Turkey in addition to the orphanages, of which most are in Constantinople, there is an incorporated private enterprise, the Turkish Association for the Protection of Children, with headquarters in Angora and with hundreds of local centers. This organization has a large budget from various private sources and a small government grant. It is not only doing preventive, protective and health work but developing better institutional and foster home care of dependent children.

New Zealand's thoroughgoing system of infant care has stimulated similar treatment of dependent children in foster homes. A well organized system of widows' pensions is extend-

ed to certain groups of needy mothers and there is also provision for dependent children of insured persons. In Australia institutional care is still provided, although in several states the Scottish practise of boarding out was adopted and has been carried on for many years under the direct supervision of a children's department. Recently a beginning has been made in boarding some children with their own mothers or providing widows' pensions.

No one system is able to meet the needs of all dependent children. Recent developments in psychology and psychiatry have emphasized the need of a stable home life for the child and the importance of emotional attachments in the earliest years and have shown the urgency of maintaining the home wherever possible. Yet a recent study of children in foster homes in an eastern state showed that more than three fourths of them had been taken from home conditions which were definitely bad. In such cases the foster home, free or boarding, may offer the best possible substitute for the child's own home. The boarding home is particularly useful for temporary cases, such as sickly, malnourished or problem children who are not suited to the free placement which often leads to adoption. Free homes sometimes offer the child the greatest opportunities but may be unsuitable for children whose kinship ties should not be broken and who are likely to be claimed later by relatives.

Although the foster home is considered the better form of care for most dependent children, the institution is still predominant; and especially in view of some of the recent reforms in the aims and methods of the best of them the institution has a definite place as an observation center and as a means of temporary care for children needing extensive health services. As foster family home facilities now exist, the institution has the added advantage of enabling children who are to be away from their families only temporarily to avoid forming other family attachments; or it may house, although not as a rule in a united group, a family of brothers and sisters too large to be easily placed in a private home.

In any method of care which may be given the dependent child expert case work is needed. Home conditions must be investigated, emotional assets used and efforts made to maintain the home or to reconstruct it. The child must be given whatever clinic services are necessary and in an institution he must receive individualized

opportunities for study, play and vocational guidance. Boarding and free foster homes must be investigated and suited to the individual child, who must be enabled to become self-supporting and must receive such after care as will insure the most effective use of his native capacity and of the training and treatment he has received.

HENRY W. THURSTON

NEGLECTED CHILDREN. The term "neglected children" might in a general sense include any children whose interests are not properly protected by responsible persons, organizations or governmental bodies. In technical usage, however, the term is restricted to those children who come to the attention of the social agency or court because of the wilful or deliberate neglect of one or both parents. At law and in professional social work usage "neglected" children are distinguished from "dependent" children who are under the care of a social agency, institution or court because deprived of the necessities of life by factors other than intentional neglect of parents.

The two groups are not always sharply differentiated either by statute or by the measures commonly taken for their assistance. A certain amount of neglect is frequently associated with dependency or delinquency, a fact which inevitably leads to confusion in treatment. The problems presented to the court or the case work agency in dealing with the parents of each group are, however, quite distinct. In the case of a dependent child plans for improving the child's condition are made on the theory that the parents are in a cooperative attitude, whereas with the neglected child the parents are likely to be hostile to the supervisory organization's proposals.

In sections of the United States, however, where child protective work or care of neglected children has been widely developed, as in Massachusetts, New York and New Jersey, we do find a clear cut legislative distinction between dependent and neglected children. In these states when a dependent child is removed from his home and parental control the change of custody is effected without the intervention of the juvenile court, while a neglected child under similar circumstances is invariably brought before the court on the theory that he is or may readily become delinquent and is likely to need the supervision of the juvenile court.

The first organization to undertake the pro-

tection of neglected children was the New York Society for the Prevention of Cruelty to Children, founded in 1875 by Henry Bergh and others. There were already in existence in many cities humane societies whose aims included the protection of animals, old people and prisoners. Most of these later added to their already diversified activities the protection of children, which, however, seldom became a very important factor in their programs. Flagrant instances of cruelty to children convinced the founder of the New York society that there was a need for an organization devoted exclusively to the legal protection of neglected and abused children.

Shortly after its formation similar societies and protective agencies were organized in other states and cities of the United States. The scope of their protective work has to some extent been influenced by the development of the New York society. Founded as an organization for the enforcement of law this society was concerned primarily with the rescue of any child suffering from brutal treatment or living in degrading surroundings. It began a vigorous program to this end, appearing in court for children, presenting evidence in the prosecution of the guilty and acting as custodian and guardian when so appointed. Whenever it found no sustaining statutory provisions for dealing with neglected children it became active in securing the necessary legislation. It did not concern itself with the causes which led to child neglect nor, except incidentally, with their removal. This attitude was not clearly indicated in a suit brought by the society to prevent the State Board of Charity from exercising powers of inspection and supervision. In the final decision of the New York Court of Appeals, rendered in 1900, the court upheld the view that the society was law enforcing rather than charitable and therefore not subject to the control of the State Board of Charity. In its specialized sphere of law enforcement, however, the New York society early set a standard of efficiency which became a model for other similar agencies. Moreover it imposed upon the entire movement its own increasingly narrow interpretation of function. Mangold in his *Problems of Child Welfare* (New York 1924) has attributed this concentration on legal prosecution to the close historical and functional association between the efforts to prevent cruelty to animals and those to prevent cruelty to children.

In many instances, however, organizations which followed the general policy of the New York society did not resent being classified and

supervised as charities. A few others, such as the Massachusetts society, outlined a broader program from the beginning, and it is from these that the most constructive work of child protection has come. These societies in stressing preventive and constructive work have cooperated with other child welfare or charitable agencies. The principle of retaliation against the parent, which usually took the form of legal removal of the child, has inevitably given way to attempts to reorganize and reconstruct family situations conducive to child neglect. At the present time even the New York society has broadened its scope, seeking removal of the child "only when imperative" and encouraging guardians to reconstruct their homes.

A broad program of protection for neglected children should, and in most instances does, include far more than mere protection from physical cruelty on the part of parents or employers. Child protective agencies early in their history took into consideration the need of regulating the employment of stage children, especially young vaudeville and acrobatic performers. But many forms of exhausting, degrading and crippling child labor still stand sorely in need of regulation. There is an ever widening recognition of the necessity for protection from various immoral associations in the home, in the street or in the course of the child's occupation which are likely to contribute to juvenile delinquency. Less obvious cases, such as those of undernourished, defective, crippled and other handicapped children needing suitable medical and surgical care, are coming within the scope of these societies. Recognition of problems of child neglect arising out of the lack of supervision where the mothers go out to work has brought cooperation with the appropriate public or private agencies. Illegitimate children are a group particularly likely to be neglected, and special if not altogether adequate legislation, such as regulation of baby farms, has been enacted through the efforts of protective agencies. Jewish social agencies have in forming a National Desertion Bureau made a unique effort to cope with cases of neglect arising out of desertion by the family wage earner. In the case of children of immigrant parents, who are not familiar with the chances for delinquency offered by a complex social environment and are accustomed to standards of child welfare differing widely from those of the American community, obviously something more is needed than purely punitive measures of correction.

A comparative analysis of the types of cases handled at various stages of the movement for child protection indicates this broadening tendency. The first twenty-five cases of abuse reported by the New York society were characterized as follows: beating or other physical cruelty, 13; children begging and accompanying an organ grinder, 2; children sent out by parent or guardian to beg, 2; attempted assault, 2; abandonment of child, need of medical care, child found intoxicated, child living in immoral resort, father not supporting child and commitment to an institution without court action, 1 each. There was nothing subtle about the cruelty or neglect involved in most of these cases, which were concerned largely with physical neglect of the child. Although prevention of physical brutalities is still necessary the number of such cases has greatly diminished. On the other hand with the development of a more positive conception of child welfare our idea of what constitutes neglect has been considerably extended. Demoralizing or degrading conditions whose injurious effect on the child is less immediate and obvious are now the main concern of any well run children's protective society. Cases involving protection of children from immoral associations, from lack of medical or surgical care, from early sex irregularities, from the vicissitudes of life with one parent or the other when marital relations are broken, are typical of the bulk of the work done today. An analysis of the work of the Massachusetts society about ten years ago showed that only 6 percent of their cases dealt with cruelty. The widespread general decrease in the number of cases of physical brutality reported is thought to be due in part to fear of punishment, in part to less intemperance and in part also to generally higher family living standards.

At present in many communities private agencies organized for other purposes, such as children's aid societies, family welfare agencies and legal aid associations, assume the responsibility for child protection. In certain instances children's protective societies have been combined with other children's organizations in the interest of more effective coordination of effort. The work of policewomen in many large cities has been of great preventive value and many of the activities of truant officers, probation officers and juvenile courts are concerned with child protection. Through these various public agencies child protective work, which is essentially a public service, is coming to be in a larger

measure assumed by the state or local governments and financed by public funds.

There are no reliable statistics showing the extent of children's protective work in America or in other parts of the world. However, according to the report of the United States Bureau of the Census, *Children under Institutional Care, 1923* (Washington 1927), 140 children's protective societies in the United States reported that they had aided 21,754 children during the three months ending April 30, 1923. Of these 20,138 or 92.6 percent were in the New England, east north central, west north central and Pacific states, and 10,246 or 47.1 percent were in the middle Atlantic states alone. These figures show that societies specifically for the protection of children are very unevenly distributed through the United States.

Toward the end of the nineteenth century the force of the movement for child protection extended beyond the United States. The National Society for the Prevention of Cruelty to Children was incorporated in London in 1884 and now has over a thousand branches in the British Isles. There are similar societies also in Paris and Berlin.

In all Canadian provinces except Quebec there is social guardianship for children under the Children's Protective Act, and any child in danger of neglect may be made a ward of the government and referred by it to the Children's Aid Society, to the Superintendent of Neglected Children or to the Director of Child Welfare. In Australia voluntary child welfare organizations or state subsidized institutions undertake child protective work. The Australian states have extensive protective laws for children forbidding their taking part in dangerous employment, soliciting alms and the like. Under what was formerly called the Neglected Children's Aid of Victoria children are committed to the care of the Children's Welfare Department or to the care of individual persons or approved institutions. New South Wales makes provision for neglected children under the children's court acts, Tasmania through a Department for Neglected Children under the Children's Charter and western Australia under a child welfare act.

The Child Welfare Office of Germany is charged with the protection of all foster children under fourteen years and may withdraw them from their foster homes if their physical, intellectual and moral welfare demands it. In Austria if there is likelihood of neglect the courts

may intervene; and there are penalties for mistreatment of children or failure to provide maintenance.

Russia has an institute of children's inspectors to investigate cases of exploitation or ill treatment of children and young persons and to give protection to those who are homeless. There are receiving stations for homeless children and observation centers staffed by teachers, doctors and psychologists to investigate the characteristics of each child and determine the institution to which he should be sent.

The Italian National Maternity and Child Welfare Organization since 1925 has been charged with the protection and assistance of minors under eighteen in need of maternal care or moral help. In Portugal minors declared to be in moral danger also are put under the guardianship of the *tutorias*, or children's courts, as well as all destitute, exposed and abandoned children and those whose families are regarded as unfit to provide for their moral training or education. The court may order the families to pay maintenance and place the children in institutions or adoptive families. Hungary admits to orphanages or places with relatives or foster parents all abandoned children and those exposed to danger of moral destruction on account of neglect or the damaging influence of their surroundings.

Sweden gives the Communal Committee for Protection of Children (Barnavårdsnämnd) charge of children who are ill treated by their parents, whose health or education is neglected or who are in danger of being corrupted by their parents' immorality. The committee can admonish the parents, place the children in institutions or find for them suitable occupations.

In the international field the Advisory Committee for the Protection and Welfare of Children and Young People of the League of Nations is making extensive and practical studies of measures of protection in the various countries, such as legislation in behalf of illegitimate children and an analysis of the effect of the development of the motion picture industry upon children not only as spectators but as actors. The League's Committee on Traffic in Women and Children is active in seeking international cooperation to avoid moral hazards possible under unregulated international migration. Its Child Welfare Committee is also planning studies of the causes of dependency and delinquency among children. In general its emphasis is on the endeavor, through a com-

parison of existing laws and through the discussion of desirable standards, to raise the standards of backward nations.

C. C. CARSTENS

DELINQUENT CHILDREN. Only in recent years has our social machinery dealt with the delinquent child on the principle that he is primarily a child and secondarily a violator of the law. In the case of the dependent and neglected child there has been little question as to the guiding principle of social treatment. The tardiness of progress in this respect has been commensurate only with our slowness in learning to understand the essential nature of the child and in granting him a favored position in the community. In the matter of criminal jurisdiction, however, through long centuries of history violation of the law has loomed much larger than immaturity of the offender. The changes in social concepts which have led to the present treatment of the delinquent child have had an almost dual history: one phase in the law, another in the treatment of the child himself—a little slower, more reluctant in the former; experimental, somewhat more daring in the latter. In fact the legal changes have been due almost wholly to the conviction that has gradually grown up in practical treatment that there is no essential difference between a child found guilty of violating a law—technically delinquent—and the child called "dependent" or "neglected."

The typical modern state makes separate provision for the delinquent child as distinguished from the adult offender in at least three phases of the judicial process: in the definition of crimes and designation of corresponding punishments as contained in the penal codes; in the nature of the punishment provided or, more particularly, in the nature of imprisonment; and in the criminal procedure and jurisdiction for trying the delinquency of the child.

Although in the past severe punishments and even death were at times prescribed for the child who showed disrespect for or revolted against the authority of parent or elder, the codes which have become the basis of western procedure have tended to differentiate in favor of the child. The underlying tendency in western criminal legislation has been to create parallel scales between criminal responsibility, that is, the intellectual capacity for judging the nature of one's act, and the punishment to be imposed for the crime committed. In these scales of

responsibility the child has naturally been found at the lower levels and punishment correspondingly has been of mitigated severity.

The Roman law, which has had particularly great influence upon ideas of penal minority, made the following distinctions: it regarded the child under seven years of age as lacking all responsibility, as incapable of committing a crime (*doli incapax*) and consequently as not subject to legal punishment. From the age of seven to fourteen years for a boy and twelve years for a girl (the state of prepuberty), a child was considered as only partially responsible. The praetor decided in each case the question of the child's understanding of the nature and consequences of his act, presumably. If he possessed the necessary degree of intelligence he was subject to the same punishment as an adult. For certain crimes, however, a lesser punishment was sometimes specifically provided. Thus under the Twelve Tables certain thefts by a child were punished with less severity than when committed by adults. Indeed the problem of theft by children may be said to have been prominent in all early legislations. It was generally for this crime that exceptional leniency was allowed in the cases of minors. Finally the code recognized one other period preceding adulthood, i.e. from the ages of fourteen and twelve years for boys and girls respectively, to the age of twenty-five years. Where the imposition of punishments of relative severity was permitted the praetor, he might take the offender's age into consideration. The Romanized canon law first allowed as a general principle the discretionary rule of punishment that a minor above seven years of age, when proved responsible, might be punished, but always more mildly than an adult.

The Germanic laws, which prevailed until the reception of the Roman law, rested upon an altogether different basis. The law was not so much interested in the subjective condition of the wrongdoer as in the objective necessity of securing compensation for injury. The age of twelve was generally accepted in the old Germanic laws as the limit of tolerance. Thus under the Salic law when a child under twelve committed a crime the guardian was required to pay the composition, though not the peace money. The *Sachsenspiegel* was to the same effect. But under the *Schwabenspiegel*, which marks the growing severity of the German penal law, two age limits, seven and fourteen years, were set. Even when a child under seven committed a

crime the composition could be demanded, but only if the guardian was capable of paying it. Although capital punishment of children under the age of fourteen was not legally permissible it did gradually become established. In 1505, by special permission of the emperor, two children were executed for killing their mistress: a girl of thirteen was burned alive and a boy of twelve beheaded. The age limits of seven and fourteen show the influence of the Roman law, whose moderating effects were, however, not felt to any considerable degree except perhaps in the south German states. The *Carolina*, the penal code of Charles V, necessitated by the confusion caused by the reception of the Roman law, involved a still further retrogression. No definite age of exemption from punishment was fixed at all. Nevertheless, thieves under the age of fourteen were declared to be subject to milder punishments than adults, and the dominance of the Roman law established exceptions of practise whereby, even for other crimes than theft, children under seven were not punished at all and those under fourteen were more mildly dealt with than adults.

The common law of England held to the Roman model only in establishing the age of seven years as the lower limit of criminal responsibility. As Blackstone says: "But by the law, as it now stands, and has stood at least ever since the time of Edward III, the capacity of doing ill, or contracting guilt, is not so much measured by years and days as by the strength of the delinquent's understanding and judgment. For one lad of eleven years old may have as much cunning as another of fourteen; and in these cases our maxim is that '*malitia supplet aetatem*.' Under seven years of age, indeed, an infant cannot be guilty of felony, for then a felonious discretion is almost an impossibility in nature; but at eight years old he may be guilty of felony. Also, under fourteen, though an infant shall be *prima facie* adjudged to be *doli incapax*, yet if it appear to the court and jury that he was *doli capax*, and could discern between good and evil, he may be convicted and suffer death. Thus a girl of thirteen has been burned for killing her mistress; and one boy of ten, and another of nine years old, who had killed their companions, have been sentenced to death, and he of ten years actually hanged; because it appeared, upon their trials, that the one hid himself, and the other hid the body he had killed, which hiding manifested a consciousness of guilt, and a discretion

to discern between good and evil. And there was an instance in the last century where a boy of eight years old was tried at Abingdon for firing two barns; and, it appearing that he had malice, revenge, and cunning, he was found guilty, condemned and hanged accordingly. Thus, also, in very modern times, a boy of ten years old was convicted on his own confession of murdering his bedfellow, there appearing in his whole behavior plain tokens of a mischievous discretion; and, as the sparing this boy merely on account of his tender years might be of dangerous consequence to the public by propagating a notion that children might commit such atrocious crimes with impunity, it was unanimously agreed by all the judges that he was a proper subject of capital punishment" (*Commentaries*, bk. iv, ch. ii, sec. 23-24).

It is apparent that, if the Roman law affected the insular common law, it must have influenced the majority of European criminal codes in modern times to an even greater extent. A famous French draft of a code, prepared by Muyart de Vouglans in 1780 (*Les lois criminelles*), reproduces the Roman law with no apparent change. But the code which actually resulted from the French Revolution marked a distinct departure from Roman ideas. Many of the central European codes adopted in the first half of the nineteenth century, such as the codes of 1813 and 1861 in Bavaria, the code of 1839 in Württemberg, the code of 1840 in Hanover, the code of 1841 in Hesse, the code of 1845 in Baden, show not only the influence of the Roman but that of the new French law.

The *Code Napoléon* represented a marked reform despite its apparent retrogression from the Roman model in not definitely fixing an absolute penal minority of seven years. But it did, nevertheless, accomplish much in raising the age of presumed limited responsibility to sixteen years. Under the *Code pénal* the judge was left to decide in each case whether the offender under sixteen might be presumed to have been responsible, that is, to have acted with *discernement*. If he had not, he was to be acquitted; but according to circumstances he was to be either returned to his parents or sent to a house of correction, where he was to be educated and detained for a period of time determined by the judge, such time not to extend, however, beyond the completion of his twentieth year of age. But unfortunately the "houses of correction" did not exist, and it seems that the ordinary depart-

mental prison was called such for the purpose of confining minors. A detailed scale of punishments adjusted to the degree of *discernement* manifested by the accused was provided. Thus, for example, if the crime were punishable by death, life imprisonment or transportation in the case of an adult, the punishment for a minor was to be ten to twenty years imprisonment in a house of correction. If an adult would have incurred a penalty of penal servitude or solitary confinement, the punishment for a minor was to be imprisonment in a house of correction for a period of not less than one third or more than one half the time for which an adult would have been sentenced, and so on.

The French law finally raised the age of penal majority to eighteen, and this age has found wide acceptance in other codes. But the faint beginnings of correctional treatment of children, provided however ineffectively under the *Code Napoléon*, were really far more important than the legal definition of penal age limits. The establishment of separate institutions for the imprisonment of young "criminals" was gradually brought about by reformers. Before the first ones were established by law or recognized in the penal codes, their prototypes were founded by private philanthropy and conducted under private control. The first reformatory institution for children to be recognized as a public institution, although technically retaining its private form of organization, was the House of Refuge, an American experiment established by an act of 1824 in New York state. In 1826 the New York legislature made it mandatory upon the managers of the institution to receive children properly committed by the appropriate judiciary. In England the short lived Parkhurst Juvenile Prison was created in 1837, and the first special departments of the French *maisons centrales* were set aside for children in 1842, some eight years before the passage of the French law providing for reformatory education of delinquent children in *colonies pénitentiaires*. But all these institutions and those that followed them are more truly incidents in the history of the care of orphaned, homeless and neglected children than in that of the treatment of criminals, and were championed from time to time by pioneers in that field, such as Herman Francke (1663-1727), Canon Odesalchi (1679-1741), Johannes Falk (1768-1826), Count Van der Recke (1764-1846) and Johann Wichern (1808-81).

From the point of view of the legal status of the delinquent child there are at least two im-

portant features of the public institutions for the commitment of children convicted of crime: first, their separation from adults and their concentration in special institutions, which represented the transitional phase from the concept of the young criminal to that of the child in trouble; and second, the tendency to derive from the special status of the institution a corresponding legal differentiation of the delinquent child from the adult criminal—that is, to define the child's status in terms of the function of the institution rather than in terms of laws violated by him. Striking examples are afforded by the House of Refuge and the Elmira Reformatory, two of the pioneer institutions of their kind in America. The board of managers of the House of Refuge was given powers which apparently bear little relation to criminal punishment. "The managers," said the law, "shall have power to place the said children committed to their care, during the minority of such children, at such employments and cause them to be instructed in such branches of useful knowledge as shall be suitable to their years and capacities. . . ." The law creating the New York State Reformatory for Men in Elmira is an even more striking instance of the effect that the establishment of a physical institution may have upon the changing of legal concepts. According to this law (which also introduced the indeterminate sentence for adults) male offenders from the ages of sixteen to thirty years, an age group which had never before been recognized as having any distinct legal status, either civil or criminal, might be committed to the new institution for any offense except murder. The term of those committed to the reformatory was made entirely independent of their special offense and subject only to the judgment and discretion of the board of managers.

The creation of the juvenile court marked the next significant step in the treatment of the delinquent child. The juvenile court may be defined fundamentally as a court dealing exclusively with children of certain ages who have been accused of crime. These courts brought about a revolution in the treatment of the delinquent child. They have done away with the trial of children in the demoralizing atmosphere of the ordinary criminal courts. Of far greater importance, however, is the special procedure itself, which has in effect virtually destroyed the substantive law of crimes with regard to delinquent children. The jurisdictional age limits of the juvenile courts thus become in effect the

true limits of criminal responsibility, and as they range from sixteen to twenty-one, the extent to which they represent a more enlightened conception of juvenile criminality than that which obtained previously can well be appreciated. Moreover, as the juvenile court idea has spread from the United States where it was first realized to England and the continent, the reform it represents may be said to be widespread.

The legal status of the delinquent child, however, except where all laws relating to children have been codified in a recognized children's code or its equivalent, is still a composite of somewhat overlapping legal provisions, namely, the definitions of criminal responsibility contained in the penal code or the common law, the provisions relating to the creation and administration of penal and reformatory institutions and the law and procedure governing the juvenile courts. For instance, ameliorating conditions as far as juvenile offenders are concerned have often been the result of reforms in the general penal law applying to adults and children alike, as the creation of probation in Massachusetts as early as 1869 and of parole at least as early as 1876 in the United States and earlier in England in the form of "ticket of leave." Then there have been changes in the law intended directly for the benefit of minors, such as the legal separation of minors from adults in jails and prisons; the prohibition of the detention of children under sixteen in any prison, as, for example, in the New York state law of 1877; and quasi-administrative regulations of the judiciary system itself, such as the Juvenile Offenders Act in England in 1847 and the Summary Jurisdiction Act of 1879, which gave judges jurisdiction to try children and young persons, except in cases of homicide. However, a unity for the somewhat uncoordinated legal provisions is provided by the administrative procedure which has gradually developed in the treatment of delinquent children as socially neglected or uncared for. There is every probability that any differences in the legal positions of delinquent, neglected and dependent children will soon disappear. The factors tending toward this result are notably the progress in educational psychology, the expansion of the mental hygiene movement, the discoveries in psychiatry, the growth of social case work and case studies in juvenile delinquency. Legal concepts are becoming of far less importance than the idea of the social treatment of unadjusted children.

PHILIP KLEIN

INSTITUTIONS FOR THE CARE OF CHILDREN.

As a means of caring for dependent, neglected, handicapped and delinquent children outside of their own homes the institution is still overwhelmingly predominant in practically all countries. The most generalized type of institution is that commonly called the orphanage, or, when it is designed for younger children, the foundling asylum. This, however, represented an advance over the public workhouse, almshouse or poorhouse, in which children were housed not only with dependent or aged adults but with the insane as well as with human derelicts of all sorts. Despite its name, the orphan asylum often admits other types of dependent children, and it has been said that not one tenth of the inmates of such institutions are orphans. At the outset there was a tendency to admit not only the more or less normal cases of dependent and neglected children but also children suffering from physical or mental disabilities. The understanding of the special needs of handicapped groups has led to the creation of special institutions for the care or training of the blind, the deaf, the crippled and the mental defectives; and reform schools, junior republics, detention homes and the like have been established for the segregation of delinquents or other well defined groups. The so-called children's institution now generally includes only the more or less normal dependent child.

The large majority of these institutions were founded by private religious, social or fraternal organizations and are still maintained by them. At the present time in the United States only one tenth of the total are under public auspices. The tendency of state and county authorities has been to replace the state orphanage by foster home care and by mothers' assistance laws which make it possible to maintain children in their own homes. Only in Russia are all children's institutions under public auspices, publicly financed and with complete public supervision. Elsewhere the semiprivate or private institutions are usually supported by private philanthropies, although in some cases they may receive public aid from city, state or county.

During the nineteenth century both in England and in the United States children's institutions sprang up in rapidly increasing numbers and were a favored form of philanthropy. In the United States their number increased from 6 in 1800 to 1500 in 1923, 400 of them having been established between 1890 and 1903. The numerical increase was not accompanied by a

corresponding development in technique or in the appreciation of the problems involved, and for almost one hundred years there was little improvement in methods or management.

At the beginning of the twentieth century, however, these institutions became increasingly subject to criticism. This was reflected in the decision of the White House Conference on the Care of Dependent Children in 1909, which went on record as preferring foster home care wherever possible. In recent years there has been a growing tendency to question the relative value of institutions even for handicapped and delinquent groups. The realization that other means of caring for children, even where more desirable, could not entirely and immediately supplant the institution, as well as a recognition of its definite place in a program of child care, has led to a number of studies aimed at the improvement and "de-institutionalization" of institutions. These studies and activities have been conducted by the United States Children's Bureau and more especially by the Child Welfare League of America. Various sectarian bodies both local and national have also turned their attention to the problem. For instance, in the larger cities wherever there is an organized Jewish community the Bureau of Jewish Social Research has stimulated the organization of a central bureau of child welfare. The National Conference of Catholic Charities has held annual conferences for those in charge of Catholic children's institutions and has also stimulated the organization of central diocesan agencies to supply case work service for the institutions. The tendency of the Protestant churches toward individualism has resulted, on the whole, in a lack of cooperation, although the Federation of Agencies Caring for Protestants in New York City has been effective in dispelling the isolation of individual Protestant agencies in its vicinity. The various studies, surveys and conferences have resulted within the last decade in a vast improvement in technique and in administration of the institution, as well as in a correlation of its activities with those of other child welfare agencies.

One of the most discussed aspects of the institution is that of housing and its effects. The congregate institution, housing large numbers of children, compelled to wear uniforms and subject to other forms of regimentation, has been particularly criticized. As a substitute the "cottage type" has been recommended, in which small groups of children are housed in

separate cottages, each with its own house mother and in which the atmosphere of a home is duplicated as far as possible. An even more radical departure is the English type of "scattered home," in which the cottages, instead of adjoining each other, are located on separate streets of the same town. Because of the higher cost of the cottage type of institution and the greater difficulties of supervision and because of the existence of buildings which could not immediately be scrapped, a compromise plan has been worked out, particularly in some of the Catholic institutions, by which children are separated into groups, each under the supervision of a nun. Nevertheless, the congregate institution still predominates. Within the congregate institution itself regimentation is overcome by such methods as abolition of the uniform, spending money allowance, the encouragement of schemes of self-government and the introduction of techniques for individualizing the treatment of each child. Considerable attention has also been given to the facilities of the institution as regards space, ventilation and the like in an effort to improve the bad housing of the older institutions. Standards have been evolved for such institutions by the United States Children's Bureau. Although the appalling mortality rates for the old asylums have been considerably reduced they are still higher than those for non-institutional children. This may be due to conditions at admission, for which the institution cannot be held wholly responsible. In the case of infants the mortality rate is lower for institutions than for other forms of child care.

Discussions concerning the location of institutions have resulted in a consensus of opinion against the city, provided, however, that the rural location be fairly accessible to other communities, to the families of the children and to schools. Particularly in the case of Catholic institutions there has been a definite reduction in the number of urban institutions.

Considerable difference exists both in opinion and practise in the matter of schooling. On the whole it is agreed that wherever possible it is better for children in institutions to attend public schools in order that they may participate in community life and mingle with non-institutional children. Outside schooling is common among Protestant institutions, the rule in Jewish institutions and the exception in Catholic homes. There has been considerable disagreement with regard to the relative value of the

non-vocational education in the public schools and the manual training commonly given in the institution, as well as to the eventual usefulness of the vocational training thus received.

Undoubtedly one of the greatest difficulties in the conduct of institutions for the care of children is that of personnel. In the past the position of matron of an institution has too often been filled by misfits in other occupations, partly because of the arduousness of the work and the low salaries paid. In recent years there has been more emphasis not only on better personal qualifications but on special training and higher salaries for general workers. These general workers are often supplemented by experts in the various branches of medicine, psychiatry, diet and recreation, as well as by social workers who correlate individual case studies. Along with this improvement in staff has come a better understanding of the functions and methods of institutional care. This will affect institutional work in its entire procedure from admissions to discharge and after care.

The problems of admission, discharge and after care illustrate particularly the necessity not only for expert care within the institution but for the correlation of its work with that of other agencies for the care of children. Originally the orphan asylum and founding home not only accepted all applicants but in some instances even sought them. At the present time applicants may be rejected on the ground of mental or physical incapacity, if such is the policy of the institution, after careful examination, recording of social history and the evaluation of other possible means of care. The rejected applicant is, however, usually referred to specialized institutions or to welfare agencies. Likewise in discharging a child such elements are considered as the extent of family reconstruction or other forms of post-institutional care, the mental and physical capacities of the child, his capacity for self-support and his reference to proper placement agencies. The effects of follow up work after discharge and of better care during the period spent within the institution have led to less frequent reiteration of the charge that the ranks of criminals and other social misfits receive an undue proportion of their recruits from children's institutions.

The Child Welfare League has been influential in inducing many institutions to reject such practises as the use of surrender and indenture forms. Studies have been made of the influence of the length of stay, in conjunction with other

qualitative factors, on the capacity of the discharged child to care for himself or to adjust himself to a non-institutionalized environment. One of the criticisms of the institution has been that it has created so artificial an atmosphere either through regimentation or through too well arranged environment as to make post-institution adjustment difficult if not impossible for many children. The desire of children to return to institutions is no longer uncritically accepted as a mark of its efficacy.

Many of the defects in institutional care, in cases where the staff itself may have been cognizant of methods of correction, have been attributed to the personnel of the boards of trustees and the lack of public supervision. In the early days there was no general supervision by any public authority, and there are still many private institutions today without any such inspection. An increasing number of states now have legislation requiring all organizations to obtain permission from the state authorities before the establishment of an institution.

Reference has been made to our "orphaned" asylums to indicate the oversupply of institutions in the United States, many of them operating below the minimum modern standards of child care. In 1923 it was estimated that there were 1500 institutions housing 150,000 dependent children, with a staff membership of 14,000 and annual budgets aggregating from sixty to seventy million dollars. The orphanage is still a favored form of charity, particularly because of the sentimental appeal of the orphaned child and partly no doubt because of the concrete evidence which such an institution offers as to the philanthropy of its donor. Many institutions for dependent children have large endowments which perpetuate them whether they are needed or not. The situation is aggravated when property has been left as a memorial to a church or to a board of managers but no funds provided to carry on the work. The larger congregate institutions have, however, often been closed and cottage type institutions, home treatment or a combination of both substituted for them.

In any consideration of the values of the various types of care it will be seen that there is still a definite place for the institution, particularly in view of the vast improvements made in recent years. According to Dr. R. R. Reeder, one of the most constructive critics of the institution, the following groups benefit more from institutional than from other forms of care:

children of family groups too large to be placed in one foster home or in separate foster homes so situated as to keep the children in close family touch with one another; children deprived of both parents in need of such special training or opportunities as foster family homes cannot provide; children whose surviving parent or other close relative stands in such affectionate relationship with them as to make it inadvisable for the children to form new foster family attachments; children for temporary special treatment before placing in family homes; children who have become repeated misfits in foster family homes; children of widowers who may later reestablish their family homes; and those of low mentality needing early industrial training. Some of these standards have been subjected to further inquiry. Whatever general principles may be considered as properly governing the scope of the institution, it is evident that only through careful case work and co-operation with all agencies can the best decision be made. With the further extension of modern placing out systems, of mothers' pensions arrangements and of more selective methods of admission the number of institutions will undoubtedly decrease to meet the actual needs of those cases which are properly institutional charges.

MARTHA P. FALCONER

CHILD LABOR. The term "child labor," a convenient expression for "the labor of children," has a well recognized though rather vague meaning. It refers both to an economic practise and to the attendant social evil. The economic practise had been taken for granted until, in England, at the onset of the industrial revolution the social evil was discovered. Since then reformist usage of the phrase has brought about a general acceptance of a peculiarly moral or humanitarian connotation.

Child labor as an economic practise signifies employment in the so-called gainful occupations or a material contribution to the labor income of the family, as in the period before the wages and factory systems or today in agriculture on the home farm. Its extent is readily measured by quantitative standards, such as those used in the United States Census of Occupations; and nothing but an age line differentiates it from adult labor. But the extent of child labor as a social evil is determinable only by methods of qualitative analysis, with consideration of the character of the actual jobs in which children

are engaged, the dangers to which they are subjected in their work and the desirable opportunities of which they are deprived by reason of their being "gainfully occupied."

Knowledge of the prevalence and increase or decrease of child labor in this latter sense depends as yet too much on opinion and too little on measurement. Occupational statistics cannot represent a survey of child labor from the standpoint of human values, and no adequate set of tests and measures has been constructed.

The initial emphasis in reformist effort was naturally placed on obvious wrongs to be immediately righted, and there grew up a stereotyped conception of child labor as pertaining to very young children engaged primarily and almost exclusively in industrial forms of employment, particularly in factories and mines, and exposed to physical and moral dangers. While none of these forms and aspects of child labor has disappeared in this or any other country, they constitute a narrow and anachronistic but strongly persistent notion of child labor as a social evil. In certain countries and localities, particularly those only recently affected by industrialization, reformist activity still has to do with more obvious and revolting conditions.

Interpretation, however, has broadened, so that child labor in other than industrial pursuits receives more attention; the protection and education of children over fourteen is one of the major issues of today. More and more it is realized that many of the problems center about the difficulties of adolescence, for an understanding and adjustment of which the point of view of the mental hygienist is necessary. Any adequate conception of child labor begins with the child himself, his nature and his needs both present and future. Every child laborer is a child with all the needs of other children. He needs opportunity for growth not only physical but in mind and personality, through all the activities and experiences which properly belong to childhood. And when the business of wage earning, or of participation in self or family support, conflicts directly or indirectly with the business of growth and education, the result is child labor.

In such a conception play has an important part but does not exclude the role of work—not deadening, but enlivening and self-developing work, involving purpose, plan and freedom. In other words the function of work in childhood is primarily developmental and not economic. A broad program of reform, accordingly,

concerns itself with the conservation and cultivation of the definite values to be found in work activities and of the work impulses, interests and capacities of children both before they leave school and after they enter employment. It is not confined to merely negative aspects such as the prevention and prohibition of premature, excessive and unsuitable work in gainful occupations. It stresses adequate preparation for occupational life, provides intelligent guidance and aids in proper adjustment. Children's work, then, as a social good is the direct antithesis of child labor as a social evil.

The history of child labor is bound up with the status of the child, his rights and privileges in general. As the group developed its cultural aids to the point where its economic dependence on the labor of children decreased, the appreciation of childhood for its own sake rather than for purely utilitarian reasons began slowly to increase. The process was, no doubt, reciprocal. The prolongation of the social infancy of the child, along with the growth and complexity of the social heritage, has been marked by a lightening of the child's share of the burdens of self and family support, by a postponement of his assumption of adult economic responsibilities and by the establishment of institutions and agencies for utilizing this extended leisure.

Agricultural and industrial workers of servile status formed the bulk of the population everywhere in ancient and mediaeval times, and their children were early put to arduous drudgery in house and field. The apprentice in a mediaeval craft guild was comparatively fortunate, assured as he was not only of maintenance and training but of permanent employment in his chosen trade. In the textiles, however, even before the coming of the factories, children were largely without benefit of apprenticeship in the guild tradition. Most unfortunate of all were the workhouse or pauper children of England, so numerous during the seventeenth and eighteenth centuries that the parish overseers bound them out regardless of training and welfare to any sorry masters in any sort of business.

The cotton factories established in the country districts of Lancashire and Yorkshire toward the close of the eighteenth century were worked largely by pauper children from London and other towns, whence they were brought in cartloads. The atrocities visited upon these boys and girls, housed in horribly overcrowded and unsanitary dormitories and literally driven to

death in the mills, form one of the darkest chapters in the history of childhood. But the pauper apprentices were not the only children exploited. In 1800 or a little later, in England, the majority of boys and girls employed in the mills and factories belonged to working class families which had been reduced to dire straits by their inability to make a living any longer from home manufacturing or small farming or the common combination of both.

It was not until 1794 that public attention was aroused to conditions of child labor in factories. In that year a committee headed by Dr. Thomas Percival of Manchester investigated an infectious fever which had broken out in the cotton mills of Lancaster and reported that, while the disorder was not caused by "the injury done to young persons through confinement and too-long-continued labor," it was aggravated by it. The report suggested, moreover, "this further very important consideration, that the rising generation should not be debarred from all opportunities of instruction at the only season of life in which they can properly be improved." Thereafter a few ineffective attempts were made by local authorities to curb the spreading evils of the situation. In 1802 was enacted the first protective legislation with the passage of the Health and Morals Act to Regulate the Labor of Bound Children in Cotton Factories, sponsored by Sir Robert Peel. This act forbade the binding out of children younger than nine years, restricted the hours to twelve actual working hours a day and prohibited night work. The act of 1819 still applying only to cotton mills extended protection to other than bound children.

Following the Napoleonic wars the factory system, beginning with cotton and woolen mills, took root on the continent. The period of most marked abuses came before the forties and the first measures of legislative protection for workers in Prussia, France and other European countries applied, as in England, to children in textile establishments. The more widespread effects of industrialization on child labor were felt in the seventies in Germany and Belgium and a decade later in Italy. In these countries legislation dealt with child labor in industrial and later in commercial establishments, but overlooked until very recently the child worker in agriculture. In the other countries which remained predominantly agricultural child labor in agriculture and in industrial homework was and still is a major problem.

In the United States the factory system and the new industrial order date from 1790 when Samuel Slater built a cotton mill in Rhode Island. Factories were later established in New England and the middle Atlantic states, but unlike those in England they did not find any large class of poverty stricken workers who had no choice but to seek employment for themselves or their children in the mills. Nevertheless, conditions were favorable to the extensive employment of boys and girls, partly by reason of the colonial tradition of hard work and plenty of it as good for their souls and partly because of nationalistic ambitions for the development of industry with the cheapest labor available.

Slater's first employees were boys and girls ranging in age from seven to twelve; thereafter he adopted the practise, not uncommon in England, of employing whole families under a single wage agreement. David Humphreys, in Connecticut, secured a number of children from almshouses in New York. In Lowell and other Massachusetts towns the majority of the workers were daughters of neighboring farmers. It was reported in 1832 by the New England Association of Farmers, Mechanics and Other Working Men that two fifths of all persons employed in New England factories were between seven and sixteen years of age. Hours of labor were long, never less than ten, seldom less than twelve, often fourteen or fifteen or even more. The first child labor law in the United States, in Massachusetts, was not passed until 1836. It provided that no child under fifteen should be employed in any manufacturing establishment unless he had attended a school for at least three months in the preceding year. In 1842, in Massachusetts, the labor of children under twelve in textile factories was limited to ten hours a day. In the same year Connecticut forbade the employment of children under fourteen for more than ten hours a day in cotton or woolen mills. The Pennsylvania law of 1848 forbade employment in textile mills of children under twelve. These early laws were inadequately enforced.

Well nigh universal labor of children, at early ages and for long hours, characterized even the pre-factory era. Drilled and sweated workers, including children, were employed in the manufacture of millinery, cardboard boxes, metal ware, furniture and the like long before the introduction of the water wheel into industry. The very tendencies which gave rise to child labor in the machine age, such as the

splitting up of occupations into specialized routine jobs, robbed the work of the child laborer of any educational or vocational value. Under the drive of the increasingly important motive of profit the factory and machine methods of production intensified the routine character of work and added to the hazards of all workers and especially of children. Heavy as may be the indictment rightly laid against machines and factories, it is nevertheless important to note that changes directed toward engaging fewer children and at shorter hours have been greater and certainly more rapid in the machine era than in all previous history.

It is worthy of note that with the exception of the first period of the machine age the number of children per family has decreased with its spread. Children have tended to become economic liabilities rather than economic assets. Not only has the proportion of all children to all adults declined but also the proportion of working children among all workers. This latter tendency is less marked in agriculture than in other pursuits. On the other hand, the increase of legislative protection is especially marked with respect to industrial occupations. The countries and states most advanced industrially have in general the highest effective standards of legislative protection and of educational opportunity.

In the machine age child labor has become enormously diversified. Industrial pursuits have multiplied, commerce, transportation and communication have expanded and the effects of the business regime on the organization of agriculture have not been altogether beneficial to the workers on the land. There is in addition a new complex of economic activities and occupations growing out of new standards of consumption. The majority of working children reported by the United States census in 1920 were employed in non-industrial occupations; in non-agricultural occupations the majority are found outside the mining, manufacturing and mechanical pursuits.

Agriculture in the machine age has undergone revolutionary changes. The use of machinery and the application of science have enabled the farmer to cultivate a larger acreage or to cultivate more intensively; but at the same time they have often increased the amount of work to be done by hand. The larger the farm the more work there is for children to do, especially where there is a shortage of hireable labor; if the farm is small, in consequence perhaps of unsuccessful

management, the family is even more likely to depend on itself. Although work on the farm has many undoubted advantages for these children it often occupies too large and exclusive a place in their lives; and although the economic plight of the American farmer today calls for remedial action, no group is in greater need of "farm relief" than the farm boys and girls.

What is generally called "the industrialization of agriculture" refers chiefly to the organization of large scale enterprises in the production of special crops, like onions, sugar beets, tobacco, fruits or garden truck. These, conducted on a capitalistic basis, often by companies incorporated for the purpose, and utilizing a system of wage or contract labor make extensive use of children. Their work is performed under the eye of bosses or overseers, as in factories; and the same concomitants of mass production prevail, through the motive of profits, desire for cheap labor and, frequently, absentee ownership or control. It is out of door work, but hours are usually long and unregulated, serious health hazards exist and there is interference with school attendance. The practise of contracting the family labor is common and a premium is placed on the size of the family. Families with children are brought by the carload into the beet areas from distant places; families move out from nearby cities for the season regardless of the schooling thus shortened by weeks or months every year; migratory families, "following the crops" hither and yon, appear on the scene. Often they are housed in huts and barracks that would put to shame a city slum.

Until modern times income had always taken the form of a family income because women and children were accustomed to contribute to the family support by their hunting, fishing or agricultural work and by spinning and weaving cloth. Only with the adoption of factory methods of production and a money exchange for goods and services has there been a tendency to shift the major burden to the shoulders of one person, the husband and father. Nevertheless, this tendency has been obstructed by forces inherent in the new industrialism, among which may be included the new feminism, the causes as well as the consequences of which are economic in part. In England, in the nineteenth century, as the wages of the nominal bread winner were again and again reduced, only by the earnings of the whole family could a bare subsistence be obtained. The prevalingly low rate of wages paid in southern textile mills in this country

today is closely connected with the fact that the labor supply has been hitherto largely obtained by bringing whole families in from the hill farms and paying wages on the basis of the family labor.

Child labor under these or other circumstances at once supplements and depresses the family income. It may seem, perhaps, that adult wages can be but slightly affected in the United States when only 2.5 percent of all workers are in the ten to fifteen-year age group, but the situation is to be viewed with reference to particular trades and industries and particular localities. Although the proportion of ten to fifteen-year old children among cotton mill operatives dropped from 18 percent in 1900 to about 6 percent in 1920, even the ratio of one in eighteen might have an appreciable effect. In Pennsylvania, in 1920, over 11 percent of the silk mill operatives were children under sixteen; in the United States, 8 percent. It may be observed that the textile industries are exceptionally difficult for the labor unions to organize. The tendency of employers is to pay the lowest wages that the workers will accept under conditions which permit children to supplement the family income; thus child labor is not only a subsidy to industry but a direct inducement to the payment of the low adult wages and to the entrance of children into the labor market.

In times of depression and unemployment children who would otherwise be kept in school are often compelled to leave and go to work and are sometimes able to secure jobs when their parents cannot. In a period in which the employment and dependency problems of workers over forty assume their present magnitude and in which, temporarily at least, a vast amount of "technological unemployment" exists, a program for the exclusion from gainful occupations of children under sixteen would, even at the cost of the adjustments involved, result no doubt in a saving to society.

Child labor exists contemporaneously in various pursuits in countries of widely differing stages of industrial development. In China and Japan the recent rapid transition from a handicraft society to machine methods and modern techniques of production has brought about in the cotton and woolen mills and silk filatures abuses rivaling those in the darkest period of England's industrial history. These exist side by side with pre-industrial low standard child labor in agricultural and household occupations. In China under the guise of adoption or appren-

ticeship the ancient slave trade in children continues, and every year tens of thousands of these children become household drudges, rice field hands and factory toilers. It has been estimated that there are over a million child workers in modern industrial establishments alone in China. In Japan legal protection as well as industrialism is farther advanced; according to one figure there were, in 1925, 263,000 child workers, including 223,000 girls, in manufacturing establishments. About three fourths of them were in the textile industry. The total number of children employed in all occupations was in 1924 almost a million and a half. Parents often contract the labor of their children, girls more frequently than boys, to factory owners or managers for a term of years. A large majority of the employees in Japanese weaving sheds and textile mills are women and children, recruited chiefly from the farming districts. Whole families work together in the mines. The extreme poverty prevalent in large parts of the country renders difficult the enforcement of regulations pertaining to the industrial employment of children. Even in countries industrially more backward than China and Japan, as, for example, Persia and Algeria, the exploitation of very young children is common in rug and carpet making as well as in other occupations.

In most European countries considerable progress has been made in checking evils as obvious as those which still exist in the newly industrialized countries. In Great Britain the early factory acts were gradually improved upon so as to include children in ironworks, mines, sweatshops and mercantile establishments. The introduction of compulsory school attendance, the establishment of juvenile labor exchanges and other moves of general social import reinforced restrictive legislation. Both in England and in Germany the lessening of the evils of child labor came through social legislation, fostered by public bodies, by reform groups and by labor unions, as well as through apprenticeship regulations and restrictions in collective trade agreements. In Great Britain in 1929 a bill was sponsored by the second Labour government for raising the school leaving age from fourteen to fifteen with a provision for government aid in needy cases. In 1925 the total number of workers between the ages of fourteen and seventeen was over two million.

More backward countries have recently raised their standards, partly as a result of their participation in the conferences of the International

Labour Office formed in 1919 and attached to the League of Nations. All the leading nations of the world, with the conspicuous exceptions of Soviet Russia and the United States, are members of this organization. Annual conferences have been held, at which draft conventions, a number of them relating to children, have been adopted; these have been submitted to the member nations for ratification and incorporation into the law of the ratifying nations. The draft convention providing for a fourteen-year age minimum in industrial occupations has been ratified by eighteen countries; that prohibiting night work of children under eighteen in industrial pursuits, except in certain continuous industries, by twenty-one countries, and of children under sixteen in continuous industries by twenty countries; that prohibiting employment of children under fourteen in agriculture, except outside the hours fixed for school attendance, by twelve countries.

Nearly all of the fifty-five members of the International Labour Office have laws regulating the employment of children in industry, with regard to age of admission, hours and times of employment, conditions to safeguard health and education. In most of them regulation is extended to commercial work, as in stores and offices, although the age minimum and hour standards are sometimes lower. Street trades and public amusements are less often subject to regulation, and the same is true of agriculture and household work, especially when performed under parental supervision. The age of admission is usually lower for street trades than for industrial or commercial employment, but sometimes it is higher. Control of non-industrial employment is effected to a considerable extent through school attendance laws, some of which contain provisions limiting hours of outside work. Argentina has an age minimum of at least fourteen for virtually all forms of gainful employment, not including agriculture, while Poland forbids, without exceptions, the work of children for wages under the age of fifteen.

The prevailing age minimum of admission to industry, which in all cases coincides with the lower age limit for regulation, is fourteen. Exemptions are numerous; Japan and France, to cite two examples, permit children of twelve and thirteen respectively to enter industry if they have completed the prescribed elementary course. There are also poverty exemptions in many countries, but these are rapidly tending to disappear. Requirements for admission to indus-

try include a compulsory physical examination in twenty-four countries (discretionary in several others) and some educational qualification in seventeen. Examinations while at work are discretionary in twelve countries and compulsory in Sweden.

Generally speaking, the defects of legislation, aside from its weak enforcement, have been in the omission of industrial home workers and of children in agricultural pursuits. Germany, for instance, neither in its law of 1903 nor in the improvements thereon in 1918 has included the vast and ever increasing number of agricultural child laborers working under completely unregulated conditions.

The legislation of most of the states in the United States has been characterized in an informal report of the International Labour Office as being on the whole much in advance of any found elsewhere. The early legislation of the pre-Civil War days was administratively weak and inadequately enforced. The rising tide of immigration and the dynamic changes in industry tended to retard progress in the organization of adult labor into trade unions and progress in child labor legislation. In some states there was even a lowering of existing standards.

Despite successive enactments and better enforcement in the latter half of the nineteenth century, the gains did not keep pace with the phenomenal expansion of industry, its penetration into new fields of enterprise, its spread beyond state borders and its unceasing demand for the cheap labor of boys and girls. In 1900 "less than a dozen states were seriously attempting to limit the labor of children in mills, mines, factories or stores, in sweatshops or street trades. Such laws as existed were chiefly unenforced, and all were lamentably meagre. . . . In most states it was not illegal to send children as young as 10 or 8 or 7 years into a mill, and keep them at work unlimited hours. Boys of these ages were kept through the night-shift serving blowers in glass-bottle works, and as water boys all night in iron and steel mills. Day or night, in cotton mills, children's hours were commonly those of adult workers" (*The National Consumers' League; First Quarter Century, 1890-1924*, New York 1925, p. 2).

Various organizations undertook to remedy these conditions. The National Consumers' League formed in 1899 was outstanding in its efforts. In 1904 there was created the National Child Labor Committee, an organization which has devoted itself to enlightening the public

about conditions and helping to obtain more and better laws, better enforced. It has cooperated with other agencies interested in the problem. Although in the main the trade unions have depended on minimum wage standards and apprenticeship requirements to act as minimum age barriers, in such industries as mining they have carried on active and successful campaigns for child labor laws or for licensing laws prohibiting child labor under the age of sixteen. The American Federation of Labor has taken an active part in the various attempts for the enactment of federal child labor legislation. Finally, the Children's Bureau of the United States has carried on extensive studies of the types and effects of child labor.

At the present time all but two states have adopted a nominal age minimum of at least fourteen for full time employment in industry, and usually in some if not all other occupations. In many states only specifically enumerated occupations are covered. Most of the laws do not apply to agricultural work or domestic service. Montana has a sixteen-year minimum for factories, Ohio for all occupations. Six states have a general fifteen-year age limit, but one exempts children of fourteen and another exempts children of twelve on grounds of poverty. Thirty-nine states have a fourteen-year limit but the laws of eight of these contain exemptions permitting employment at earlier ages. Two states have no general age minimum and have exemptions in their compulsory school attendance laws allowing children to leave school and go to work before they have reached fourteen. The laws regulating work of school children outside of school hours are far less strict and in many states either non-existent or unenforced.

For extrahazardous occupations most states have an age minimum of sixteen or eighteen or both, but the list of such occupations varies greatly from state to state. In twenty-two states a state board of health or of labor has authority to determine occupations dangerous to children and young persons under specified ages and its rulings have the effect of laws. Eight states grant extra compensation to minors injured while illegally employed. Only twenty-one states have laws regulating the employment of children in street trades in any way, and only fourteen require badges to be worn by newsboys. Thirty-five states permit boys under twelve and twenty-nine states permit girls under twelve to engage in street trades. There is some regulation by municipal ordinances.

Hours for working children under sixteen are limited to eight a day and forty-four a week in four states; not all occupations, however, are included. Twenty-five states have the eight-hour day and forty-eight hour week for most occupations; in twelve other states this is the standard, but with serious exceptions. Eight states permit children to work nine to eleven hours a day and fifty-one to sixty hours a week. In thirty-seven states night work is prohibited for children under sixteen after seven p.m. (or earlier), although in some states there are serious exceptions.

A physician's examination and certificate of fitness are required for the issuance of work permits to children under sixteen in twenty-seven states. Periodical reexamination is required in only one state, although in a number of others an examination is required each time the child changes from one employer to another. The educational requirements for work permits vary widely from state to state. In only fifteen states and the District of Columbia is an eighth grade minimum in force. In seven states the compulsory attendance law applies only to children under fourteen years; and in most others there are exemptions to permit children to leave school and go to work at fourteen or in some states even earlier, under special circumstances.

The reluctance of certain states to adopt protective standards as high as those in comparatively advanced states, and the effect of this condition of affairs in retarding legislative progress in both "backward" and "advanced" states through the competitive advantage supposed to be enjoyed by industry in states with low standard laws, led several decades ago to a demand for federal legislation in order to secure a minimum level of uniformity. The case was strengthened by considerations of national pride and welfare and by the desire to place the United States in a position to participate in international agreements on the subject of child labor.

The first federal act, passed in 1916, prohibited the shipment in interstate and foreign commerce of goods produced in mines or quarries in which children under sixteen years of age were employed; or in mills, canneries, workshops, factories or manufacturing establishments in which children under fourteen years of age were employed, or in which children between fourteen and sixteen years of age worked more than eight hours a day or six days a week or between seven p.m. and six a.m.

This act was declared unconstitutional by the United States Supreme Court in 1918. The second federal child labor act, included in the Revenue Act of 1919, imposed a tax upon the profits of all mines and manufacturing establishments employing children in violation of the above standards. This act was declared unconstitutional by the Supreme Court in 1922.

The sixty-eighth Congress in 1924 adopted a joint resolution proposing to the several states a constitutional amendment under which the national legislature should have power, concurrent with that of the states, "to limit, regulate and prohibit the labor of persons under 18 years of age." More than three fourths of the states (the proportion necessary for ratification) acted adversely on this proposal. Only five (Arizona, Arkansas, California, Montana and Wisconsin) have certified their approval to the secretary of state at Washington.

The following tables based upon figures of the United States census, taken decennially, show the extent of child labor in the United States.

TABLE II

CHILDREN 10 TO 15 IN ALL OCCUPATIONS AND IN NON-AGRICULTURAL OCCUPATIONS IN THE UNITED STATES

YEAR	NUMBER OF CHILDREN		PERCENTAGE OF ALL CHILDREN 10 TO 15		PERCENTAGE OF ALL WORKERS	
	ALL OCCUPATIONS	NON-AGRICULTURAL OCCUPATIONS	ALL OCCUPATIONS	NON-AGRICULTURAL OCCUPATIONS	ALL OCCUPATIONS	NON-AGRICULTURAL OCCUPATIONS
1870	739,164	238,779	13.2	4.3	5.9	3.7
1880	1,118,356	396,504	16.8	6.0	6.4	3.7
1890	1,503,771	591,568	18.1	7.1	6.4	4.2
1900	1,750,178	686,213	18.2	7.1	6.0	3.7
1910	1,990,225	557,797	18.4	5.2	5.2	2.2
1920	1,060,858	413,549	8.5	3.3	2.5	1.3

The rise in the number and proportion of children employed from 1870 to 1900 is in large part an expression of expanding industry and commerce, as may be judged from the comparative stability of the ratio of children to total workers. The decline for non-agricultural occupations from 1900 to 1920 reflects the influence of child labor and school attendance legislation. It is especially marked for the age group below fourteen; the number of children ten to thirteen years old in non-agricultural occupations declined from 185,660 in 1900 to 95,841 in 1910 and to 49,105 in 1920. The huge

drop from 1910 to 1920 in the number of children employed in agriculture may be explained in part by a change in census practise. The change in the census date from April to January resulted in the omission of hosts of children beginning in the spring to take part during a large portion of the year in the planting, cultivation and harvesting of crops; and the new instructions to enumerators, with reference to farm children, strongly stressed regularity of work and disregard of chores and household tasks. Further, in interpreting the 1920 figures it must be borne in mind that the census of that year was taken at the beginning of a period of industrial and business depression, as was the fact also in 1930. A federal child labor act, later declared unconstitutional, was in operation; its restrictions on employment in mills and factories were of a higher standard than many of the states chiefly affected by it have yet attained, particularly in the matter of hours, the eight-hour provision discouraging the use of children where the longer working day was customary, as in southern textiles.

CHILDREN 10 TO 15 BY OCCUPATIONAL
CLASSES IN THE UNITED STATES

OCCUPATIONAL CLASS	NUMBER EMPLOYED		CHANGE FROM 1910 TO 1920
	1910	1920	
Agriculture	1,432,428	647,309	-54.8
Mining, quarrying	18,090	7,191	-60.2
Manufacturing, mechanical	260,932	185,337	-32.8
Transportation	20,800	18,912	-9.1
Trade	70,700	63,368	-10.4
Public service	537	1,130	+110.4
Professional service	3,566	3,465	-2.8
Domestic and personal	112,171	54,006	-51.9
Clerical	71,001	80,140	+12.9

As is apparent from Table III the decrease between 1910 and 1920 in the number of children employed affected each major group of occupations. The increase of 110.4 percent in public service is insignificant on account of the small numbers involved. The increase of 12.9 percent in clerical occupations suggests the rapid advance of commercial activities and the comparative attraction of white collar occupations. The decrease in number of children in domestic and

personal service may be explained in part by lessened demand for household servants or by decreased willingness to seek or accept jobs of this sort. The influence of legislation, of little account in domestic service and agriculture, was very significant in the mining and manufacturing fields. In these fields the decline in the employment of children was more pronounced for the ages of ten to thirteen than for those of fourteen and fifteen, the decline for the former group being as high as 72.6 percent in mining and 71.1 percent in manufacturing industries.

A selected list of non-agricultural pursuits is suggestive in a general way of the nature and environment of some of the principal occupational activities of children:

TABLE IV
CHILDREN 10 TO 15 IN SELECTED NON-AGRICULTURAL
OCCUPATIONS (UNITED STATES, 1920)

	NUMBER	PER- CENT
All non-agricultural pursuits	413,549	100.0
Messenger, bundle and office boys and girls *	48,028	11.6
Servants and waiters	41,586	10.6
Salesmen and sales-women (stores) †	30,370	7.3
Clerks (except clerks in stores)	22,521	5.4
Cotton mill operatives	21,875	5.3
Newsboys	20,706	5.0
Iron and steel industry operatives	12,904	3.1
Clothing industry operatives	11,757	
Lumber and furniture industry operatives	10,585	2.6
Silk mill operatives	10,023	2.4
Shoe factory operatives	7,545	1.8
Woolen and worsted mill operatives	7,077	1.7
Coal mine operatives	5,850	1.4
All other occupations	162,722	39.3

* Except telegraph messengers

† Includes clerks in stores

Nevertheless, the census figures for children in gainful employment cannot be accepted as a complete and accurate picture of the number of children at work during all or a large portion of the year. No account is taken of boys and girls under ten, and in some communities there are almost as many workers under that age as between ten and sixteen. In various types of seasonal agricultural work investigations have disclosed that among the children under sixteen a quarter to a third are younger than ten; boys and girls from six to ten are also numerous in street trade and tenement homework. The number of street traders, as, for example, in the case of newsboys, from ten to fifteen is many times larger than the census reports indicate.

The census does not disclose the large number of children who work for their parents in small stores and other businesses before and after school. The census reports, moreover, embody the results of no qualitative analysis (from the standpoint of health hazards or educational values) of the jobs and occupations in which children engage.

In the United States under the direction of the various agencies many analytical studies have been made to throw light on the causes of child labor as well as on its costs. It is of course known in a general way that poverty and tradition conspire to bring about the widespread employment of children. As the general economic level of the people rises, large classes are left below the poverty line or little above it. Changes in standards of living, such as a greater demand for goods beyond a mere family subsistence, make this poverty line elastic and at times indefinite. By reason of poverty or near poverty, of economic necessity or desire for the comforts and luxuries of life, the children of the family are drawn or forced at an early age into some sort of remunerative labor. Poverty and child labor beget each other and tend to perpetuate themselves in families and communities.

In spite of the accessibility of schools and the enforcement of compulsory attendance there is a great exodus from the schools into employment as soon as the law allows. Thus in the United States in 1920, while 92.5 percent of the thirteen-year old children are enrolled in school, at sixteen only 50.8 percent have remained. Numerous studies have been made, principally in urban areas, to determine why children leave school so early; in some cases reasons listed in the reports are frequently those given by children rather than those which might be disclosed by thorough investigation. A Massachusetts report explains school withdrawals before sixteen as due in 25 percent of the cases to "economic necessity" and in 40 percent to "a real and vital dislike of school." A Chicago report ascribed 60 percent of early withdrawals to "conditions in school" and 40 percent to "conditions at home." A Cincinnati study by Mrs. H. T. Woolley (*An Experimental Study of Children at Work and in School between the Ages of Fourteen and Eighteen Years*, New York 1926) lists in order of importance the following influences: level of the child's ability, parental attitude, health and industrial or economic status of the family. L. Thomas Hopkins in *The*

Intelligence of Continuation School Children in Massachusetts (Harvard Studies in Education, vol. v, Cambridge, Mass. 1924) stresses "inability to do the work of the regular school." Many other investigators emphasize unwillingness, rather than inability, to do the school work, or lack of interest in the work of the regular school.

It appears from many local surveys that scholastic retardation is more common and pronounced among children leaving school for work at fourteen than among those who stay. In several studies this difference between the groups is shown to be very marked; but according to a recent investigation in Newark and Paterson, New Jersey, the percentage of working children under sixteen who when they left school had been advanced beyond the average, in respect of the grade attained, was as large for boys and almost as large for girls as among all school children, and in Paterson was larger for both boys and girls.

These children come in hosts from poor families and poor schools; most of them have never reached the eighth grade and have no vocational training, no real knowledge of occupational conditions. The jobs which are available to them are for the most part juvenile and futuristic, and little or no use can be made of them by the continuation schools for education and guidance. A recent report of the superintendent of the Boston public schools states that the number of openings for children under sixteen years of age is becoming increasingly smaller and the character of such openings progressively less desirable, and concludes that the best work of the continuation school is in training pupils to qualify for better positions at the age of sixteen. Evans, in his more general study of educational opportunities, goes further in his statement that the time spent in continuation schools by the age group of fourteen to sixteen is practically wasted because of limited employment opportunities, and that the best work of the continuation school of the future will be with the sixteen to eighteen-year group.

The results of a study made by the White-Williams Foundation (*The Working Children of Philadelphia: a Survey of the Work and Working Conditions of 3,300 Continuation School Children*, by A. B. Griscom, Bulletin no. iii, Philadelphia 1924) showed that of the jobs held nearly half were "monotonous repetitive-action" jobs; more than half held but fair or poor opportunity for advancement; and many held no such oppor-

tunity whatever. Fewer than three fifths afforded a greater or less degree of "varied physical activity," and only 30 percent could be classed as offering "mentally stimulating work"; one third offered neither specific nor general training. A sixth grade education was regarded by employers as sufficient preparation for the jobs held by 68 percent of the children. Mrs. Woolley's study in Cincinnati showed that the type of factory work open to young beginners can be performed satisfactorily by the poorest 10 percent of the working group or the poorest 5 percent of the school group, so far as intelligence level is concerned. As to the general run of work opportunities for boys and girls between fourteen and eighteen, neither the degree of intelligence nor the school grade attained had any positive effect on the chances of getting a job or on the amount of wages earned.

It is not surprising, therefore, that working children discover, after the initial interest wears off, that the job is leading nowhere and tend to shift about frequently from one job to another. The demoralizing influence of child labor turnover is a matter of serious concern. Although it has been claimed that the continuation school has reduced this turnover, there is no conclusive evidence that job shifting among young workers has been materially checked for any large group. Any value for children in trying out one job after another is more than offset by the limited character of the available openings. Probably the schools could best provide this opportunity with informational and experimental courses in occupations. Moreover, child labor turnover brings with it idleness between jobs. In New Orleans, recently, it was found that 20 percent of the children under sixteen who had gone to work before that age were neither in school nor at work; in Chicago working children under sixteen were idle half the time.

In addition to the educational and vocational disadvantages suffered by children who leave school or even by those who do certain types of part time work must be counted the cost of industrial accidents, to which children are far more liable than their elders. Thousands of industrial accidents to children and young persons are reported annually in the United States, many of them resulting in permanent loss, or loss of use, of a member, in serious and permanent disfigurement or in death. Children too are more susceptible to industrial poisons and diseases than adult workers.

It can scarcely be denied that occupations

involving long hours of work, late hours or night employment, continuous standing, sitting or use of a single set of muscles, emphasis on the finer neuromuscular coordinations with attendant nervous strain, indoor confinement in noisy factories and dusty trades, carrying heavy loads under the arm or lifting heavy weights, pressure of speed in the performance of simple mechanical acts, contact with industrial poisons, exposure to inclement weather, crawling and bending all day along rows of onion or beet plants, are unsuitable occupations and provide harmful conditions for growing boys and girls peculiarly susceptible to certain deformations and diseases. Nevertheless, these and other equally undesirable aspects of child labor are still characteristic.

The existing data furnish little basis for comparison of the health of working children with that of children in schools. There have been few studies yielding really scientific knowledge of the specific effects of different occupations on health and growth, but physicians who have examined working children have frequently attributed their physical and medical conditions—especially any postural deformities—to the nature of their work. Tests applied to school and working children in Cincinnati led to the conclusion that "school life favors general physical vigor and energy more than working life."

Other studies disclose not causation, but aggravation of defects and ailments. A study of the health of continuation school children in New York City (New York State, Department of Labor, *The Health of the Working Child*, Special Bulletin no. 134, Albany 1924) shows that of the 412 boys and girls examined only eighteen were without some serious deficiency or impairment, while three fourths of the total number had two or more deviations from normal development and health. No less than 49 percent were doing work which directly aggravated these defects and abnormalities, such as bad posture, flat feet, cardiac weakness and defects, throat or lung affections and nervous difficulties. In sum, the data regarding the health of working children show that defects and ailments are common, that in many cases they are caused by the work performed or its environment, that in probably the larger proportion of cases the abnormal conditions are aggravated and that neglect of these conditions is likely to bring disastrous results.

A social cost not often emphasized in discussions of child labor is summarized by Miriam Van Waters, referee of the Los Angeles Juvenile

Court, in her book *Youth in Conflict* (New York 1925, p. 116): "Cruel as is the physical waste of youth in textile industries, mills, foundries, factories, canneries, fruit, cotton and beet fields and the like, the writer is of opinion that boys and girls suffer less permanent damage to character in industries which are productive, that is to say, where they can deal with processes of production, than in 'service' industries such as 'soda jerks,' messenger, telephone operator, theatre ushering, beauty shop attendants, dance-hall instructors, waitresses, salesladies, chambermaids, bell-boys, and 'entertainers.' In these latter pursuits it is mainly youth, beauty, charm and vivacity which sell their service. . . . The shafts of 'kidding,' flattery and other attentions fall more disastrously than do industrial accidents, or the slow wear and tear of mill and factory."

On the whole, conditions and needs from the point of view of mental hygiene have not received the required attention. Boys and girls in school who manifest emotional disturbances or behavior disorders are occasionally guided into employment by the recommendation of a child guidance clinic; but the great mass of children already at work are not receiving the psychiatric service which is being offered to school children in a growing number of communities.

The transition from school to industry for children under sixteen aggravates the usual emotional stress and instability of the period, which are induced by environmental forces as well as by physical and organic changes. Leaving school and going to work is a major step in a child's life; it involves breaking away from childhood dependencies and is accompanied by diverse external and internal compulsions, such as worry over home affairs, over "making good" and "getting on in the world." The new occupation may involve difficulties of adjustment in a new and complex set of relationships. The child may have left school to escape its rigidities and restraints, only to find himself subjected to the rigidities and restraints of his job, for eight or ten hours a day instead of five or six; with a boss instead of a teacher, and a machine instead of a lesson requiring his unremitting attention. He may have left school to find self-expression through interesting work, only to find that his job and the succession of other jobs to which he may turn after a short interval are stale, monotonous and without opportunity.

Fatigue, especially cumulative fatigue which

lowers the psychophysical tone and heightens suggestibility, is an important factor in the development of neurotic tendencies among working children. Employment, moreover, considerably decreases opportunity for vigorous, outdoor play, recognized as far more prophylactic in mental hygiene than the indoor, commercial amusements usually sought by the working child. The mistakes of choice and inadequacies of preparation that result from premature going to work may later eventuate in those neurotic or psychoneurotic disorders frequently found among the unemployed and the marginally, aimlessly or unhappily employed.

The importance of employment as a direct cause of juvenile delinquency has doubtless declined with the passage of legislation excluding children from occupations carrying a high degree of moral hazard. Studies of children in correctional institutions and juvenile courts reveal, however, that delinquency is much more common among working than among non-working children and much more common among children in street occupations (newsboys, errand and messenger boys and the like) than among other workers. Only in part can this difference be attributed to a difference in home conditions.

Although numerous instances of a direct connection between job and the delinquent act have been reported, the relationship between occupation and delinquency is more often a matter of general effects on personality and behavior. Much delinquency begins with truancy and much truancy with maladjustment in school. Failure in school develops the sense of inferiority which often leads the child to compensate by self-assertive behavior of an antisocial kind. But the same thing is true of employment conditions. Repression of the normal impulses, desires and powers of children at work causes them to "burst out" excessively in their hours of freedom, seeking to have a good time or to exalt their submerged and humiliated selves. Delinquency as a phase of adolescence instability is at once a revolt from monotony and restraint and an exaggerated propulsion in the direction of amusement, adventure and recognition.

Thus child labor is not to be understood by itself alone, nor is the child labor problem to be solved separately and apart from other problems of child and social welfare. It is not one, but many problems, from child health to farm relief. It involves school and education, vo-

cational guidance, employment supervision and legal restrictions. It is coming to be a problem not only of strict enforcement of rigid laws but of establishing in law and administration, if possible, a flexibility so safeguarded as not to sacrifice to the circumstances of individual cases the protection of the mass of children.

The interrelations of child welfare problems may be illustrated by the employment of so many children in the mills and factories of England and America in the early part of the nineteenth century; their presence was due not alone to their customary employment in productive labor, whether in agriculture or in domestic industries, but to the lack of any recognized activities or established facilities of other sorts. The prevalence of poverty, especially in England, was certainly influential; but even the less poverty stricken parents saw little else to do with their children than to put them to work where their labor was wanted, either at home or abroad. The alternative was play or idleness, and play was regarded as a form of idleness. There were no such things as playgrounds or play supervision. For the masses of children schooling facilities and privileges were non-existent or extremely limited. The child labor movement has stimulated and been assisted by the movement for more and better schools and for higher standards of compulsory school attendance and by the play and playground movement. Vocational guidance has the incidental but important effect of reducing the exodus from school into industry at fourteen or fifteen. Scholarship allowances, provided under private auspices and administered by the local school system, keep in school many boys and girls whose poverty would send them prematurely into wage employment. As an educational problem child labor is not a matter merely of interference with or curtailment of school attendance but of the educational worthlessness of most juvenile occupations; it is a matter also of uneducational schooling, one of the chief causes of early going to work.

Child labor is both a cause and an effect of illiteracy and ignorance, of low wages and unemployment, of standards of living and levels of family and community life. It is affected likewise by organization of workers and maintenance of labor union standards and by the organization of consumers to boycott goods produced under substandard labor conditions. The reformist program includes all measures for the relief of dependency and the reduction

of poverty, the improvement of the schools and the development of better parental and civic attitudes. Legislatively, it is concerned not alone with child labor and school attendance laws but also with minimum wages, workmen's compensation, old age insurance, grants of aid to dependent mothers and the like. Child labor reform itself is ineluctably committed to broad policies of educational and economic reform, dealing with the varied problems of adult as well as of child welfare.

RAYMOND G. FULLER

CHILD WELFARE LEGISLATION. The movement to enact legislation with regard to the rights and special needs of children was not started until the beginning of the nineteenth century, and the gains within the last thirty years have been more striking than those during the previous hundred years. This legislation has established definite status and rights for children where no such provision had heretofore been made; enacted special protective measures, first for children who were socially or physically handicapped and then in certain respects for all children; created public institutions for the care and education of children and for research into their problems; and has supervised and controlled the voluntary efforts along these lines which serve as substitutes for, or supplements to, state care. Recently there has been a movement to supplement local, state and national legislation by international agreements.

At the beginning of the nineteenth century the rights of children in statutory law in respect to health, recreation, education, protection from abuse, neglect, exploitation and exposure to physical or moral hazards or to excessive labor, or as offenders against the law were the same as for other members of the community under the common law. Even obviously helpless groups, such as foundlings, orphans and deserted children, received only sporadic or indifferent attention from the state; and certain groups, such as children of illegitimate birth, enjoyed even less protection than that accorded to the community as a whole. The province of state legislation in practise and in an individualistic equalitarian theory was conceived to be the protection of property rights rather than the protection of weaker individuals or groups in society.

Although the first protective legislation for children was enacted in England and although the United States has originated some

particulars of legislation, state action and responsibility in this field have been more readily acceptable to the countries of continental Europe. Reliance on the role of individual initiative and fear of paternalism, both so strong in English public tradition, found substantial support during the pioneer period of the United States in the actual existence of such economic opportunities as free land. Even when the social costs of child neglect became obvious in striking instances of widespread abuse, in both England and the United States a greater faith was placed in private philanthropy than in public effort. Particularly in the United States the existence of large private funds, especially for orphanages and children's societies, relieved the state and federal governments of large expenditures. Only recently has there been a tendency to follow the English custom of enacting into law provisions governing the use of charitable funds and resources. The development has been from legislation which established the status of the individual child as regards custody to legislation regulating the activities of private agencies undertaking preventive and remedial work in the care of the child and finally to legislation establishing public provision for groups of dependent, delinquent, defective and otherwise socially and physically handicapped children.

The establishment of definite legal rights for the child first took the negative form of the curtailment of the rights of others to govern the child. The English law of 1822 recognized the rights of neglected and abused children to protection from their own parents, and improvements in the poor laws curtailed the right of poor law guardians to apprentice pauper children. Then came a denial of the theoretical "right" or ability of the child to govern himself or to be held to strict accountability in the making of contracts, in hiring himself out to work, in marriage, in exposing himself or being exposed to certain physical and moral risks or in the commitment of acts which were in conflict with the law.

Such legislation required a definition of age limits. The trend throughout all civilized countries is in the direction of increasing the period of protection. The Roman law recognized the child under seven as lacking in responsibility, so far as delinquent acts were concerned. Early legislation restricting the labor of children began at almost as low an age limit.

The state is now clearly extending its jurisdiction to include the activities of children during their late adolescence and after. Recently several states have extended the jurisdiction of the juvenile courts, in one instance to the age of twenty-one. For the most part, in one third of the states jurisdiction of juvenile courts extends to children under sixteen, in another one third to children under seventeen and only in the remaining third to children under eighteen. In some instances where juvenile court control has not extended beyond sixteen some attempt has been made, as in the legislation of Illinois and Michigan, for separate court handling of the older adolescents.

In the conference on uniform state laws in August, 1930, there was adopted for recommendation to the various states with the approval of the American Bar Association a uniform state child labor act fixing the upper limit of legislation at twenty-one and the lower age at fourteen. This lower limit is below the standard set by seven of the states and by certain European countries. Little progress is reported, however, for the child in domestic service and agricultural labor. The period in which education becomes not only a right but a duty of the child has been correspondingly raised and the tendency is toward compulsory school attendance until the sixteenth year with some provision, where this is not absolute, for continuation school education between the ages of fourteen and sixteen. Most outstanding in this respect was the Fisher Educational Act of 1918 passed in England during the war in spite of the shortage of labor.

Similarly there has been an advance in the raising of the age of consent to sixteen, as well as in the raising of age limits in legislation which attempts to diminish the physical and moral risks to children, such as legislation prohibiting the sale of intoxicants, drugs, tobacco and the like to minors and prohibiting their presence in places and under conditions of moral and physical hazard, a category in which motion picture houses have recently been included.

Until the beginning of the twentieth century child welfare legislation displayed a vast indifference to causes and an easy contentment with rather superficial treatment of results. In the last thirty years, however, the scope of legislation has been immeasurably broadened in all countries; the number of groups aided has been increased and preventive as well as remedial measures have been emphasized. In the

comparatively new field of health legislation, provisions for the physically handicapped and for the mentally retarded and defective child have been numerous and far reaching.

The first type of remedial legislation to enlist the activity of national governments referred to specific types of the more brutal and spectacular abuse or neglect by parents. Whereas in other countries legislation has vested these protective powers and the execution of remedial measures in the state or local civil departments or courts, in England, Canada and the United States specialized protective bodies privately financed and controlled, although under public supervision, prevail.

Legislation with regard to delinquency has advanced not only in the classification of the delinquent child apart from the adult delinquent but in the creation of special courts to deal with his problems. The juvenile court movement was inaugurated with the establishment in Illinois of the first children's court in 1899, but other countries have in recent years made advances beyond those of the United States. In England, Germany, France, Austria and Canada, for example, the so-called children's courts are restricted to a much more limited field of operation than the courts of the United States, which, following the Illinois pattern, include problems of personality and behavior, mentally defective children, truants, dependent and neglected children, as well as of custody and guardianship. Moreover, European practise emphasizes the educational rather than the punitive approach to many cases, such as those concerned with truancy and the adolescent sex interests of children, and has developed treatment on the basis of social and psychiatric inquiry—a procedure possible because of the smaller number of cases within juvenile court jurisdiction.

There has been a new legislative attitude toward a hitherto underprivileged group—children born out of wedlock—which is expressed as much in the elimination of such terms as "bastard" in legal phraseology as in the placing of such children on an equal status with children born in wedlock. This is especially true in the radical legislation of Soviet Russia with regard to the responsibility of both parents and of the state. In the United States the disclosure of a death rate approximately three times as high among these children as for children of married parents indicated in part a very insecure economic status on the part of the mother; the uniform illegitimacy

law, framed in 1922 by the commissioners on uniform state laws and now adopted in seven states, is essentially a support measure. Under this law both parents are liable for support, and the father's responsibility through an order of support continues until the sixteenth year. There is continuing responsibility by the court, with a degree of privacy lacking in earlier legislation. Similar legislation exists in the German states, in Austria, the Scandinavian countries, Holland and England. State guardianship for children of unmarried parents does not exist in the United States except in Minnesota.

Legislation with reference to adoption is closely related to the welfare of children of unmarried parents, since such children are those most likely to be considered for adoption. It has been recognized as fundamental in every country which has a sound welfare program that legislation prohibiting traffic in babies and controlling "baby farming" and other forms of care by unregulated persons or by corporations must come within the scope of state activity. It has been recognized too that the line between child welfare legislation and other forms of public welfare legislation is difficult to draw, as for instance in measures which tend to give equal guardianship rights to both parents and in world wide enactment of mothers' pension legislation, which extends to the home the sphere of state aid for dependent children.

Because of the great divergences among the practises of various states and countries and in details and interpretation, it is difficult to do more than to state general trends in child welfare legislation. The legislation in each of the following countries is significant as a whole. England, Germany, Austria, the United States, the Union of Soviet Socialist Republics, France, Japan, Sweden, Finland, Norway, Mexico, Argentina and Denmark. The great differences in the laws of the different political units of the United States are clearly brought out in a recent compilation which gives more than 20,000 references to the social welfare laws of forty-eight states.

Progress in unification has taken place along two lines: first, in the broadening of territorial scope and, second, in the codification and unification of provisions of a particular territorial unit. Outside of the United States the chief public force making for territorial enlargement is the Child Welfare Committee of

the League of Nations. This committee recently published a report on conditions among indigent alien children, which recommended that they be given the same rights to care and education as native born children. Many European countries have made reciprocal agreements, some of which date from before the war, containing provisions as to employment, repatriation and the care of alien minors.

In the western hemisphere international co-operation for working out standards of legislation has come through the establishment in 1924 of the American International Institute for the Protection of Children. In the United States the state provisions restricting importation or exportation of children from or to other states for adoption or placing have been fewer in number than those which provide for children within their immediate jurisdiction. Several efforts have been made to remedy the confusion and shortcomings of varying local and state standards which exist because of the limitations to federal action involved in the states' rights doctrine. These efforts have been made more often by advisory or research bodies than by direct legislation. Chief among them were the White House conferences of 1909 and 1919 on the care of dependent children. The recommendations of these bodies have had wide influence on state legislation; and the movement for the constitutional amendment to make possible federal control of child labor, as well as the Sheppard-Towner Act of 1921 giving more than six years of federal government aid to mothers and children, was an almost direct result of these conferences.

Unification of legislation within a given territorial unit received its first impetus in the enactment of the Children's Charter or Act which became the law of England in 1908. This was followed by similar movements in Belgium in 1912 and in other European countries. In the United States the influence of this movement was salutary. The establishment of a federal Children's Bureau in 1912 for the purpose of research and recommendation on all phases of child welfare was world wide in its significance and other countries have established similar bureaus. Another result was the setting up of commissions for the purpose of enacting unified codes. The first of these was in Ohio, which enacted such a code in 1913. Since that time twenty-nine states and the District of Columbia have appointed commissions to study the need for such legislation and have adopted

unified children's codes. Although many of these commissions have no public funds at their disposal, the assistance of such governmental bodies as the Children's Bureau has been invaluable.

On the whole, European countries excel the United States not only in the provision of centralized bodies for child welfare administration but also in a better trained and more experienced officialdom and in the use of more advanced social technique, especially in children's court work. Much legislation has been passed since 1920 in the United States involving the complete reorganization of old state departments of welfare or charity or the creation of new bodies. California, Alabama, New Jersey, New York, Pennsylvania and the province of Ontario are political units in North America which have reorganized and centralized their child welfare activities.

The chief task which remains in the field of child welfare legislation is that of raising and broadening its standards to include groups and ages which should be but are not yet covered by legislation and of providing unified codes for various local units, states and countries. There is also developing within the United States in some quarters a belief in the principle prevalent in other countries, that public welfare activities should extend beyond the supervision of private agencies, which must necessarily be limited in territorial scope and in power, and that public funds instead of being granted as subsidies to private agencies in the field—a practise peculiar to the United States—should be increased and expended by public officials through public departments of welfare.

CHINESE LAW. *See* LAW.

CHINESE PROBLEM. The Chinese problem consists in reality of two problems logically separate which, through a chronological accident, have become confused, resulting in a compound problem of extraordinary complexity.

The first of these two problems is one which has repeatedly arisen in Chinese history and is apparently the result of a constitutional malady of the traditional Chinese social and political system. It seems to spring from the inevitable

degeneration of imperial dynasties and the consequent incapacity of the reigning houses to produce an indefinite succession of rulers capable of performing satisfactorily the exacting social and political duties required of occupants of the Dragon Throne. No better way was ever discovered for effecting the necessary periodical changes of dynasty than a free fight.

The Manchu dynasty was one of the most powerful which ever reigned in the Far East and produced some rulers who deserve to rank among the greatest which history records. Under the leadership of K'ang Hsi and Ch'ien Lung the people of China attained unprecedented numbers and wealth, art and literature flourished and Chinese civilization enjoyed great prestige wherever it was known and understood. Although the office of emperor was by no means the despotic institution which the West has commonly supposed oriental monarchy to be, it was of great importance in the Chinese social and political system; and the selection of a new dynasty at the time of the degeneration of the Manchus was at best a difficult matter. The occupant of the Dragon Throne was the symbol of unity in an empire comprising an area greater than that of all Europe and a population possibly as great as that of western Europe and Russia together. A dynastic fight in so vast a country with such imperfect means of communication was necessarily a long and painful process. Nevertheless, the foundations of Chinese society were strong enough to be little affected by struggles for the throne. The classical rules of law and order were enforced chiefly by the heads of families under the time honored patriarchal system; the authority of the patriarchs and other local dignitaries was supported by that of the mandarins charged with the practical administration of affairs beyond the competence of the local authorities. Under this old order the vicissitudes of imperial politics greatly stirred the surface of Chinese society, but underneath life continued the even tenor of its way. The most rebellious though the least revolutionary of peoples, the Chinese were capable of dealing well enough with the problem of the imperial succession as long as they were undisturbed by alien forces.

The opening up of China to intercourse with the West, however, rendered the Manchu collapse a far more serious matter than that of their predecessors, the Mings. It is this penetration of China by western influences which constitutes the second element in the compound

problem, an element which from the standpoint of the old fashioned Chinese is a kind of casualty rather than a constitutional malady.

Toward the middle of the nineteenth century, after three centuries of largely fruitless attempts, western naval and military superiority extorted from the reluctant orientals the privilege of more intimate contact. Although the introduction of Buddhism from India in the first centuries of the Christian era profoundly affected Chinese life and culture, the economic, social and political consequences following contact with western civilization and the introduction of modern capitalism and science have been much more revolutionary. At this period the West itself was undergoing a profound transformation, and the Chinese were exposed not only to a foreign culture but to a foreign conflict of cultures. The nineteenth century warfare between western religion and natural science was succeeded by the twentieth century struggle between western capitalism and imperialism, on the one hand, and Marxian socialism and the Communist International, on the other. Contemporary China, invited and impelled to abandon its own time honored civilization for that of the modern West, has been faced also by the problem of choosing between the various cultures which a changing, confused West has sought to thrust upon it.

These social convulsions, combined with military disturbances normal to a change of dynasty, have created in contemporary China an unparalleled scene of confusion and disorder. Not one but half a dozen revolutions create the Chinese problem. There is revolution in agriculture and in industry, by which four hundred million "farmers of forty centuries" and mediaeval craftsmen are adjusting themselves to the new situation created by the division of labor, the utilization of mechanical power and the organization of the world market. There is a revolution in politics, by means of which the Chinese seek to reorganize their state so that it may be strong enough to maintain the universal external conditions of social order under the exigent circumstances of the modern world. There is a social revolution, by which the social relations appropriate to the Great Society are being substituted for the patriarchal family system. There is a revolution in morals, by means of which the Chinese seek to adapt their ancient classical piety to the requirements of the new nationalism. There is a revolution in art and literature, as new standards of taste and

new cultural ideals contend with the traditional forms and methods of emotional expression. Finally, new philosophies of life are challenging the intellectual foundations of the old order. The humanism of Confucius and the superhumanism of Gotama are being forced to defend themselves against the worldliness of science and the otherworldliness of Christianity.

The intellectual revolution is the one which up to the present has made the least progress. Organized Christianity after four centuries of effort has succeeded in converting less than one percent of the Chinese people to Christianity in any of its forms. Although Roman Catholicism claims the greater part of the Chinese Christians the Roman Catholic Chinese have made no deep impression upon their fellow countrymen. The Protestant missionaries, who first invaded China in the nineteenth century, have been more influential than the Catholics in recent years among the upper classes. But although they have made more converts among the present rulers of the country they have no such following among the masses as the Catholics, and their powerful converts show little disposition to promote the propagation of the faith. Chinese Buddhism, unlike that in Japan, has failed to catch the social spirit of modern Christianity from either Catholic or Protestant teachers, and the future of religion in China is obscure and dubious. The efforts of missionaries to introduce western systems of education have been much more successful. Western educational institutions have put the Chinese in touch with modern science, for which they have shown a rapidly increasing appreciation. More slowly than in Japan but just as surely a Buddhist people is accepting the science of the West while rejecting its religion.

A revolution in Chinese art and literature, the venerable and impressive history of which pervades all Chinese civilization, accompanies the reception of western science. Although the poverty of the masses and the indifference of the rulers of the country to the artistic functions of the state have unduly restricted gratification of the artistic impulse, aesthetic sensibilities, expressed through a love of flowers, gardens and landscape architecture, painting and poetry, a well developed theater, a highly cultivated culinary art and social etiquette and such a refined form of play as philosophic discussion, are undoubtedly acute in China. The introduction of western motion and sound pictures has made possible the immense popularization of

new art forms, and the efforts to produce a new literature in the vernacular are harbingers of a new literary age. Changes in the intellectual outlook of the Chinese are likely to occur even more rapidly in the future than they have in the past and must have consequences in all aspects of Chinese life.

The industrial revolution in China has made comparatively slow progress in agriculture, as it is hindered by the poverty of the peasants and the constant fighting among rulers. For the most part China's "farmers of forty centuries" continue to practise an agricultural technique which has been little changed during a thousand years. To be sure, a beginning has been made in the introduction of farm machinery, especially in the grain growing regions of North China and Manchuria, and there have been some efforts to improve seed selection and to eliminate destructive parasites, especially in sericulture. Agricultural experiment stations have been established by several mission colleges, which have made important improvements in the cultivation of cereals and of silk. Tobacco companies have made systematic efforts to introduce and improve the cultivation of tobacco. A noteworthy experiment is that fostered by the China International Famine Relief Commission for the establishment of cooperative agricultural credit societies. Above all, the construction of better roads and the introduction of modern transportation are making possible more efficient marketing. In central and southern China, where rice is the leading crop, a revolution in agriculture is probably not to be expected in the near future, but in the wheat and corn belts of the north more rapid changes seem likely to take place. Although the backwardness of the Chinese farmer has already lost him the bulk of the silk and tea export business to his competitors in Japan, India and Ceylon, the extraordinary expansion of the soy bean industry in Manchuria demonstrates what can be done on Chinese soil by modern methods. With the restoration of political stability these methods will undoubtedly be rapidly and widely introduced; their importance will be incalculable, for the bulk of the population still lives on and by the soil.

Much more striking has been the mechanization of urban manufacturing. The introduction of factories, steam, electricity and gas engines, begun before the World War, has proceeded rapidly since its close, especially in the larger treaty ports. The growth of the textile industry

in eastern and central China, especially in Shanghai and Hankow, where cotton mills have sprung up in great numbers, and of flour milling in the grain growing regions of the north, attest the facility with which Chinese capital can accommodate itself to western factory methods. Exact statistics are lacking for the measurement of these developments, but the expanding volume of bank clearings and international trade clearly reveals the increasing productivity of Chinese industry. Large scale industry has brought with it western forms of business enterprise, notably the limited liability corporation, and the development of a huge class of dependent wage earners. The thoroughly occidental spirit of the revolution in Chinese industry since the World War is indicated by the rapid organization of labor unions and the ready response to socialistic and communistic propaganda among suffering, discontented factory workers. But these class conscious factory workers are only the advance guard of the proletarian masses which the industrial revolution will eventually produce in China. Although the Chinese federation of labor at the height of its power in 1927 claimed several million members, the bulk of the urban population remains devoted to the practise of the arts and crafts as in Europe a century ago. It is, however, increasingly fearful of the loss of employment threatened by the rising tide of factory made goods. There has been in China no nineteenth century transition from the old order of handicrafts and domestic economy to the new order of the giant factory.

The revolution in Chinese society which accompanies the revolutions in industry, in art and literature and in philosophy introduces further complications. The social order in China, since the dawn of Chinese civilization, has been the patriarchal family system, and upon this foundation has been erected the whole superstructure of Chinese morals and politics. But now the patriarchal system has come into conflict with the individualism of the modern business man and the socialism of the modern wage earner. The authority of the patriarch is being challenged by that of the captain of industry and of the labor organizer. From an inveterate family conscious people the Chinese are about to become a business corporation, trade union and state conscious people. The old fashioned "big" family under the traditional domination of the grandfather is breaking down into the modern "little" family with the father

at the head. Sons and daughters are acquiring a new freedom as in the West, and paternal as well as grandfatherly authority enters upon a decline. In nothing is the new social order more strikingly manifest than in the changing position of women. The young women of China are leaving the ancestral home for the college and university as well as for the factory and department store and, like their brothers, are learning to look to New York, Paris or Moscow for their ideas not only of economics and politics but also of social order and discipline. Thus the social revolution brings with it a revolution in morals. The emancipated young woman insists on bobbing her hair, shortening her skirts and choosing both her occupation and her husband. The cigarette—but not yet chewing gum—becomes a popular indulgence with both sexes, and youth dances in public and pursues other novel western pleasures to the accompaniment of much shaking of heads by the elder generation.

All these revolutions in philosophy, literature, art, industry, social organization and morals **conspire** to produce an unparalleled revolution in Chinese politics. This least revolutionary of peoples must suddenly and simultaneously replace not merely a degenerate dynasty but also the crumbling foundations of the state itself.

There has been, consequently, an effort in the first place to strengthen the state so that the people may assimilate western culture at their own pleasure instead of at the pleasure of foreigners exploiting a sudden superiority either through veiled arrangements such as treaty ports and spheres of influence or through organized violence. Under the Manchus the Chinese Empire was not a state in the western sense of the term, but rather a system of international relationships. By means of the imperial authority, when the empire was in good working order, the peace was kept throughout the Far East and the various subject peoples were made free to manage their local affairs in their own way. But the exigencies of the revolution have called up a developing nationalism like that of the peoples of the West, in order that the Chinese may be able to stand alone under strenuous modern conditions. This movement has been expressed in part in such efforts to throw off foreign control as the Boxer Rebellion and subsequent periodic outbreaks of anti-foreign feeling like that of 1925-26, attended by violence, a boycott of foreign goods and the Kuomintang's drive for power. The effort to create a strong national state has induced an

attempt to form a competent central government and vigorous provincial and local governments, all sustained by the organized opinion of a patriotic people. To this end Chinese reformers and revolutionists have agitated for western political devices, notably representative and popular government in the technical sense of the terms, to be established in combination with those features of the ancient political system which have not outlived their usefulness. The revolutionary trend has been in the direction of a democratization of Chinese political institutions through a reconciliation of Chinese political philosophy and western political science. Finally, so that the people of China may obtain from their rulers such services as citizens of a modern state have a right to expect, there has been a demand for the expansion of the functions of the state.

The late leader of the Chinese revolutionists, Dr. Sun Yat-sen, had in mind such changes when he formulated the famous revolutionary creed known as the "Three Principles of the People." He declared for a state with a government which would be indeed a government of the people, by the people and for the people; that is, one based upon the principles of national independence and popular sovereignty and designed to promote the general welfare. These principles of nationalism, democracy and what for lack of a better name may be called socialism the Chinese revolutionists emblazoned upon their banners; and they attest the impact of western civilization upon the ancient culture of China as surely as do sewing machines, machine guns or motion picture palaces.

Dr. Sun provided the Chinese revolution with a plan of action as well as with a set of principles. In accordance with this plan the revolution will pass through three stages. First comes the stage of military operations, during which the revolutionists will overthrow reactionary forces still surviving in China and establish themselves in power. The second stage is that of political tutelage, during which the revolutionists will educate the people in the duties of modern citizenship and their leaders in the duties of statesmanship. The government of China during this stage will be a dictatorship of the revolutionary party. The third stage is that of constitutional government, to be ushered in after the gradual introduction of local and provincial self-government has laid the foundations for nation wide democratic institutions. In addition to this theory of revolution Dr. Sun

contributed to Chinese political philosophy a theory of education and a theory of government. The classical political philosophers had always insisted upon the importance of right education for the rulers of the state but had paid little attention to the education of the people. Dr. Sun insisted upon the education of all the people, but recognized a distinction between those who were naturally fitted for the conduct of public affairs and those who were not. The latter, he urged, should be trained for citizenship, while the former alone should be trained for statesmanship. Thus it would be possible to reconcile the institutions of modern democracy with the system of selecting by competitive examination public officers who might be removed upon impeachment by the censors, which is one practice of the old empire still serviceable. Whatever may be thought of some details of Dr. Sun's program, his plan is based upon a political philosophy comparing favorably with that of any other modern revolutionary leader.

Confidence in the capacity of the Chinese to regenerate their state has been much shaken by the turmoil and confusion which have accompanied the overthrow of the elite Manchus and the downfall of the old fashioned mandarins. The student body, indoctrinated with revolutionary theory, acts as an advance guard, but the most effective mass leadership seems still to be exercised by generals fighting for power, who despite their show of respect for the ostensible principles of the revolution bring little substantial change into political practice and whose reckless soldiers continue to overrun the country. Politics is with difficulty distinguished from civil war, and even as such it does not represent simply the conflict of drives binding the Chinese people but in some measure also the influence of foreign powers on whose support, financial or otherwise, the military overlords rely. Since the revolutionists drove the last of the old militarists from Peking there has been a revolution of colors throughout China, but military dictatorships continue for the most part to dominate the political scene. The revolutionists proclaim the end of the period of military operations and the beginning of the period of tutelage, but still there seems no better way of changing the men at the head of the state than by fighting. Nevertheless, it is difficult to believe that the Chinese will ultimately fail to regenerate their state in accordance with the plans of the revolutionary leaders, unless the memory of their past can be blotted out and

their exposure to the influence of the West thoroughly brought to an end.

CHIRONI, GIAMPIETRO (1855-1919), Italian jurist. Chironi was professor of private law at the University of Turin for thirty-three years and held many public offices. He began his career at a critical period in Italian law. With Cimbali, Gianturco and Polacco he played an important part in the discussions on method (which led to the adaptation of German methods in the study of Roman law), contributing to the regeneration of private law studies in Italy. This new method was adopted by Chironi in his *Trattato di diritto civile italiano* (Turin 1904) in collaboration with his pupil Abello. Italian juridical development, however, had probably not yet reached a sufficiently advanced stage to enable Chironi to build the system he had framed, and the work was interrupted at the first volume. He was most successful in filling existing gaps in his *La colpa nel diritto civile italiano* (3 vols., Turin 1884-87; 2nd ed. 1896-1906), which considers every aspect of the doctrine of torts. There followed *Trattato dei privilegi, delle ipoteche e del pegno* (2 vols., Turin 1894-1901; 2nd ed. 1917), in which he expounded a general doctrine of security. Chironi's numerous periodical publications were collected

in four volumes as *Studi e questioni di diritto civile* (Turin 1915), and a fifth volume, *Nuovi studi e questioni* (Turin 1922), was published posthumously. It is in these five volumes particularly that a clear statement of general conceptions is to be found. He held that modern law is but a consequence of historical evolution; hence no interpretation is possible apart from history and comparison. He insisted, moreover, upon the necessity of combining the study of ancient Italian law with that of contemporary foreign legislation. The *Istituzioni di diritto civile italiano* (2 vols., Turin 1888-89; 2nd ed. 1912) reflects Chironi's whole academic activity and represents a synthesis of his intellectual resources.

MARIO SARFATTI

CHIVALRY

EUROPEAN. Chivalry was one of the great representative institutions of the later Middle Ages in Europe; it marked the transition of society from the anarchy of feudal war to the settled civility of peace and order. In whatever age or clime this transition occurred some organization of a chivalric character tended to spring up, and thus chivalry had close affinities with similar institutions in other regions and in other periods of history, as for example with Bushido in ancient Japan.

Chivalry as such, however, was peculiar to mediæval Christendom and we are here concerned with no other form than that which arose in western Europe at the time of the crusades. The eleventh century saw its initiation, it was at its height during the twelfth and thirteenth; and the next two centuries witnessed its degeneracy and decline.

In its complete and final form chivalry was a curious and rather incongruous amalgam of three distinct elements: war, religion and sexual love; but common to all three was the factor of "service." The true hero of chivalry rendered service—voluntary, unrestricted, lifelong, without thought of self or of remuneration, a service which, however lowly, involved no degradation—first to his feudal lord, secondly to his divine sovereign and thirdly to his lady love. The link between war and religion was the crusades; the link between religion and love was the worship of the Virgin Mary, which was peculiarly developed among the crusading orders.

The military element, which was basic, can be traced back to remote times. William Caxton, the English printer, in his preface to *Ramon*

Lull's *Book of the Ordre of Chyvalry* (1484), claimed for knighthood an antiquity not less than that of Adam and Eve, asserting that it was the earliest divine device for the recovery of the human race from the ruin of the fall and identifying the archangel Michael as the first knight. Scientific history has not as yet verified this hypothesis. It is content at present to trace the military element in European chivalry to the Teutonic *comitatus* as described in chapter thirteen of the *Germania* of Tacitus. It seems to have been the custom for German boys of good birth to enter the service of kings and chiefs, to be trained in the use of arms and, when they attained maturity, to be formally admitted by the ceremonial girding on of a sword into the select company of the companions of the lord. The *comites*, or *gesiths*, thus initiated were bound to the lord by ties of inviolable loyalty; they pledged themselves to remain faithful to their captain even unto death. The lives of the Merovingian saints reveal the system as still in full working order among the Franks of the seventh century. Not, however, until Carolingian times did it reach its full development or receive its most important extensions. During the mayoralty of Charles Martel (714-41) the Frankish kingdom was threatened with extinction by Moorish hosts from beyond the Pyrenees. In the ninth century, after the death of Charlemagne in 814, great invasions of Vikings, Magyars and Slavs further menaced the existence not merely of the Franks but of Christian civilization itself. The central government of the Franks was unable to cope with these new perils. To meet them hitherto independent freemen "commended" themselves to the local lords, rendering them service in return for protection, helping them to fortify, defend and provision their castles and receiving from them shelter and support in times of stress. On the other hand, bodies of *caballarii*, or horse soldiers—the only type of military power capable of meeting and repelling the invaders—were formed; these were bound to the service of the kings or local lords who conferred upon them grants of land for the maintenance of themselves and their numerous attendants. Thus from the threefold source of *comites*, *commendatores* and *caballarii* sprang the institution of feudal knighthood, the nucleus of militant chivalry.

The virtues or merits of feudal knighthood were "valour, troth, and largesse." Its counter-vailing vices or defects were extreme quarrelsomeness and pugnacity, merciless cruelty to

the vanquished, lack of a sense of common humanity, faithlessness to those outside the circle of feudal obligation and frequently an impious disregard of religion. The limits of feudal obligation were, moreover, exceedingly narrow, and beyond them lay vast regions wherein the feudal knight roamed as a wild beast seeking his prey. The authentic story of the English bandit earl Geoffrey de Mandeville and the legendary romance of the French robber knight Raoul de Cambrai are alike eloquent of unmitigated savagery.

No doubt the qualities of the lion and the tiger, properly attributed to them by Flach, were those demanded of the defenders of the relics of Roman culture against the fierce invaders of western Europe. By 1000 A.D., however, the period of their usefulness was over. The invaders of Christendom had been either driven off or reduced to order, and in a period of organized central government the feudal knighthood remained a dangerous and obstructive anachronism. In its impregnable castles, no longer needed as places of refuge from alien raiders, it defied the royal authority; its mailclad cavalry, no longer usefully employed in beating back hordes of Saracens or Danes, infested the countryside, keeping the whole of Europe restless with private war. The church achieved a degree of success little short of miraculous in the task of taming the measureless ferocity of knighthood. Under church influence religion was associated with war, and the service of God was superimposed upon the service of the feudal lord.

In the early days of Christianity, while the Roman Empire was still pagan, the church had wholeheartedly condemned war as devilish and had encouraged the primitive believers to decline service in the imperial armies. After the conversion of Constantine in the fourth century, war in defense of Christendom, for the propagation of the faith or for the suppression of heresy, had been recognized as a legitimate if regrettable instrument of the divine will. After the rise of Islam in the seventh century it became still more generally recognized that the church might properly be militant here on earth; for it appeared that only with the sword could Christendom save itself from annihilation by the militantly proselytizing Moslems. It was not, however, until the Seljuk Turks captured Jerusalem in 1076 and commenced the systematic persecution of Christian pilgrims that the church proclaimed war to be the supreme duty of the knighthood of Europe. The formal consecra-

tion of war as an instrument of religion may be said to have occurred at the Council of Clermont in 1095, when Pope Urban II proclaimed the first crusade and when amid scenes of indescribable enthusiasm the assembled knight-hood, priesthood and populace of Europe took a solemn oath to rescue the sacred sepulcher from the hands of the infidel. The great cry, "It is the Will of God," marked the conversion of feudal knighthood into Christian chivalry.

The period of the great crusades lasted from 1095 until the final expulsion of the crusaders from the Holy Land in 1291. That period was the so-called "golden age" of Christian chivalry, when the church made strenuous efforts to control war, to direct it to holy ends and to mitigate its ferocity. It succeeded warily in exalting and refining the ideal of knighthood. To the primitive Teutonic virtues of courage and constancy it added the Christian graces of piety, humility and the general service of the weak and oppressed. The Council of Clermont itself had decreed that every boy of noble birth, when he attained the age of twelve, should take an oath before his bishop that "he would defend to the uttermost the downtrodden, the widow, and the orphan." The pagan Teutonic ceremony of sword girding was converted by the church into a solemn ordination akin to that which signalized the entry of a priest upon his sacred duties. The prospective Christian knight was made to pass through a bath, emblem of purification from sin; he was clothed in garments white, red and black, symbolic respectively of innocence, sacrifice and death; he was required to perform an all night vigil in a church, followed by confession, mass and sermon; the sword with which he was to be girt was consecrated to the service of God; vows of obedience and chastity were imposed upon him. Only after the church had dealt with him for twenty-four hours was he surrendered, semi-ordained, to his feudal lord to be invested with his weapons, to receive the accolade, to be placed upon his horse and to be put through his military exercises.

While it is true that in every generation there shone forth brilliant examples of consecrated militancy, it cannot be said that the Christianized knighthood of the golden age of chivalry generally lived up to the ideals of its ordination. The records of heroes like Godfrey of Bouillon, Tancred of Sicily, William Marshall, Saint Louis and the Cid are eloquent of the influence of religion in exalting and purifying the standards of knightly character. But, in general,

violence and lust proved too strong to be mollified and subdued by the discipline of the church. The records of the crusades from the *Gesta francorum* at the beginning to the chronicles of Joinville at the end of the period bear overwhelming testimony to the fact that no purification, no ordination, no exhortation, no conjuration, sufficed to keep the chivalry of Christendom within the bounds of decent behavior. The scenes enacted in 1096 as the first crusaders made their way through Hungary to Constantinople would better have befitted a horde of marauding vikings than the soldiers of the Cross and, similarly, the orgies that disgraced the camp at Damietta in 1249 during the last but one of the great crusades, under the very eye of the saintly Louis IX, showed that the knighthood of Christendom remained unregenerate still.

The nearest approach to the effective harmonization of religion and war was seen in the institution of the great crusading orders of knighthood. The Hospitalers, or Knights of St. John of Jerusalem, existed as a charitable order in the middle of the eleventh century, before the Holy City fell into the hands of the Seljuk Turks in 1076. Their function was to establish and maintain hostels for the shelter and comfort of Christian pilgrims. The capture of Jerusalem and its recovery by the crusaders in 1099 drew the Hospitalers from innkeeping into belligerency, and in 1118 one section of the order was formally converted into a militant knighthood. Jerusalem remained the headquarters of the order until 1187, when Saladin recovered the city for Islam. For the next hundred years Acre was its base. When Acre was lost to Christendom the order moved in turn to Cyprus in 1291, Rhodes in 1310 and finally Malta in 1530. The capture of Malta by Napoleon in 1798 virtually extinguished it.

The Knights Templars were a militant organization from their first institution in or about 1118. On the one hand they were monks of the strictest and most ascetic Cistercian type, pledged to chastity, obedience and poverty; but they were also knights bound by their vows to wage truceless war upon the infidel until the church should be universally established. For a short time they seemed to be the very embodiment of crusading zeal; popes blessed them, councils confirmed them, the saintly Bernard himself framed their statutes and composed in their favor a notable treatise *De laudibus novae militiae*. But popularity soon corrupted them and lavish benefactions demoralized them. They be-

came lazy, self-indulgent, proud, quarrelsome, lawless. When they were expelled from Jerusalem in 1187 and from Acre in 1291, unlike the Hospitalers they found no new home and no new work to do. Suspected of heresy, accused of shameful vice and having unmistakably outlived their usefulness, they were suppressed in 1312.

The Teutonic Knights, founded about 1128 by a wealthy German, combined the care of the sick and poor with the profession of arms. On the expulsion of the Christians from the Holy Land in 1291 they moved to Venice but soon found a new sphere of crusading activity on the confines of their own country. In 1309 they fixed their headquarters in Marienburg on the Baltic and from that base undertook the task of conquering and evangelizing the heathen of Prussia, Lithuania and Esthonia. In Prussia they remained, with many fluctuations of fortune, until the time of the Reformation, when their grand master, Albert of Hohenzollern, accepted Lutheranism and converted his elective mastership into the hereditary dukedom of Prussia, held as a feudal fief from the king of Poland.

During the twelfth and thirteenth centuries both the Templars and the Hospitalers rendered aid to the Christian kings and counts of the Spanish peninsula in their secular conflicts with the Moors. Such assistance, however, was spasmodic and inadequate, and from the middle of the twelfth century separate orders were instituted for this purpose. Of these the four most important were those of Calatrava (1164), Avis (1166), St. James of Compostella (1175) and Alcántara (1183). Together they played a prominent part in achieving the great victory of Las Navas de Tolosa in 1212 by which the Moorish ascendancy in Spain was finally overthrown.

These crusading orders, whether in the eastern Mediterranean or the western, marked the nearest possible approach to the harmonious blending of war and religion—knighthood and monkhood—in the institution of Christian chivalry. But long before the period of the great crusades had come to a close a third element had added itself to war and religion as an ingredient in the ultimate chivalric mixture. This was the curious and apparently incongruous element of "gallantry," or pursuit of woman. The crusading orders, it is true, had from their initiation been conspicuous for their devotion to the Virgin and for their veneration for the holy women of the calendar. All knights, moreover, from the time when the church took their ordination in hand, had been specially sworn to serve as the protec-

tors of female weakness against the violence of dragons and the machinations of devils. No doubt the habitual contemplation of feminine sanctity and the constant search for adventures on behalf of distressed maidens predisposed the lusty horsemen of Christendom to that passionate transference of their devotion from the ideal to the actual and from the general to the particular which was involved in "gallantry." But "gallantry" itself was by no means of ecclesiastical origin, nor was it ever regarded with anything save severe disapproval by the church. Its incorporation into chivalry implied a deep degradation of knightly standards of conduct, and the social evils which resulted from its prevalence ultimately necessitated the suppression of chivalry itself as a recognized institution. For "gallantry" was nothing more or less than conventionalized adultery and socialized bigamy.

Marriage among the secular knighthood of Christendom was little more than a consecrated feudal incident, usually arranged, without the consent or even the cognizance of the persons primarily concerned, by lords or guardians who had purely business interests in mind. Hence a knight was not expected to love his wife, and his erotic passion was usually lavished promiscuously, irrespective of laws, on all and sundry who would accept it.

This errant passion, or bestial lust, was little affected by extreme clerical views on the virtues of ascetic celibacy. The troubadours, however, by means of their exquisite lyrics gave an aesthetic decoration to sexual love and concentrated the wandering passions of the erstwhile errant knight on one sole object. It came to be regarded as proper that every knight should have, in addition to the wife appendant to his fief, a lady love to whom he gave the devotion of his heart and on whose behalf he did desperate deeds in tournament and in war. As the inevitable counterpart of this bigamous system it had to be recognized that every lady might be expected to have both a husband and a paramour. If northern France, and especially Normandy, was primarily the home of that blend of militancy and piety that led to the crusades, so was southern France, and especially Provence, the main source of that poetic "gallantry" that leavened all the later mediaeval chivalry. It was not until the thirteenth century, when Provence was incorporated into the French system, that the full sway of "gallantry" was established. This establishment marked the beginning of the degeneracy and decline of chivalry.

In the fourteenth century the institution seemed more flourishing and luxuriant than ever before. Of all the pictures of chivalry in action those presented by Froissart in his chronicles are the most gorgeous and fascinating. Few of the ideal knights of chivalry can compare with Edward III, the Black Prince, Bertrand du Guesclin, Sir Walter Manny and Sir John Chandos. There had never been, moreover, in earlier days a more splendid creation of new knightly orders; the Order of the Garter in England (1349), the Order of the Star in France (1351) and the Order of the Annunciation in Savoy (1392) were among the most magnificent of their kind. Furthermore, never before had so much attention been paid to the education of the page (a boy of from seven to fourteen years of age), the squire (a youth of from fourteen to twenty-one) and the knight in all the exercises of war, religion and love. Never had jousts and tournaments been organized on a more splendid scale. But the institution of chivalry was on the decline. The new orders created were merely decorative. The jousts and tournaments had little relation to actual war. The training of pages and squires was as remote from the requirements of the life of the adult warrior as is the education given today in the public schools of England from the requirements of the modern business world. The aberrations of "gallantry" were ceasing to be tolerable to a society that was becoming increasingly commercial.

The advent of an effective infantry, armed with spears for defense and with deadly archery for offense—and still more the appearance of artillery capable of reducing castle walls to heaps of ruins—democratized war and made the paraphernalia of chivalry obsolete. The Hundred Years' War between England and France, the opening phases of which Froissart depicts, although it witnessed many chivalric episodes deliberately staged, was fought out by national armies in complete disregard of the principles of knightly combat. Still further removed from the realms of chivalry were the furious conflicts of the Wars of the Roses in England, the so-called "religious wars" in France or the Thirty Years' War in Germany.

Nevertheless, chivalry, although it vanished from the world of practical affairs at the close of the Middle Ages, continued to exist in the world of social convention. Such a decorative order as that of the Garter kept its fascination for the friends of kings, and new ones—e.g. the Golden Fleece in Burgundy (1429), St. Michael (1469)

and the Holy Ghost (1578) in France—constantly sprang up and attained eminence. Perrot, the historian of chivalry, was able to enumerate no fewer than 234 orders existent in 1820 and since then, especially in England, many new ones have been instituted. They have, of course, no practical significance whatsoever. They are merely inexpensive ornaments by means of which sovereigns can manifest approval of conspicuous service on the part of faithful subjects.

When Perrot published his *Collection historique des ordres de chevalerie* a curious revival of interest in mediaeval chivalry was taking place. It was one phase of that romantic reaction following the excessive rationalism and utilitarianism of the revolutionary era from 1789 to 1815. A copious literature sprang up under its influence in many European countries and even in America. Worthy of special mention are Kenealm Digby's *Broadstone of Honour* (1822), J. G. G. Büsching's *Ritterzeit und Ritterwesen* (2 vols., Leipsic 1823), G. Ferrario's *Storia ed analisi degli antichi romanzi di cavalleria* (4 vols., Milan 1828-29) and G. P. R. James' *History of Chivalry* (1830). These writers, peering through the blood-red haze of the revolutionary terror and the Napoleonic wars, dwelt upon the courage of the mediaeval knights, their piety, their devoted service to the weak and the oppressed, their fine courtesy, their delicate sense of honor. And in illustration of their theme they depicted in glowing language the noble lives and fine achievements of such selected heroes as Godfrey of Bouillon, Tancred of Sicily or the Chevalier Bayard.

This excessive eulogy of chivalry on the part of the romantics was followed by a cold douche of criticism on the part of realistic historians. They pointed out that model knights like Godfrey, Tancred and Bayard were rare exceptions in the midst of most unattractive and unedifying normalities and that, generally, chivalry was ineffective in war, obscurantist in religion and antisocial in love. They held that it glorified fighting for its own sake, that it fostered persecution and that it disseminated a gross immorality; that its courtesies were confined to a very limited class and that outside the range of its narrow sympathies it was cruel and insufferably proud.

On the whole, however, chivalry may be said to have marked an upward step in the march of humanity from savagery to civilization. In spite of its defects, it exalted the standard of honor; it enlarged the conception of generos-

ity; it attached manhood to the service of religion; it developed and instilled a fine code of good manners; and it inculcated a splendid ideal of social service.

F. J. C. HEARNshaw

ARABIC. The flower of chivalry, which, nurtured by Islam, reached its fullest bloom in Saladin and his contemporary Usamah, had its roots in ancient heathen Arabia. Particularly among the Bedouins of north Arabia do we notice those prime elements which enter into the composition of a chivalric knighthood. To the denizens of the desert fighting was a chronic mental mood, *ghazu* (razzia) a national sport, camel raiding the only manly occupation and blood feud the most important institution. One Christian tribe, the banu-'Udhrah, was proverbial for its respect for womanhood and Platonic love.

Chivalry in its primitive form, implying a body of horsemen equipped for battle, was developed in the first centuries of the Christian era with the introduction of the horse from western Asia. The horse soon became a war animal and inspired a whole literature in Arabic.

In desert land, where forage was scarce and the horse an animal of luxury, the *fāris* (horse rider) gradually became the equivalent of *sayyid* (chief). With the necessary traits of leadership he usually combined a gift for poetry, by means of which he aroused the martial enthusiasm of his tribesmen, extolling their virtues and those of their ancestors and emphasizing the weaknesses of the enemy. The Bedouins came to consider most enviable the title *shā'ir fāris* (poet knight) and to regard tribal superiority as based on horsemanship, poetry and generosity, the last as an index of wealth.

In the *ayyām al-'Arab*, the tribal combats of the pre-Mohammedan era, the early warriors of the Arabian peninsula rode forth in quest of adventure, rushing to the rescue of captive maidens, offering succor to the helpless and in general typifying the qualities of *murū'ah* (manliness) most highly prized by Arabians: courage as measured by the number of adversaries killed, loyalty as evidenced by devotion to the interests of the tribe and generosity as manifested by the readiness to slay camels for the guests.

The pages of *al-Aghāni*, *al-'Iqd al-Farīd*, and the numerous *diwāns* are replete with illustrations of chivalric virtues as well as its vices, such as persistence in revenge, intolerance of others and illicit sex relations. Al-Shanfara, Zayd al-

Khayl (Zayd of the Horses), 'Adi ibn-Hātim, 'Amr ibn-Ma 'dīkarib the champion of Yaman, Muhalhil ibn-Rabī'ah and 'Antarah ibn-Shaddād may be cited as types of pre-Islamic heroes. Al-Shanfara was taken captive while young and on his release took an oath to kill a hundred from among his captors. After making his ninety-ninth killing, so the story goes, he was himself overpowered and slain. A member of the enemy tribe, however, happened to stumble one day on al-Shanfara's skull as it lay bleaching on the ground and received a wound in his foot which resulted in his death; thus the revenge was consummated.

The name of 'Antarah has lived in Arabic literature as the symbol of chivalric conduct. This Bedouin Achilles, who flourished in the last decade of the sixth century, was the son of a black slave woman and could not therefore be regarded as a legitimate member of the family unless so acknowledged by his father. On one occasion, while his father's tribe was hotly engaged in battle, the lad refused to take part, saying, "A slave knows not how to fight, milking camels is his job." Thereupon the father shouted, "Charge! thou art free." The tale of 'Antarah's romance (*ṣīrah*), which took its present form during the crusades is still relished by large audiences in the cafés of Cairo, Beirut and Bagdad.

To these pagan Arabian rudiments of chivalry which Islam inherited, it added its own contribution. In Islam the consecration of war to the service of religion—two seemingly incongruous ideas—and their fusion into a homogeneous whole were carried to a more successful extent than in any other major religion. Of all systems of belief Mohammedanism is the only one which holds "holy war" (*jihād*) among its cardinal tenets and promises him who dies on its battlefield a passport to heaven.

Mohammed was himself an orphan who had felt the pinch of poverty, and in his social legislation favoring the fatherless and motherless, the poor, the slaves, the wayfarers, he promulgated the most humane part of his code (*Koran* 4:2,3, 40; 16:73; 24:33, etc.). To the two fundamental principles of chivalry, war and religion, the third, gallantry, was now added. Nevertheless, Arab chivalry even in its Islamic development remained a spirit, a way of life; it never became as in the Occident an organized institution. In the Moslem army of conquest the distinctive qualities of the chivalric knights, which at their best were valor, honor, piety and love and at their

worst ferocity, perfidy, fanaticism and lust, were all well represented.

The early Moslems, like the heathen Arabians, considered a man educated and cultured if he could compose in prose and verse, ride, swim and shoot arrows. Such a person was called *kāmil* (the perfect one). The first Arabic poets who wrote especially of love and sang the praises of the fair sex were all post-Islamic.

Those first crusaders who came into the Holy Land cherishing a vague idea that the Saracens were idolaters were soon disillusioned. The early contacts showed the mailed gentleman of Europe that he had met his match in Asia and that neither in magnanimity nor in military prowess was a *Cœur de Lion* superior to a Saladin.

Saladin (Ṣalāḥ-al-Dīn) exemplified all the virtues and graces of Arab chivalry. When the crusading army entered Jerusalem in 1099 it inaugurated the "kingdom of God" by slaughtering some two thousand Christians and Jews. When Saladin retook the city in 1187 he accepted ransom for men, women and children and released several thousands who could not pay. Those same women and children found the gates of Tyre closed against them by Conrad and the Italian sailors in Alexandria unwilling to take them on board without due payment. Reginald of Châtillon, who in violation of treaty terms had attacked a caravan near his stronghold Crac (Karak), fell into the hands of Saladin after the battle of Hattin in 1187. The latter had sworn to take with his own hand the life of the breaker of the truce. The prisoner was offered a cup of refreshments; but Saladin was quick to explain that since it was not ordered by him the drink did not constitute an amnesty, the Arab custom being that of considering any one safe after partaking of the hospitality of another.

It was, in fact, on the plains of Syria that European chivalry developed out of a mass of usages, mainly Gallic in origin, into an organic form. As early as the eighth century the Umayyad Caliph al-Walid (705-15) had houses built for the lepers and insane, and it was in Syria early in the twelfth century that the first formal orders of knighthood, the Hospitalers and the Templars, were established. The Order of St. Lazarus, which was founded for assisting the lepers, and the many lazarus houses which grew later in the West followed the eastern precedent.

In Spain, Cordova with its frequent jousts

and tournaments was the hearth of Arab chivalry. To the Moslem courts of al-Nāṣir (912-61) and his son al-Hakam (961-76), where a punctilious code of honor was assiduously cultivated, flocked Christian knights under guaranty of safe conduct to break lance with the Moorish cavaliers. In Granada in 1400 ibn-Hudhayl wrote *The Ornament of Chevaliers and Banner of Gallants*. The queen of Alfonso VII, besieged in Azeca in 1139, needed but to show herself at the window and the siege was immediately raised. The Cid (short for *sayyid*), the national hero of Spain, fought first with, and later against, the Moors. In French the first full portrait of a knight is that of Roland, a commander in Charlemagne's expedition against the Moslems in Spain. *Chanson de Roland* and certain products of French troubadours, as well as of German minnesingers, show clearly the influence of oriental barbs.

The Mameluke dynasty of Egypt (1250-1517), which dealt the final blow to the crusaders, was represented in the field of chivalry by Baybars (1260-1277), whose daring exploits and acts of generosity, like those of 'Antarah, are still recited throughout the Arabic speaking world. The *farrāḥ*, who figures in *The Arabian Nights*, embodies the Mameluke ideals of a hero rather than the Abbassids, as ordinarily supposed.

The beginnings of European heraldry, a direct product and characteristic token of chivalry, can be traced also to the Arab world. The crusaders brought back with them in the twelfth century the germs of heraldic bearings. Saladin probably had the eagle for crest, ibn-Tūlūn (868-77) the lion and Barqūq (1382-98) the falcon. Baybars' lion can still be seen carved on the bridge he built across the Jordan. Most of the Mamelukes bore names of animals, the corresponding images of which they blazoned on their shields. On a Zangid coin struck in Sinjār (1190) we see the double headed eagle, a bird of Sumerian origin and later adopted in Europe and the United States. The eastern origin of heraldic terms may be illustrated by such words as "azure" (Arabic) and "gules" (probably Persian). Among the Moslems of the present day the crescent and star, the lion and the sun represent the sole surviving remnants of heraldry.

CHLEBORÁD, FRANTIŠEK LADISLAV (1839-1911), Czechoslovakian economist and pioneer in the cooperative movement. In 1867, following a trip to western Europe, Chleborád published a work on the Roelldale pioneers and in the following year was the leader in the founding of a producers' cooperative in Prague called the Beehive. As its first president he was largely responsible for its success, which in turn led to the establishment of a large number of cooperatives throughout Czechoslovakia. In 1872 these numbered almost five hundred. He also founded the Slavia in Prague, the first Czech mutual company for the insurance of workers against invalidity and old age. A too rapid growth, combined with lack of experience, brought about the complete failure of most of the cooperatives in the period following the economic crisis of 1873. Nevertheless, Chleborád's pioneer endeavors greatly influenced more permanent subsequent experiments in both consumers' and producers' cooperation. In his *Soustava národního hospodářství politického* (System of political economy, Prague 1869) Chleborád stressed the role of consumers' cooperation and described its organization. In 1884 he published *Boj o majetek* (Brunn; translated into German as *Der Kampf um den Besitz*, Vienna 1885), in which he analyzed the conflicts between the propertied and the propertyless and advocated protection by society of its weaker members. He passed the final years of his life in Russia as teacher and

later as counselor in the office of the Ministry of Finance.

CHRISTIAN LABOR UNIONS. The Christian labor union movement represents an attempt on the part of Roman Catholic leaders to counterbalance the socialistic tendencies of the general or "free" labor union movement of Europe. With the exception of a small French-Canadian group and a few sporadic units in Mexico, Chile and Argentina, it is confined in the main to continental Europe, with over half of its membership centered in Germany, particularly in the Catholic provinces of the west, the Rhineland and Westphalia.

The beginnings of the movement date back to the eighties of the last century when a few Christian labor unions were founded, mostly in Germany by priests who were under the influence of the awakening of the "social conscience" among advanced Catholic thinkers. Its principles did not acquire unity, however, until after the publication in 1891 of the encyclical *Rerum novarum* of Pope Leo XIII.

There is as a general rule no essential difference within a given country between the structure, functional technique and short run industrial tactics of the Christian labor unions and those of the general labor movement; regulations and policies as to strike and other benefits are generally the same. In a few of the smaller countries, however, especially those of the Latin type, some of the organizations have a less militant and more benevolent character.

The relation to employers is practically the same in both types of labor unions. Frequent attempts on the part of church leaders to organize employers on "Christian" lines, and thus incidentally to refute the charge brought against them by the socialists of splitting only the workers' front, have been rendered unsuccessful by the preference of Catholic employers for remaining in the general employers' organizations.

As the primary justification for a separate

organization Christian labor unions have emphasized their distinctive program of deriving all demands ultimately from religious principles, and argue that joint organization with non-believers endangers the faith of Christian workers. The principles to which they adhere are those of the encyclical *Rerum novarum*: emphasis upon individual human personality but rejection of the economic liberalism of the capitalist regime, which, they hold, sacrifices the welfare of the workers to the profits of the few; belief in the necessity of social classes but denial of the Marxian conclusion that their existence entails class struggle; insistence that labor unionism should be non-socialistic; and a declaration of the universal need for association and for harmonizing divergent interests according to Christian ethics. Applied to industrial relations this doctrine has meant recognition of equal rights of capital and labor, organization of each and cooperation through such joint bodies as works councils and shop committees.

The growth of the movement was very slow until the first national unions were formed at the end of the century. The first attempt at international organization was the International Secretariat of Christian Trade Unions instituted in 1908 at the Congress of Zurich. The net result was slight. The World War checked further progress, disrupting the international bonds of the Christian unions even more than those of the general unions. The former Entente countries and the Central Powers held separate international gatherings until 1920, when the International Congress at The Hague created an International Federation of Christian Labor Unions. Congresses of the new organization were held at

Innsbruck in 1922, at Lucerne in 1925 and at Munich in 1928. The post-war fluctuations of membership have been almost parallel to those of the labor movement generally—rapid growth until 1921, marked decline until around 1925 and since then a partial recovery.

In 1928, the International reported a total membership of 1,423,227 (as against 3,035,989 in 1922), divided as shown in the table. In Italy, which had over a million members in 1922, the movement has been suppressed by the Fascists.

The seat of the International is at Utrecht, Holland, the secretary being P. J. S. Serrarens, a former teacher in the Holland schools. Its organization is rather loose and its chief business is the exchange of information and the preparation of congresses.

On the whole, membership of the constituent unions in the International Federation of Christian Labor Unions is confined to Roman Catholics. There are two types of exceptions, however, which justify the more general denomination "Christian": in Holland and Switzerland there are separate Protestant unions as well as Catholic unions; while in Germany the Christian labor unions are open to Protestants. The practical purpose of the mixed unions in Germany was, in its origin, mainly to hamper encroachments from the Roman Catholic church authorities on the conduct of union affairs, and incidentally to facilitate relations with employers of both creeds. Christian labor union doctrine justified the combination on the ground of common opposition by both ecclesiastical groups to socialism and the validity of Christian ethical principles, whether Catholic or Protestant, as applied to social problems. Although no statis-

Switzerland	Christlich-nationaler Gewerkschaftsbund der Schweiz	18,093
	Schweizerischer Verband Evangelischer Arbeiter und Angestellter	6,233

tics are available it is generally agreed that the Protestant membership in German mixed unions represents no more than a sprinkling; while the special Protestant unions in Holland and Switzerland claim an aggregate membership of only 60,000.

In Germany, although there is no formal link between the unions and the church, priests and Catholic intellectuals individually play a large part in the movement as writers, lecturers, teachers, etc. Moreover, there is a dependence based chiefly on the spiritual power of the church authorities over the individual members and a bond arising from community of creed. There is in addition a formal connection between the unions and certain Catholic organizations under direct church authority, such as the *Katholische Arbeitervereine* and the *Verband der Katholischen Jugend- und Jungmännervereine Deutschlands*. Repeated friction between the *Arbeitervereine* and the labor unions eventually led to the formation of a joint committee (with representatives also from the youth organization), the purpose of which is to eliminate overlapping activities and to cooperate in propaganda by meetings, literature, lecture courses, etc.

In Holland the Catholic unions officially recognize as spiritual advisers priests who are appointed by the bishops to control union activities, to watch over "the purity of faith and morals" of members and to report to ecclesiastical authorities on all disobedience. In Belgium the bishops for a similar purpose delegate a committee of six diocesan directors. In the Latin countries priests, monks and other persons affiliated with ecclesiastical bodies play an essential part in the conduct of union affairs, but church supervision is local and personal rather than central.

The relations of Christian labor unions with political parties representing the views of the Catholic church are, on the whole, similar to the relations of the free labor unions with the parties affiliated with the Labour and Socialist International at Zurich. In Germany the principles regulating the attitude of the Christian labor unions toward the Catholic Center party are almost exactly the same as those which regulate the relations between the free unions and the Social Democratic party: mutual independence and autonomy but personal union; support given to the party at elections; organized joint action on special issues; and mutual recognition of the party as the political representation,

and of the unions as the industrial representation, of a common outlook. The chief leaders of the Christian labor unions often represent the Catholic Center party in the various parliamentary bodies. In 1930 the general president of the *Gesamtverband der Christlichen Gewerkschaften Deutschlands*, Herr Stegerwald, was a cabinet minister in the Socialist-Catholic-Liberal coalition government of the German Republic. In contrast, however, to the harmonious role of the "free" labor unions in the homogeneous class organization of the Social Democrats, Christian labor unionists, who form the left wing of the Catholic Center party, often clash with the large middle class and capitalist groups which constitute the bulk of the party. In Austria the Christian labor unions similarly support the Catholic Christian Social party, which in practice is the most conservative. In Holland the Catholic and the Protestant unions support their respective parties, both of which are chiefly conservative. In other countries Christian labor unions are of small account politically. Needless to say, the support thus given to parties so closely associated with capitalistic interests and identified with a long historical tradition of bitter opposition to labor demands (the right to organize and strike, legalized collective bargaining, the abolition of class suffrage, disarmament and internationalism) is one of the chief arguments used by the "free" unions against the Christian unions.

Originally there was nothing but fierce hostility between the two types of unions. The power of the Christian labor unions, too small for effective pressure on the employers, was yet sufficient to weaken the workers' position by disrupting their unity. The bona fide character of the Christian labor unions was denied by the "free" unions, who charged them with being tools in the hands of the capitalists. In the pre-war period, almost any strike involving Christian labor unions led to such charges as blacklegging and being in the pay of the employers, although these extreme accusations could be substantiated only in a few local instances. The tone of the Christian labor union propaganda against the general unions was equally aggressive.

Since the war in Germany, and to a somewhat smaller extent in the neighboring Teutonic countries hostility has become much less acute. In fact cooperation, tacit or even openly organized, on all concrete immediate issues, is the general rule. Proportional representation according to membership regulates joint activities

in the innumerable bodies set up by labor legislation or collective bargaining, such as shop councils, tariff committees, economic councils, social insurance bodies and even the conference and the economic council of the International Labour Office. Parliamentary lobbying is also often undertaken jointly. In most strikes and other wage movements of the last decade there has been organized cooperation in all the stages from the formulation of demands to the final settlement of disputes. This improved condition is due to many causes. Christian labor unions found that they could retain their membership only by defending the workers' interests as energetically as did the other unions—a situation which has caused many employers to complain that the Christian unions have become "at least as bad" as the socialists. Community of interests has enforced the same attitude with regard to all practical questions; the growing recognition of the unions by employers and the state has enormously extended the field of actual immediate responsibility on practical issues and accordingly narrowed the field of doctrinaire controversy on metaphysical problems, disagreement being limited to ultimate aims and doctrinal principles. Owing to the increased strength, responsibility and experience of the general unions, their post-war practise has become much more moderate, retaining little of the Marxian ideology which the Christian labor unions abhor. There has been since the war a decided turn to the left on the part of the political parties with which the Christian labor unions are associated; the German Catholic Center party for instance has during most of the time since 1918 been a parliamentary ally of the Social Democrats. Controversy between spokesmen of the two movements has accordingly become much more courteous and tolerant. Increasing homage is being paid on both sides to the "ideal principle of united unionism"; the Christian labor unions contend merely that this cannot be realized as long as the general unions fail to emancipate themselves still further from Marxian philosophy, while the general unions retort that they have no purpose other than to organize for the improvement of their condition all workers regardless of creed, and that therefore there is no bona fide reason for the separate organization of a Catholic minority.

In the meantime, while many of the leaders of the Christian labor unions admit that the decrease of ideological differences between both movements jeopardizes the existence of the

Christian labor unions' position, it has been stated by some of the socialist union leaders that their movement for industrial democracy must proceed on a more solid psychological and ethical foundation than that of the Marxian class struggle theory and that in this respect there is much to be learned from Christian doctrines.

CHRISTIAN SCIENCE. The Christian Science church is in reality a phase of a more general social movement which had its origin in the attempts to fuse two comparatively independent modern tendencies: the successful practise of, and increasing interest in, mental therapeutics; and theological liberalism based on antimaterialistic philosophies. Both these tendencies came to a sensational climax during the third quarter of the nineteenth century, and found their most significant social expressions in New England. In the rural regions mesmerism was prevalent and in the cities transcendentalism. When these two currents met they produced a new religious movement based on spiritual healing and antimaterialistic theology, which are dominant characteristics not only of Christian Science but of the kindred religious movements of New Thought, Spiritualism, Unity, Jewish Science, and to a certain extent of Vedanta, Theosophy and the Emmanuel movement.

The term "Christian Science" was first used casually by P. P. Quimby, a doctor and mesmerist in Portland, Maine. One of his most enthusiastic students and patients, Mary Baker Glover Patterson, later known as Mary Baker Eddy (*g.v.*), helped him systematize his ideas

and after his death continued to champion and develop them. The date usually given for her discovery of Christian Science is 1866, when she felt herself divinely restored after a severe fall on the ice. Thenceforth she worked assiduously on the so-called Quimby manuscripts until in 1875 she published the first edition of her famous *Science and Health*, to which she later added a *Key to the Scriptures*. After years of discouraging experimentation as author and teacher she made two moves which eventually transformed her individual practise into a world wide religion. In 1879 she organized her students at Lynn, Massachusetts, into the first "Church of Christ (Scientist)"; and three years later, in Boston, she established in addition to a church the Massachusetts Metaphysical College. From the latter institution practitioners were sent into all parts of the country, equipped with the Christian Science degree authorizing them to practise healing and to teach the "divine metaphysics." These disciples soon brought undreamed wealth and power to Mrs. Eddy and fame to her book.

The initial impetus of the Christian Science movement is accounted for not so much by Mrs. Eddy's personal accomplishments as teacher (certainly not as healer), nor even by the local prestige of her group in Boston, but rather by the practical successes of the pioneer practitioners in the Middle West. In almost all cases these were women, and achieved their most significant results among middle class women in the larger cities. Hundreds of testimonials of remarkable cures were forwarded to the leaders in Boston and published in the *Christian Science Journal* for the benefit of its widening circle of readers. In addition to the Sunday reading services midweek testimonial gatherings were organized and proved another source of enthusiasm for the practical results achieved.

The movement spread rapidly not only in the United States but in the British Empire, notably in the dominions, and in Germany. Its most remarkable recent advances have been made in California and Florida. With only a few significant exceptions the movement has found its stronghold in those classes and social groups where neurasthenic disorders are prevalent and where the accompanying intellectual environment is characterized by metaphysical speculations and pseudo-scientific theologies. Christian Science has a double appeal, its practical success as a therapeutic cult and its simple yet "scientific" theology. Although in its denial of the reality

of both matter and individual "mortal" mind it bears a superficial resemblance to absolute idealism, it is much closer in theory to the Hindu philosophies of disillusionment. There is little evidence that it has been directly influenced to any great extent either by modern philosophical idealism or by modern science. Its chief intellectual concern has been the exposition and re-interpretation of the Bible. Its theology is based on the idea of the "Father-Mother" God, the only reality, as impersonal, universal, infinite Principle, Mind or Good. Endowed with perfect love He manifests His spiritual power against the world of error, illusion or "mortal belief" by conquering sin, disease and death: both through Christ, who "demonstrated" man's "at-one-ment" with God, and through *Science and Health*, His modern revealed word.

At first the movement was attacked by the defenders of the more conventional Christian theology and, more seriously, by the medical profession. In almost every state attempts were made to prevent the professional practitioners from healing, by making a medical degree legally necessary for any kind of healing. The first attempts of this sort were made during the nineties (e.g. in New York, Massachusetts, Michigan, Oregon), while in England a similar move was made in 1906. But practically all of them failed, since the courts conceded the right of an individual to resort to any kind of healing he wished, and in the United States refused to interpret this issue as falling under the police power of the state.

More recently, various factors have contributed to greater tolerance. In the first place, Christian Scientists have adopted more reasonable tactics and the movement as a whole has been raised to a higher intellectual level. The physical fear of "malicious animal magnetism" which dominated so much of Mrs. Eddy's later career, and kindred ideas taken over from the mesmeristic background, have lost most of their force and have been assimilated to the metaphysics of "mortal mind." In 1901 Mrs. Eddy permitted her students to be vaccinated and enjoined them to obey all quarantine laws and not to treat contagious diseases. Since 1902, when she abandoned "metaphysical" obstetrics, there has been a general tendency among Christian Science practitioners to refuse surgical cases. A second factor is the great progress made in recent years by the science of psycho-therapeutics and its admission of many results of mental treatment which were formerly regarded as in-

credible or miraculous. At the same time, however, the practical vindication of mental healing by medical science has tended to undermine the theoretical interpretation of "spiritual or divine" healing required by Christian Science theology. A third factor is that other religious denominations, warned by the success of Christian Science, have given official encouragement to faith healing, prayer healing and other traditional practises which had fallen into disfavor under the reign of mechanistic psychology and metaphysics. Finally, the spread of other cults, especially of oriental, non-Christian ideas, has brought many new rivals and more sophisticated traditions into the field which formerly demanded an avowedly Christian theology.

Although healing has been the distinguishing characteristic of its practise, Christian Science has expended much energy also upon combating the more subtle manifestations of "error." It has sought to banish fear in its many forms and has preached optimism in the face of disasters, wars, depressions, poverty and social evils. As a result it has practically never engaged in movements of reform, in "social gospels" nor in the usual forms of philanthropy and church benevolence, except in the negative sense of denying the reality of evils. The most significant deviation from this policy was the Christian Science war work, which supported among the soldiers about two hundred "workers" and over a hundred "welfare rooms" and served not merely to distribute Christian Science literature but also to provide physical and mental comforts for the soldiers. Another deviation was the giving of considerable sums in recent years to sufferers from floods and earthquakes. As a church Christian Science has no political or social platform except in so far as it explicitly demands obedience to law, honesty in business and, in general, "the sweet amenities of Love, in rebuking sin, in true brotherliness, charitableness and forgiveness." The interest which many Christian Scientists display both personally and collectively in material comforts is explained on the ground that these external symbols, in a world of illusion, demonstrate, as well as stimulate, their love for harmony and beauty in that real world of infinite intelligence or love which constitutes the Divine Mind.

The highly centralized administration of the church is a masterpiece of Mrs. Eddy's genius. All who wish to practise or teach Christian Science must be members of the Mother Church. This is governed by a Board of Direc-

tors; the original directors, five practical men of affairs, were appointed by Mrs. Eddy and given the authority to choose their successors. The Board of Directors must govern the church according to the by-laws laid down by Mrs. Eddy in the *Church Manual*. It exercises absolute control over the membership of the Mother Church and final jurisdiction over the local membership and government of each of the various branch churches. According to the United States census of 1926 the Mother Church had 149,957 members, of whom 87,940 belonged also to branch churches; while the membership of the 1913 branch churches was 140,081, of whom 52,141 were not affiliated with the Mother Church. Out of the total membership of 202,098 about 9000 are authorized practitioners or nurses. More recent (1930) figures, published in the *Christian Science Journal*, give the number of Christian Science churches in the world as about 2400, of which about 2000 are in the United States and 200 in Great Britain. The male membership constitutes 32.5 percent of the total, and the urban about 94 percent. The *Christian Science Monitor*, a non-partisan daily newspaper published by the church, has a circulation of about 135,000. The most important of the other church agencies are: the Christian Science Publishing Society, governed by a separate Board of Trustees but in reality controlled by the Board of Directors; the Publication Committee, which conducts a vigorous campaign against "obnoxious books"; the Board of Education, which examines teachers, awards their degrees and gives free public lectures (about 3500 annually); the Benevolent Association, which conducts two "sanatoriums," one at Chestnut Hill, Massachusetts, and one in San Francisco; and Sunday Schools and reading rooms, which are found in almost every Christian Science society or church.

On the whole, the Board of Directors has maintained its power very shrewdly. Several law suits have tested its powers, especially with respect to the trustees of the Publication Society and over the trust fund trustees named in Mrs. Eddy's will. Several women have aspired to be Mrs. Eddy's successors but the Board of Directors has succeeded in asserting its complete authority over them. Only two movements have proved menacing. Mrs. Augusta Stetson, a devoted disciple of Mrs. Eddy, established a strong Christian Science organization in New York, which by threatening to eclipse the Mother Church in Boston aroused the jealousy of its

founder. By exalting Mrs. Eddy as "Mother Mary" to equality with Christ, a move which Mrs. Eddy herself publicly repudiated, and by exploiting her personal prestige as an intimate of Mrs. Eddy, Mrs. Stetson incurred the hostility of the Board of Directors as well as of Mrs. Eddy and was excommunicated in 1909. But she had an influential and loyal following in New York, which continued to proclaim her doctrines, such as the spiritual conquest over birth and death and the purely spiritual government of the church. After her death in 1928 her followers asserted their confidence in her, as well as Mrs. Eddy's, imminent reappearance and immortality demonstration.

A second serious dissension began in the Third Church of London, where Mrs. Annie C. Bill resigned after she had come under the influence of Frederick L. Rawson's doctrines. Appealing to the *Manual* and defying the authority of the Board of Directors after Mrs. Eddy's death, she insisted on a single successor to Mrs. Eddy and organized a "Central Assembly" with herself as "pastor emeritus." She was sued for adopting the "authorized" titles of the Mother Church, and after losing her case in the courts with a few followers she changed the organization to the Parent Church of the New Scientific Generation. In 1924 John V. Dittmore, who was one of the original five directors of the Mother Church and who had been ousted by his fellow directors, joined the movement and carried a considerable personal following with him. American headquarters were established at Washington, D. C., and the name was changed to the Christian Science Parent Church, The Church of the Transforming Covenant. In 1930 all connection with Christian Science was abandoned and the name was changed to The Church of the Universal Design. There are now about 80 branches and 1200 members in this church. In doctrine the Parent Church is distinctive in emphasizing a spiritualized version of evolution, in sponsoring the Anglo-Israel doctrine and in preaching medical cooperation. Although it is small numerically it is significant as another evidence of the difficulties encountered by the Board of Directors in keeping the church under its control.

CHRISTIAN SOCIALISM

GREAT BRITAIN. Christian Socialism was the phrase chosen by a small band of clerical and lay members of the Church of England in the middle of the nineteenth century to express their deep conviction that the economic development and the social relations of the community could prove satisfactory only if they were consciously brought into obedience to the spirit of Christ and His purpose for mankind. They found the church, to which they were passionately attached, accepting and even commending the views of philosophers, politicians and economists whose knowledge of public questions it reckoned superior to its own. Those views justified, on grounds claiming to be scientific, the abandonment of the vastly expanding industrial system to the virtually unregulated dominion of the profit seeker, the glorification of competition regardless of its effects and the discouragement of all efforts at combination among the laboring classes, either to alleviate the conditions of their employment or to seek a livelihood outside the wage system. The Christian Socialists challenged both the validity of this teaching and the right of the church to identify itself therewith. The resistance of the masses to the workings of the industrial system was, they claimed, not merely justifiable but actually animated by contrasting ideals of cooperation and service which were in harmony with the spirit of Christianity. The Christian Socialists banded themselves together therefore to proclaim the supremacy of Christian values over purely secular considerations, to expound the traditions and implications of Christianity in this light, to enlist the sympathy of the public for the efforts made by the workers to improve their conditions and transform their status, and to initiate practical experiments in working class education and cooperation of every kind.

The Christian Socialists "owed their inspiration to Carlyle and their opportunity to the

Chartists," says Canon Raven in his authoritative history of the movement. 'The socialism which was crystallizing into a scientific form in the *Communist Manifesto* of Marx and Engels, though much of it had been formulated in England, influenced them scarcely at all. Some had been affected by the protests of Southey and Coleridge against the laissez faire doctrines of the Manchester school and the utilitarianism of Bentham, others by the French experiments in industrial cooperation which grew out of the writings of the Fourierists. This latter influence was conspicuous in the case of the young barrister John Malcolm Ludlow who was the true founder of the movement. Educated in Paris he returned there to witness the development of affairs after the Revolution of 1848, and wrote his reflections thereon in a letter to his friend Frederick Denison Maurice; this letter, Maurice testified, exercised "a very powerful effect" upon his thoughts, and led to a series of talks between the two in which were developed the main ideas that formed the foundation of Christian Socialism.

There broke in upon these colloquies a new social situation and a dynamic personality. News of the Monster Petition meeting organized by the Chartists for April 10, 1848, brought Charles Kingsley to London. And in the company of Ludlow he witnessed the fiasco in which the meeting issued. To both men the situation presented itself as a challenge and an opportunity for the church. That for which the workers were groping unsuccessfully, religion must come forward to supply. They sat up through the night drafting placards which were posted up next day upon the walls of London, proclaiming to the "Workmen of England" that "the Almighty God, and Jesus Christ, the poor Man who died for poor men, will bring freedom for you, though all the Mammonites on earth were against you."

Christian Socialism thus emerged with a significant gesture on the morrow of a democratic defeat. It began its work as a propagandist force through periodicals (*Politics for the People* in 1848 and the later *Journal of Association*, 1852-54), pamphlets (notably *Tracts on Christian Socialism* in 1850) and novels (Kingsley's *Alton Locke*, 1850, and *Yeast*, 1851). It entered the field of practical experiment as the "Council for Promoting Working Men's Associations" in 1850; it achieved an important legal reform in the Industrial and Provident Societies Act of 1852; and set the coping stone on that education

of the workers which it had undertaken from the first by the foundation of the Working Men's College in 1854. The work of these six years was carried through by a group of men, mostly laymen from the professional classes, who faced with wonderful confidence and perseverance the ridicule of the respectable and the suspicion of the workers in whose cause they sacrificed their time and sometimes, as in the case of E. V. Neale, their fortune. Their loyalty to their leader Maurice remained unshaken. His leadership was founded, indeed, on a real spiritual genius, distilling its influence most characteristically through the group's weekly Bible reading which was "the sacrament of their unity, the means whereby they received their inspiration."

The experiments in producers' cooperation into which the Christian Socialists put their principal expenditure of effort and funds ultimately failed. The dishonesty of a few, the insubordination of others, helped to wreck enterprises which were struggling with insufficient resources, moral and practical, in an atmosphere hostile to them. Nothing in the development of industrialism had prepared the workers for the task to which the associations called them. But to speak of Christian Socialism as a failure is to misconstrue the significance of the movement. Two things it conspicuously achieved: association of single minded men among the middle classes with the fate and the aspirations of the working class, a tradition carried on later by the positivists, the Fabians and the Guild Socialists, and the rescue of religion from the social apostasy and sycophancy into which it had sunk.

The "socialism" of Maurice and his group was neither collectivist in outlook nor bound up with any political theory of a revolutionary working class movement. When the challenge of Christianity to the dominant economic forces of the day was formulated afresh a quarter of a century later, while its note was distinctly more revolutionary than that struck by Maurice and his group, its independence of secular partisanisms was equally unmistakable. This challenge proceeded from a new quarter—the Anglo-Catholic movement in the London slums. Stewart Headlam, while he readily acknowledged the inspiration of Maurice, founded in 1877 the Guild of Saint Matthew in Bethnal Green upon his own interpretation of Catholic theology and the social significance of the sacraments. He made explicit the Tractarian protest against plutocracy and materialism which, because it was delivered as part of an attack upon "liberalism,"

had generally been interpreted as merely reactionary. The Guild of Saint Matthew thus "achieved the impossible by being at once Puseyite and Maurician," but its ecclesiastical "extremism," its frank sympathy with the new unionism and socialism of the nineties and its audacious anti-Puritanism necessarily limited the scope of its appeal. A less dogmatic and more cautious group gathered round the great figures of Scott-Holland and Charles Gore in the Christian Social Union (founded 1889), devoting itself to the study of social problems in the light of Christian principles and to the advocacy of practical measures of reform. Parallel bodies began to form in the nonconformist communities under the name of Social Service Unions, and in 1910 these drew together in regular interdenominational conferences, evolving an outlook increasingly critical of the economic order. Included amongst these was the (Roman) Catholic Social Guild founded in 1909, a live body which derived its inspiration from the scholastic traditions in restraint of usury and economic injustice and from the encyclical *Rerum novarum* of Pope Leo XIII. Outside stood the Church Socialist League, formed in 1906 largely under Anglo-Catholic influences, carrying on a vigorous propaganda in avowed sympathy with, although independent of, the new widely expanding socialist movement. A smaller interdenominational Society of Socialist Christians replaced this in 1924.

The war, by calling attention in so many ways to new problems of conscience and to the defects of the social system and by dispersing the fog of "progressive" complacency and revealing a new consciousness of crisis, opened a fresh chapter in the history of the attitude of the churches to social issues. The feeling began to spread that secular civilization was at the end of its resources, that religion had, or must discover, something distinctive to say upon political and economic problems and that it must do more than merely approve or support policies evolved by others.

The influence of Christian Socialism has extended far beyond these groups, not only in England but in continental European countries and in the United States, to a movement which in its manifest activities and intellectual expression is most widely known as Social Christianity.

MAURICE B. RECKITT

appear until the late eighties of the last century. The semi-utopian communities of the forties and fifties were, it is true, an American manifestation of those Fourieristic influences which had affected the first English Christian Socialist leaders. The founder of one of these communities, Adin Ballou, had in fact described his scheme as Practical Christian Socialism (Hopedale 1854). These early groups had attempted also to make some connections with the struggling labor movement of the period. It was not, however, until the industrial and social upheaval of the eighties and the establishment of the Knights of Labor that socially minded clergymen attempted to break down the barriers which had grown up between labor and the church under middle class influences.

The first expressions of this new social consciousness, in the writings of Josiah Strong and Washington Gladden, in the formation of the Christian Labor Union (1872) and of the more influential Church Association for the Advancement of the Interests of Labor (Cail) in 1887, were concerned more with bridging this chasm than with any thoroughgoing theory of social and economic transformation. The more radical approach was probably first taken by the Reverend W. D. P. Bliss, who had been a member of the Knights of Labor, who in 1889 formed the Society of Christian Socialists in Boston and who, thereafter, in his magazine, the *Dawn*, in pamphlets and in his country wide lecture tours attempted to spread the doctrine of Christian Socialism. This doctrine was largely that of the English movement. The Christian Social Union founded in 1891 was affiliated with the English Christian Social Union. In the nineties many small and obscure groups, denominational and interdenominational, sprang up. At the same time individual clergymen, like the Reverend George D. Herron, embarked on a series of activities which led to their eventual affiliation with the non-religious socialist movement. The interdenominational Christian Social Fellowship, formed in 1906, and the Church Socialist League (1911-19) not only formed the nucleus for later church groups but furnished many of the leaders for later liberal, labor and socialist organizations. The writings of Walter Rauschenbush, especially his *Christianity and the Social Crisis* (New York 1907), clarified and gave spiritual impetus to the American Christian Socialist attitude. By this time, however, the growing movement within the churches had become less definitely

UNITED STATES. Christian Socialism as a definite movement in the United States did not

socialistic and was concerned primarily with the application of the social gospel to immediate industrial and social problems.

At the present time the movement for Social Christianity, as led by Harry F. Ward, Bishop Francis J. McConnell, John Haynes Holmes and others, shows the definite influence of the earlier protagonists of Christian Socialism.

CHRISTIANITY. The primitive teaching of Christianity set before mankind the ideal of a life based simply and solely on the love of God and man. One love implied the other, for if a man loved not his brother, whom he had seen, how could he love God, whom he had not seen? And if he did not love and trust God as a father how could he understand that all men were God's sons and therefore his own brothers? How could he avoid occupying himself with the things of the world which set man against man? In Christian love, mankind became as one family in which the needs of any one are the concern of all, in which none is before or after the other, none is greater or less than another, and all are protected by a Father so omnipresent that not a sparrow falls to the ground unheeded by Him. Man, therefore, should not be anxious about the morrow, heaping up riches when he cannot tell who will gather them, but should meet the difficulties of the day, raising the ass or the ox from the pit even on the Sabbath, minis-

tering to the needy and serving the Lord in cheerful contentment with his lot. Such a life may be achieved by every man in ordinary society, for it depends primarily on his own personal love and trust. Although there may be those who will injure and despitefully use him, he will reply to injury with beneficence, to evil with good. It was understood even by the Gentiles that they should love their friends; but the Christian loves his enemies as well and turns the other cheek to the smiter. He must not even vindicate his rights; if a man takes his cloak, he must let that man have his coat also, for the meek shall inherit the earth. He must assert not himself but his Christianity. No mortification of the flesh is enjoined for its own sake - marriage and the natural affections are assumed, and the sex teaching is simple and wholesome. It is only if the family tie obstructs a Christian call that it is wrong. When the call comes to any man he must leave all and follow it. Asceticism is no end in itself; but all desires of the body and all claims of personal love are swept aside if at any point they interfere with Christian duty.

While the Christian life is open to anyone, in any society, however full of oppression and wickedness, its natural fulfillment and perfect expression are in a brotherhood of the believers. This brotherhood will have no worldly aims. It will not seek to dominate either the world of nature or the world of man, although it will seek to draw all men into it by spreading the light. Its aim is to live by the law of love. The physical necessities of life it will secure by honest labor and by sharing all things in common, and even its apostles will work with their hands at tent making, or whatever it may be, so far as the first duties of the Christian mission allow them. Work is a duty; if a man does not work he shall not eat. On the other hand, there is to be no self-enrichment. It is hard for a rich man to enter the kingdom of heaven, and all that a man has, beyond his personal necessities, he should give to the poor, or rather bring into the common stock. At the same time, outside the community the laws of civil society and the authority of the rulers are accepted. To Caesar are to be rendered the things that are Caesar's. The powers that be are ordained of God. Christ's kingdom is not of this world.

Such communities sprang into being in many places during the apostolic age. Their simple communism was not, as in the monastery of a later age, a communism of production. The ordinary Christian had his employment in or-

dinary life, but he brought all his superfluities into the common stock. But though there was no collective organization of production, there soon came to be organization of church government, including the administration of the common funds. The communistic rule might be very strict, as the story of Ananias and Sapphira shows (for while the punishment might be justified on the ground of their deceit, the point of the tale is that no partial sacrifice of wealth avails). A more lenient view, however, goes back to very early times; and in any case this simple communism could hardly survive the growth of the Christian communities. Broadly speaking, communism as a system which, without excluding all personal possessions, makes the common wealth dominant, works well under one of three conditions. First, it operates in every well ordered family where, whatever personal possessions are recognized, the fundamentals of wealth are shared alike, and where in case of shortage the weak and helpless are served first. Secondly, it works well in very primitive communities where none has risen above the rest, all are concerned with day to day needs, all are born and bred in one tradition and in fact form a kind of enlarged family. Thirdly, it functions among men united by a common purpose—even a common need, as in the case of a shipwrecked crew—to which everything personal gives way; such a community was the early Christian church, and such were the best of the monastic brotherhoods. As long as the common dominates the personal, group communism holds its own. Under the first condition mentioned, the common dominates through the strongest natural affections. Under the second, personal initiative is hamstrung by the absence of opportunity for self-advancement. Under the third, even the strongest individuality may be held in restraint by the universal conviction of the common purpose; but as soon as the insincere and half converted come in the tie is dissolved. Communism, although preserved in the monastery, is for the laity reduced first to the duty of applying superfluities to the common need, and then to the obligations of charity. Finally the spirit of charity itself frequently perishes in its "organization."

In this connection, however, it must be acknowledged that obligations to the needy and a certain vaguely defined trusteeship in the possession of wealth have been continually maintained by Christianity in most if not in all of its forms, and that sociologically the institu-

tion of Christian ministers, lay officials and establishments for the relief of indigence and suffering are regular features of any Christian society. Exactly how Christianity compares in this respect with other religions, or with pagan or secular states, it would be difficult to say without an elaborate and difficult examination. Material beneficence is one of the oldest and most universal of the virtues. Islam and Judaism are notable for their insistence on works of mercy. Christendom is remarkable for the universality of its philanthropy, for the great variety of its efforts which have organized distinct forms of relief for so many different kinds of suffering and for the exceptional self-sacrifice of doctors, nurses and ministers of religion.

While simple communism was bound to melt away with the expansion of Christianity, the question of the relation of the church to civil society became increasingly important. From the first it was to recognize the powers that be, but at the same time "saving always the duties of a Christian" was an understood condition. How was it to comport itself in regard to the laws of the land when opposed to Christian duty or the Christian spirit? Confronted with a pagan government there were points on which the Christian clearly could not conform, and these came to the front in every persecution. And there were deeper issues by no means settled when Christianity became a state religion and the whole empire in name a Christian brotherhood. How were the law of the state and the law of love to be reconciled? The state recognized war, had courts for the redress of private wrongs and the punishment of criminals, used the oath—and in those days torture as well—in the legal procedure, guarded private property and allowed the indefinite accumulation of wealth together with its inheritance and bequest, sanctioned slavery and the sale of men, women and children, allowed the exposure of infants and recognized divorce. Some of these things were, as all would now admit, abuses; others, especially the institution of courts of law and the recognition of private property, appear integral to organized society. War society hopes to abolish, but so far military defense has appeared a necessity of state organization. What was Christian teaching to do in the matter? Nominally it had conquered the western world. What was the real relation to be? Was it to absorb the world or to be absorbed by the world as conquerors so often are by the conquered? Or was it after all to stand

aloof from the world and establish a dual law—worldly and other-worldly—for mankind?

In order to understand the course of events we must first appreciate the Christian attitude as it came to define itself. Primarily the Christian life was inward. It was something that each could attain for himself and was independent of outward circumstances. Slave and emperor could be equal as Christians, just as they had been equal as stoics. Material possessions were indifferent, except indeed that their increase added to the difficulty of remaining a good Christian. It must in truth be added that even intellect was indifferent, for out of the mouths of babes and sucklings was ordained praise. Neither philosophy nor science, neither art nor literature, was essential. The Christian teaching might broaden its outlook, but as such it had no essential concern with the Hellenic conception of a many sided development of personality or with the modern ambition to read the secrets of the universe and to acquire thereby a control of the conditions of human life and development. Nor was it concerned with the humanitarian view that institutions and even moral laws involving great suffering to men and women must be wrong. The law of God was in essentials known and must be accepted come what might. Man was made for no other happiness here on earth but the happiness of accepting that law and of taking with contentment that lot which it would allow him. Thus it would be quite unhistorical to criticize the work of the churches as if they had meant to recreate society on the lines of modern humanitarianism. Modern Christians may, and many do, regard this humanitarianism as the natural development of Christ's teaching, but in the early formative days no such development was in sight. Christianity had primarily to maintain itself in a society which at first was hostile and, even after Constantine, contained all sorts and conditions of men—unbelievers, nominal Christians, Jews, infidels and, above all, heretics. The ideals of the simple brotherhood of all true Christians were inapplicable. The original teaching, as well as the wisdom of Christian leaders, recognized the state as a necessity. The problem as it appeared was to find some reconciliation on the points at which state law and Christian law were in definite conflict whether in letter or in spirit.

In form—and form affected substance—the solution was found in a slightly modified acceptance of the stoic conception of the *jus naturae* and the Golden Age. By nature, the

stoics taught, man was free and equal and there had been a Golden Age in which man had actually so lived. From this state he had, however, fallen off, and the *jus gentium*—the legal principles common to all nations—recognized subjection and inequality, while the positive civil law of any particular state, and of course of the Roman Empire, imposed its own special obligations on its citizens. Where the civil law conflicted with natural law it was in principle void; but the stoics refrained from the effort to abolish it, primarily because they held that the wise man was superior to all institutions, since these were but external things, while he could always regulate his own conduct by the light of reason. But as jurists they did seek to bring the civil law as near to the law of nature as might be, short of revolution.

The Christian fathers took over these conceptions, adding an explanation that the falling away from the state of nature, or innocence, was due to sin and that the state was the divinely appointed remedy for sin. Nature was good, for it was what God made. Actual society was defective, for it was the outcome of man's sin. But law and the state were good, as it were at one remove, because they were God's appointed remedy for sin. Because of their origin they involved hardships, like slavery, and allowed things unfitted for a Christian brotherhood, like the accumulation of riches. But the true Christian was above or indifferent to circumstances. He might be loyal and trustworthy as a slave. He might use his riches for the glory of God or for the benefit of the poor. These considerations together governed the attitude of the church, and it was left to the enthusiasm of the sects of the future to strive after fuller Christian ethics. In the meantime state law was to be respected, with two exceptions: if it was in clear and literal conflict with Christian teaching, it was to be abolished; if it was contrary to the spirit, it was to be softened and amended.

Among the points of conflict slavery would seem to us perhaps the most definite. Yet neither stoicism nor the church sought its abolition, although its justice had been challenged by thinkers as early as the fourth century B.C. Here the doctrine of the indifference of circumstances was as fatal to the church as it had been to the stoics. Slaves must obey their masters, and masters must be kind and just to their slaves. The slavery of the later republic and early empire had been intolerably harsh and cruel,

but for two centuries and more the stoic jurists had been at work upon it, and the worst features had been suppressed. Morally the stoics recognized the equality of slave and freeman and the church similarly maintained that slave and master as Christians stood on the same footing, and it accepted slaves, at least on emancipation, for the ministry. As to legal rights the canon law imposed its own penalties on maltreatment of slaves. What was most important was that the canon law gave sacramental sanction to slave marriages, which originally had no recognition in law. Some slight advances toward such recognition had indeed been made under the pagan empire, but it was by a law of Constantine that the separation of slave families was forbidden. The consent of the master was at first required to validate a marriage of slaves, but this condition was eventually abolished by Pope Hadrian IV. Marriages of slaves and free were allowed under Justinian. In the view of the church the consent of the parties was the sole prerequisite of marriage, and on the whole the church stood by its principle in relation to the slave and to later feudal rights. Yet the right of feudal superiors was long to survive, and even in the sixteenth century the Council of Trent found that it was too often the custom for secular lords to compel men and women to marry against their will, a practice which they anathematized on the grounds that it was *maxime nefarium matrimonii libertatem violare*.

These were the most important contributions to the rights of the slave made by the mediaeval church, which for its part did not hesitate to hold serfs and is indeed charged with more than average tenacity in keeping its own. Christianity did not abolish slavery. But there were two ways in which the church's action made for the gradual extinction of the institution. First, it opposed the enslavement of fellow Christians, whether as war captives or through the slave trade. For example, the traffic in slaves which went through Bristol to Ireland was suppressed in the eleventh century by Wulfstan, bishop of Worcester, and although by a regrettable inconsistency the church allowed a man to "commend" himself, his wife and children to an abbey, its influence helped to secure the limitation of debt slavery to the period necessary for redeeming the debt. These limitations went a long way in reducing the supply of slaves. Secondly, the church always encouraged emancipation as a deed of charity. It is clear, therefore, that the influence of the church must be

reckoned as an important factor in the extinction of the slave class, which, so far as true chattel slaves are concerned, was nearly complete in western Europe by the end of the twelfth century.

The enslavement of non-Christians was another matter. All through the Middle Ages a regular trade in slaves was maintained by the Genoese and Venetian merchants in the Levant. To deal in Christians was prohibited, but did adherents of the Greek church count as Christians? Authority was inclined to wink when in practise the negative view obtained. In any case, there is evidence that there were slaves in considerable numbers in Genoa and Venice (where in 1368 they were numerous enough to constitute a public danger); and although they were rarer inland, there were 339 sales of slaves (mostly female) in Florence between 1366 and 1397. The matter became much more serious when explorers began to open out new worlds, where backward peoples were at the mercy of European arms and organization. To the church the prospect of converting the natives was held out as a bait, and this hope was the explicit ground of the bull by which Pope Nicholas V in 1454 sanctioned the importation of Negro slaves into Portugal. In full consistency with principle the enslavement of Negro neophytes was condemned by Pope Pius II in 1462. Yet presently doubts arose on the whole question. Columbus' despatch to Spain of five hundred Indians as slaves was the occasion of a juristic dispute, and the Indians were eventually sent back by Queen Isabella. When the Negro traffic to America began, the popes, it is but fair to say, made successive efforts to check it. Although no one stopped Sir John Hawkins, who first brought Negro slaves to North America and believed that he was acting as a good Christian, it was a Christian sect, the Quakers, that led the protest against this second and very detestable slavery. Churchmen, Methodists and rationalists co-operated in the eighteenth century movement for the suppression of the slave trade and in the nineteenth century extension of the struggle to the suppression of slavery. It would be unreasonable to attribute the success to the Christian elements alone. It was perhaps the first, but by no means the last, case of cooperation between an enlarged and enlightened Christian conscience and the secular humanitarianism which was beginning to inform ethics and law.

It must be added that the struggle for elementary rights for the weaker peoples is by no

means over, that forced labor may come perilously near to slavery, that social exclusiveness and the closing of avenues to skilled employment may make the Christian native an outcast, and that in this struggle the Christian missionaries are the force on which we have now mainly to rely for the education of public opinion on this important and dangerous aspect of the "expansion of Europe."

Warfare stood in even sharper contrast to Christian teaching than slavery, and it was in this conflict that the failure of the church was most conspicuous. The early Christians held military service unlawful, but in spite of many prominent supporters the rule was soon relaxed, and a full blooded defense of "just wars," i.e. wars for the redress of wrongs or for self-defense, was but feebly qualified by censure of malice, cruelty, vengeance and the lust of dominion. Ambrose—although he could compel a king to do penance for a massacre—denounced the principle of non-resistance and declared that he who refused to defend a friend was as bad as the aggressor. In the Canon de Treuga the church made an effort to mitigate private wars, but throughout history the churches have given moral support to official wars. It was left to the sects that went back to primitive teaching—the Anabaptists and above all the Quakers—to lead an opposition to war as such and to wrestle as best they might with the resulting problem of internal security.

The methods of war were indeed so far alleviated that the killing of non-combatants, the enslavement of Christians and the refusal of quarter were forbidden, although in justifying ransom the canon law, as stated by Gratian, seems still to imply that in principle the life of the conquered is forfeit. Unfortunately these prohibitions were difficult to enforce, and the wars of Christendom hold their own for horror when matched with those of the heathen, the wars of religion being perhaps the worst of all. Possibly the best defense of Christianity is that the secular spirit, working since the days of Grotius through international law, has as yet little to show, and in the World War even the distinction between combatant and non-combatant began to crack. The *via media* between the piety of non-resistance and the crude realities of oppression and aggression has not been discovered for nineteen centuries.

What now of the element of force within the life of the state—the enforcement of law, the procedure of courts and the punishment of

crime? As a persecuted sect the Christian church had its own legal system, resting on penance and excommunication. As an official religion it at once recognized the lawfulness of public justice. Retaliation by the individual is wrong, but retaliatory punishment may be lawfully inflicted by the judge. For he gives not evil for evil, but justice for injustice, which, says Augustine, is good for evil. An ingenious turn, although not as honest as Confucius' denial that justice to the offender can be reconciled with Lao Tzu's doctrine of good for evil. But consistent or not, this decision of the church was socially necessary. When, however, we find excuse offered for the faithful who *ex officio* either exercised torture or passed a capital sentence, we are on different ground. The church did not in fact use its opportunity for abolishing the use of torture, which disgraced the Roman law. About capital punishment it certainly had its doubts. It became the rule that ecclesiastics could not enforce it, and clerks omit the words in the sentence, leaving the criminal "in mercy." There was even in the Middle Ages, particularly in the tenth and eleventh centuries, a definite revulsion against capital punishment, and it was, for example, actually abolished in England by William the Conqueror. The substitutes of blinding and castration were even worse than the original, however, and by the thirteenth century, without legislation, death resumed its place as the penalty for felony. Centuries earlier the whole system of Roman law had crumbled in the West under the barbarian invasions, which had reintroduced the feud, and in the courts the oaths of purgation and the ordeal. The church did its best to resist this rebarbarization, but had eventually to make terms with it. Not without controversy it gave its sanction to the ordeal; and Charlemagne ordered all men to believe the judgment of God without any doubt. In the meantime, however, the church was feeling its way back to rational justice through the courts of inquest into morals held by the bishops. They were ably seconded by the growing power of the king's court. And while both bishop's and king's courts at first allowed the oath of purgation or the ordeal by combat or by magical procedure, these methods were suppressed under Innocent III, and ordeals in particular were condemned by the Lateran Council of 1215. It took time to consolidate the victory. The ordeal by combat, forbidden in France by Saint Louis in 1260, lingered in England through the thirteenth century, when champions for hire still offered

themselves; and some remnants of the old law still survived in the early nineteenth century.

On the whole, however, the principle of impartial justice, based on evidence and supervising public safety, prevailed, and the church certainly played its part along with the state in securing this first principle of modern civilization. On the other hand such methods of barbarism as the use of torture in procedure and extreme severity of punishment survived; the latter tended rather to increase than to diminish, and with the exception of the temporary check on capital punishment does not seem to have been combated by the official churches, which indeed in their own dealings with their special enemies, the heretics, only led the way. The penal law of Europe was a disgrace against which there was no serious complaint until a protest was led by the Quakers and supported alike by the utilitarians and the Evangelicals in the eighteenth and nineteenth centuries. Here again "primitive" Christianity and ethical rationalism found themselves at one.

The primitive theory of communism continued to the Middle Ages as one of those principles of natural law which, owing to sin, had been set aside by civil law. Aquinas, however, does not allow that there is any true contradiction, but considers that natural law simply neglected to make any division and that the omission was supplied by civil law, and rightly, in his view, since private property tends to the avoidance of quarrels and to efficiency in production and administration. Aquinas in this connection is closer even than elsewhere to Aristotle, in whose antithesis—"private acquisition, common use"—he finds the solution. The Christian must use his property for the common benefit and, what is remarkable, in case of necessity the "natural law" of communism revives. To supply the actual and urgent necessities of life—e.g. to meet imminent danger—whether for self or for another, it is no crime to take another man's superfluities, whether openly or secretly. One may regard the Poor Rate (after all a compulsory levy on those who have for the benefit of those who have not) as a regularization of this principle, which otherwise might seem to smack rather of Robin Hood than of Augustine, and certainly goes far beyond the common exhortations to charity. At the same time, in returning to Aristotle Aquinas was preparing the way for the coming industrialism. For the appeal to production and efficiency is

distinctly secular in spirit, while the vindication of private ownership departs not only from communistic idealism but from the feudal order, in which the most important property was held on a basis of definite obligations in respect of it.

The methods of acquiring property were always a matter of concern to Christian ethics to the extent that they involved any form of exchange in which one man might get the better of another. To Christian ethics this was the sin of covetousness, and it was the universal opinion in the church that in buying and selling a man should ask and give the just price, and that in seeking payment he should demand what was necessary to support him rather than the most that he could get. Above all, lending should be a friendly act and should not be an occasion for usury, which always appeared to the legists, and particularly to the schoolmen under the influence of Aristotle, as a gross and palpable method of getting something for nothing. These rules of behavior bore a simple and intelligible relation to the rather primitive economy into which the world had relapsed after the luxuries of Roman civilization. The modern economist would probably be willing to admit that a man should give and take the just price if he only knew what the just price was. In a simple society it seems to be known. It is what always is, always has been and always will be given by men who know what they are about. It is in fine the customary price, and if a seller gets more than that it can only be either by deceiving the purchaser or by taking advantage of some special necessity. In other words it is a piece of individual wrongdoing, as the modern economist would very willingly admit. But as soon as markets begin to extend, as alternative sources of supply occur, and, finally, when competition sets in, customary standards lose their hold. The classical economy has built itself up around the conception that there is really no exchange value attached to a thing except that which can be arrived at by the higgling of the market in free and open competition. The difficulty is not unfelt by the exponents of the canon law and as the economic system develops they take account of the impersonal forces determining value, but without deserting the principle that it is illegitimate to make selfish profits at the expense of another. It must be borne in mind, however, that for them a just price and just remuneration is that which is suited to maintaining a producer in the state of life to which he is accustomed, without superfluities—a standard which it must be said seems

to accept and stereotype the class distinctions of the feudal world.

Lastly, with regard to usury, which has a long and rather tangled history, the canonists were right in condemning the man who takes advantage of the necessities of the peasant. But they misunderstood the nature of interest when they troubled themselves with distinctions between interest on money and rents on land, between recompense for risk or damage and bare payment for the use of money. For a long time they did not appreciate that the use of a loan was a valuable asset for which the borrower would be just as willing to pay as, say, for the tool which he had to buy outright in order to carry out his job. In large scale transactions of Jews and of great firms like the Fuggers, however, it became apparent that the big men who borrowed from them were not in a position to be put upon, but were acting with their eyes open on the well founded belief that they were getting full value for the interest which they undertook to pay. If the self-interest of important men was the main motive for the toleration of such transactions, there was a real distinction, at first no doubt more readily felt than accurately formulated, which eventually led to a very different view of interest. How far the prohibition of usury held back the development of industry and commerce is not very easy to say. Its most palpable effect was to concentrate finance in the hands of the Jews, who had no scruples about taking usury from Gentiles. But eventually the entire machinery of regulation proved ineffective to deal with the oncoming rush of the new industrial forces, before which the old rural economy and the guild monopolies went down, carrying bad things like serfdom and good things like neighborly dealing along with them in their ruin.

It has been a common opinion that the Protestant Reformation was responsible for the economic individualism which came to dominate the modern world, and which as a doctrine won its way to supremacy during the eighteenth and nineteenth centuries. But recent writers have shown this to be a mistake. Luther's attitude on questions of industrial regulation was, indeed, inconsistent and quite unsystematic. Calvin, however, not only took over the general conception of the duty of the church to regulate the economic order but carried it through with an efficiency and particularity which the mediaevalists might have envied. And it was the Elizabethan and Stuart legislation, notwithstanding its opposition to Calvinism, which was not only

insistent upon the authority of government but made the first effective attempts to adjust its regulations to the changing order of things. Calvin, however, and with him the forms of Protestantism, deriving and yet departing from his impulse, introduced (or at least gave real effect to) two new departures. They definitely recognized the legitimacy of interest under strict moral limitations, whereby the new capitalism achieved legitimacy and social respectability and, further, they gave to the industrial virtues of probity, industry and enterprise an acknowledged place in the moral order. Cutting off much of the gaiety of life they sought an outlet for human energy in cultivating the fruits of the earth for the benefit of man, conceiving success as a testimony to the glory of God and even as a proof of divine favor to the elect. The Puritan type, essentially serious and strenuous yet on principle repudiating asceticism and monasticism, living in the world, marrying and giving in marriage, needed a direction for its energies which was secular and yet honorable and pious. Wealth could be turned to the service of God and to the benefit of the poor, and in fine the doctrine that the meek should inherit the earth might take the form of a demonstration that the elect understood how to cultivate its fruits and to use them for the common advantage. The repudiation of luxury, wanton expenditure and idleness could take the form of the exaltation of thrift, strict application to business and austere self-control in the enjoyment of its fruits, which would after all only result in their continued multiplication.

These principles, in R. H. Tawney's view, held the field in England until the Restoration, after which they suffered from simultaneous assaults from more than one source. In the first place, there was a general reaction against severity of control, religious and even moral. In the second place, the monarchical and still more the ecclesiastical machinery for the control of industrial relations suffered in the Puritan estimation from the general unpopularity of church and king. But, in the third place, and what turned out most fundamental, the new commerce and particularly the new finance began to claim autonomy and evolved its own science of political arithmetic, which in the next century began to be known as political economy. The central idea which emerged in this study was that economic relations left to themselves regulated themselves. There was an underlying harmony of interests, a hidden hand, which

brought it about that intelligent but selfish men in their dealings with one another were forced by their mutual relations to give the best service to each other while merely seeking the best advantage for themselves. Regulation from above might have its exceptional uses, but too often it was inept and in the main only served to block the natural channels into which unimpeded self-interest would flow to the advancement of wealth and the greatest common sum of prosperity. Even the good intentions of government were by no means above suspicion. In England the aristocracy had obtained power and used it for its own advantage. In administration it was difficult enough to get bare honesty. No one would have dreamed of committing to the rudimentary civil service of the eighteenth and early nineteenth centuries the great complex of regulations which are efficiently worked at the present day. It was by no means certain that to tighten regulation would benefit the sufferers from the industrial changes, and many of the old controls were manifestly out of date.

It would be unfair to condemn the economic movement root and branch for its emancipation of industrial life from religious, legislative and administrative control. Men like Adam Smith were as humane and as much inspired by the conception of the common well being as any mediaeval canonist, but they believed that in what they called the system of natural liberty they had found the right way, and so far as they were condemning the governments and governmental methods of their experience who shall say that they were wrong? The real mischief was, as the Hammonds have shown, that in the critical early period of the agrarian and industrial revolutions the governing classes took from Adam Smith what suited them and quietly ignored what was inconvenient to them. Where it was a question of protecting the standard of the workers the doctrine of *laissez faire* seemed a heaven sent message. Where it was a question of enclosures there could be no objection at all to the use of the law. Freedom of contract and exchange was everything where the employer of labor required the unrestricted right of working women and children for the hours and under the conditions which suited him, but freedom of imports was all wrong when it would lower the price of agricultural products. The incidence of Christianity on the economic life seems to have been virtually in abeyance during the eighteenth century until the time of the Methodist and Evangelical revivals. These bore their legislative

fruit in the agitation for the factory acts and in the reform period were, so to say, incarnated in the great dominating personality of Lord Shaftesbury; while the Christian socialism, which began with Maurice and Kingsley and later in the century was carried forward by a small but well instructed and influential group of High Churchmen, has undoubtedly played its part in the reestablishment of moral ideas in industry. To such forces as these we may fairly attribute the contrast between the markedly anti-Christian attitude of continental socialism and the relatively friendly relations obtaining in British society. Once again we find the primitive elements in Christianity in cooperation with ethical rationalism.

In the law of the family Christian doctrines have been dominant since Constantine. Christian ethics, for reasons which have never been fully explored, have tended to concentrate on the sexual relation. The tendency does not originate with the Gospels, whose sex teaching is simple and free from all morbidity. Its germ appears in the kind of bewilderment with which St. Paul speaks of women, but did not mature until the appearance of a form of asceticism which condemned the sexual relation entirely. The sounder mind of the early church rejected this exaggeration, but accepted virginity as the better way and saw an incompatibility between the sexual life and the exercise of spiritual ministration, which eventually hardened into the prohibition of marriage to the clergy in the western church, with effects beyond measure on the relations of priesthood and laity. For the laity itself the church would recognize marriage only in the form of indissoluble monogamy. So far as monogamy was concerned it had no difficulty with the Roman law but a good deal with the customs of the invaders, who allowed chiefs and kings more than one wife. Long centuries later some of the reformers even weakened on the point of principle, giving political convenience to tempt them and Old Testament patriarchs to excuse them. But this was a brief aberration. The matter of divorce was more serious. The Roman law allowed the easy dissolution of marriage. The canonists were not satisfied until in theory they had suppressed it altogether. Separation, in cases of cruelty and gross misbehavior, they had to allow, but there could be no breaking of the marriage bond. Innocent or guilty, the parties that could not live together must live celibate. Yet marriage was not

rendered particularly secure, for although it could not be broken it might be annulled, no matter how long after its consummation, if any flaw were found in its conditions—for example, if the consent of either party had not been genuinely given, or if they were found to be entangled somewhere in the web of forbidden consanguinities, affinities, spiritual relationships. The ramifications of this web were such that it has been doubted whether in the Middle Ages the fully valid marriage was not rather the exception than the rule. The tangle was, however, combed out by the Reformation and, less drastically, by the Counter-Reformation. The Protestants, moreover, denying marriage to be a sacrament, have gradually come to allow divorce, although they have for the most part declined to accept the full consequences of the alternative view that marriage is a contract.

The Roman woman, particularly the matron, had won a status and a freedom scarcely paralleled before, unless it were among the most primitive of men, or since, unless among the most advanced. Some early civilizations, the Egyptian and to a degree the Babylonian, had given woman a good position. It was the distinction of Rome that the position of women improved as civilization advanced, and that, notwithstanding vague general charges of immorality, she gained in freedom without loss of man's respect. Of her freedom one very important element was conserved and even extended by Christianity in the doctrine of free courtship and consent in marriage, noted above. Otherwise the woman, and especially the wife, sank into a position of dependence of which the best one can say in general terms is that it was not everywhere as abject as it was under English law. Fierce punishments for irregular relations signalized the first entry of the church on the scene of legislation, and in this work Reformers were even more ardent than Catholics. The suppression of infanticide was a great advance on pagan morals, but the treatment of the unmarried mother was harsh to the point of cruelty.

Yet in some ways Christianity raised the status of women. The ascetics, in too many of whom are evident clear signs of sexual abnormality, might think of women as limbs of Satan, and yet, upon the whole, Christianity (and not only the Christianity of Christ, but of the churches—the eschatology, the ceremonies, the confessional) made its prime appeal to women, and through the ages it is women who have kept men Christian. Women took a prominent place

among saints and martyrs and have always been in the center of works of charity. Comparative ethics will justify the claim that Christianity brought to fruition a type of womanhood little developed and still less recognized before its time. With the recognition of this type men began for the first time to think of women as of a finer texture than themselves, and romantic love ousted sensual passion as well as mere adventure from the central place in literature. Such opinions may be derided today, but we are here dealing with historic facts, and the attitude to women, which became distinctive of western civilization, is historically one of the most important sociological effects of Christianity and must in fairness be set against those other influences upon sex and family life which were less favorable to the status of woman.

There is probably no one so discontented with the measurable effects of Christianity upon society as the serious Christian. But of the method of estimating these effects as attempted here he will probably say that on such lines we fail to see the wood for the trees. Christianity is a religion of the spirit, and it is in the spirit and not in the outer law that its work has been done. To have established the authority of conscience and widened and deepened the claims of man on man are the great permanent achievements of Christianity, expressed not in specific institutions but in the general spirit of social life. Such achievement is difficult to bring to the test of fact, indeed more than difficult unless we have an agreed system of values. For the sake of argument I will assume what I take to be the standards of ethical rationalism and try to imagine what an ancient rationalist like Seneca or Marcus Aurelius, if he could return to the world, would say of Christendom. I think, then, that he would judge our societies to be full of contradictions and unsolved problems, but to be on balance better and far more full of hope than his. If Socrates were the *revenant* his attitude would be more uncertain. He would no doubt ask us a number of awkward questions, for instance whether automobiles and wireless really make us happier, and, if not, why we spend so much on them; while as to hope he might maintain that even in the humiliated Athens of his last years she lingered at the bottom of Pandora's box. Nevertheless, I think he would come to recognize a larger outlook than that of the city-state, a truer appreciation of the common man than that of the Greek intellectuals and in fine some things

that were not on his horizon at all. I think we could substantiate these judgments in gross by comparisons in detail on the major points. But if, discarding all extravagant claims, we take a favorable view of modern Christendom, we have still to ask how far its advances, or for that matter its backslidings, are due to Christianity and how far to such other causes as freedom of thought, the advance of knowledge, the development of industry and political organization. A very searching analysis would be needed to disentangle factors so intimately interwoven.

But two results have emerged in our brief discussion. The first turns on the discrimination of periods and of churches within Christianity itself. To the ethical rationalist, who on this point at least figures as an impartial outsider, it appears that the sociological contribution of some of the sects has been more notable than that of the official organization, and that if the message of essential Christianity is taken to heart by individuals of all churches, it is enforced collectively only by some churches or only at some periods and in some relations. When so taken, however — and this is the second result — the message goes deep, for this same rationalist, whose natural sympathies are all with knowledge, will yet recognize as an impartial investigator that the scientific view in social applications has suffered from crudities and limitations, and economic advance has been responsible for oppressions and degradations of standard to which essential Christianity is a great corrective. Not accepting its speculative foundations such a thinker is free to criticize its judgments and may not even accept all its principles of valuation, but he knows that the essence of its social teaching must be absorbed into anything that can call itself a rational reorganization of society.

CHRYSOSTOM, JOHN (347-407), church father and doctor. He was priest in his native city of Antioch from 386 to 398 and afterwards patriarch of Constantinople. John's fame as the greatest preacher of the early Christian church won for him after his death the epithet Chrysostom, or "the golden mouth"; both by his contemporaries and by subsequent historians he has been praised as a tribune and attacked as a demagogue. His preaching, especially at Antioch, was devoted to the reform of morals on the basis of early Christian social life. Great wealth was in the hands of a very few excessively rich men, who spent it on luxury. Of the remaining population of Antioch one tenth was destitute and eight tenths lived in comfort. The rich were denounced by Chrysostom for having acquired their immense fortunes by violence, cheating, monopolies and usury, and for their indifference to the distress of the poor. As the result of a law of the empire which made municipal coun-

cilors personally liable for the expenses of the city the old aristocracy could no longer afford, and the new plutocracy refused, to hold office. It was therefore, according to Chrysostom, inevitable that the life of the poor in the agricultural districts was miserable, in the urban districts criminal. Yet he never incited the poor to plunder the rich; on the contrary, he wished everyone to be poor after the model of the apostolic Christians. Following his transfer to Constantinople he carried out his own principles by selling for the benefit of the poor the treasures collected by his predecessor, the patriarch Nectarius. In every sermon he urged alms giving—money, clothes, food, free professional services or a small money contribution to be collected from each family at the end of the business week. Stoic in his philosophic tradition, he maintained that private property and slavery were not natural but conventional, i.e. not in nature but by experience found to be inevitable in human life. In spite of this theoretical justification of slavery, he condemned cruelty on the part of the owner, going so far as to degrade a deacon who had struck a slave. Another phase of Chrysostom's reforms was the reestablishment of a purely Christian education (the Greek of his many exegetical and homiletic works is in perfect style) and of the sanctities of married life. Thus he insisted that the infidelity of the husband was as evil as the infidelity of the wife. He forbade the killing of heretics. His reforms and his sermons brought him into conflict with the court at Constantinople, especially with the empress. He died in exile.

CHUANG TZU (fourth to third century B.C.), Chinese moral philosopher and mystic. Chuang Tzu was born in what is now the province of An-hui. In his youth he held a post as petty official but later he retired to private life and refused all offers of high position. Living in a period of strife between the seven states and of bitter controversies between the rival schools of thought, he developed a philosophy of negation and skepticism which led to a life of inaction and to a sense of futility in the search for truth. To Lao Tzu's affirmation that the Way is to be able

to do nothing he adds the dictum that the Way is also to know nothing. As a mystical idealist and philosophic interpreter of Taoism he raised a bitter cry against the materialism and utilitarianism of the Confucian school. A consistent anarchist, he also preached a doctrine of a golden state of nature and the need for a return to it which is strongly suggestive of Rousseau. All government is, in its origin, inherently evil. The creation of the state marks the beginning of confusion and disorder. All man made rules of virtue and propriety are bad in that they are destructive of the proper harmony between man and his nature. Chuang Tzu never tires of assailing the "sage" and the "model ruler" as those who have brought about man's degeneration from the natural state. Like Machiavelli he develops the idea of the non-existence of a state morality. "How is this so?" he asks. "One man steals a purse, and is punished. Another steals a state and becomes a prince."

Chuang Tzu, as Giles points out, was for many centuries classed as a heterodox writer and as such was of little use to the candidates for official positions at the competitive examinations. As a result he was studied chiefly by older men who had retired from office or who had become disappointed in their careers. At present, however, he ranks as the most imaginative and poetic thinker of ancient China and as the most brilliant Taoist his country has ever produced.

CHUPROV, ALEXANDER ALEXANDROVICH (1874-1926), Russian statistician, son of the economist A. I. Chuprov. After graduation from the faculty of mathematics in Moscow he studied social science in German universities, publishing in 1902 *Die Feldgemeinschaft, eine morphologische Untersuchung* (Strasbourg), a doctoral dissertation prepared under G. F. Knapp. For the next fifteen years he was associated with the economics faculty of the St. Petersburg Polytechnic, where in general lectures and seminar work he trained a number of well known statisticians. Although he was interested primarily in statistical theory he maintained fruitful contacts with practical workers, particularly *zemstvo* statisticians, and contributed articles on such subjects as demography and rural economics. In 1917 he did not

return to Russia from his summer trip abroad. He lived first in Stockholm and later in Dresden, where conditions were favorable to the undisturbed pursuit of scientific work. In 1924 he was elected honorary fellow of the Royal Statistical Society of London.

Chuprov was one of the founders of the modern logical and mathematical theory of statistics. He provided a synthesis of several hitherto uncoordinated lines of thought: the biometrics of Galton and Pearson in England, the investigations of the stability of statistical series by Lexis and Bortkewitsch in Germany and the work in probability calculus by the Russian mathematicians Chebyshev and Markov. In his study of the logical aspects of statistical theory Chuprov attached considerable importance to probability as the basis of the statistical method. To him a statistical measurement represented a reflection, affected by chance, of certain *a priori* relations, which being looser than strictly causal connections could be described as probability relations. In his interpretation of probability as an expression of objectively existing possibilities rather than as the effect of imperfect knowledge he followed A. A. Cournot and to some extent J. von Kries. In the mathematical theory of statistics Chuprov made considerable progress, using the method of mathematical expectation. He criticized and modified the conclusions of the English and some of the German school with reference to the applicability of the law of large numbers in statistical practice and in correlation theory.

CHUPROV, ALEXANDER IVANOVICH (1842-1908), Russian economist and statistician. After graduation from the law faculty of Moscow university Chuprov received a teaching appointment in 1874 and for the next twenty-five years lectured to large classes on economics and statistics. In 1899 he resigned because of poor health and spent the rest of his life abroad, continuing his scientific work. His influence as a teacher was enormous; an excellent lecturer, he stimulated his students to independent interests and trained a whole generation of academic economists and practical statisticians. He edited for publication students' notes of his university lectures on statistics, theoretical economics and history of economic doctrines; these enjoyed wide popularity as texts. No less important was his activity in public life. He was one of the owners, editors and regular contributors to the liberal Moscow daily, *Russkaya vedomosti* (Russian gazette). While serving as president of the statistical section of the Moscow Law Society he turned it into a center for coordinating the work of *zemstvo* statisticians. He was one of the initiators and the intellectual mainstay of the broadly sketched inquiry into the rural economy of the major part of European Russia which beginning in the seventies was conducted by the statistical departments of many *zemstvo* (local self-government bodies).

Chuprov sympathized with the aspirations of Russian populists (*narodniki*) and believed in the desirability of preserving the village community, the *artel* and other peasant institutions. In the field of theory he was close to the German historical-critical school. His contributions along strictly scientific lines include two volumes on railway economics (Moscow 1875 and 1878) which are even at present considered classics, and a number of shorter works on peasant agriculture and landholding, most of which are to be found in a three-volume collection published posthumously (Moscow 1910-11) with a biographical sketch by N. Kablukov.

VLADIMIR E. DEHN

CHUQUET, ARTHUR MAXIME (1853-1925), French military historian and literary critic. The foundation of his broad knowledge of German language and literature was laid during his undergraduate studies at the École Normale Supérieure in Paris and at the University of Leipzig, which he attended for two years as a graduate student. Throughout his academic career, which took him in turn to the Lycée

Saint Louis (1876), the École Normale Supérieure (1886), the École Supérieure de Guerre and the Collège de France (1893), he exerted a considerable influence as professor of German. He was the author of several works of literary criticism dealing not only with German literature but also with French writers, such as Rousseau and Stendhal.

Chuquet is much more widely known, however, as a military historian, and more especially as a writer on the revolutionary and Napoleonic wars. His interest in military history was aroused by the research involved in editing Goethe's *Campagne in Frankreich*, which is a description of the Argonne campaign of 1792. Discovering that there were no satisfactory accounts in this field, Chuquet continued his researches, which he embodied in his doctoral thesis on the Argonne campaign. Thereafter he devoted a considerable portion of his activity to study of the revolutionary wars in a series of eleven volumes (*Les guerres de la révolution*, Paris 1886-96). Additional publications, limited almost entirely to this same field, include *La jeunesse de Napoléon* (3 vols., Paris 1897-99); *Ordres et apostilles de Napoléon 1790-1815* (4 vols., Paris 1911-12); *Études d'histoire* (8 vols., Paris 1903-20); only occasionally, as in *La guerre 1870-71* (Paris 1886-96), *1814-1815*, *De Valmy à la Marne* (Paris 1915) and *Allemands d'hier et aujourd'hui* (Paris 1918), did he go further afield.

In addition to his activities as historian and teacher Chuquet during the period from 1888 until his death edited the *Revue critique d'histoire et de littérature*, which had been founded in 1866 by Gaston Paris and Gabriel Monod. This periodical restricts itself to critical summaries of contemporary publications and has rendered the greatest service to scholarship by condemning unreservedly all works that do not respect the rule of historical method. During the thirty-seven years of his editorship Chuquet was one of the strongest influences on historical study in France, not only through the articles which he himself published, one thousand approximately, but also through his selection of collaborators.

In 1900 he was elected a member of the Académie des Sciences Morales et Politiques. He contributed actively to its work and published an important number of articles in its *Compte rendu*.

CHURCH. See RELIGIOUS INSTITUTIONS.

CHURCH FATHERS is the comprehensive term applied to that group of great Catholic theologians whose activity and influence extended from the middle of the second to the end of the sixth century and who provided the rising church with its framework of dogma and apologetics, its legal supports and its philosophic foundations. They are to be distinguished, on the one hand, from their predecessors, the so-called apostolic fathers like Clement of Rome, Ignatius, Polycarp and Hermas, who, it is assumed, were directly chosen by the apostles or at least had been in personal contact with them; and, on the other hand, from the innumerable later theologians and lay writers whose theological, philosophical and historical works were premised on the already firmly established organization of the papal church of Rome.

The apostolic fathers contributed greatly to the crystallization of the spiritual enthusiasm of primitive Christianity into a system of moral principles and community regulation. With the church fathers, however, the new religion entered openly into the intellectual and spiritual struggle with the forces of classical religion and philosophy. The church fathers of the first generation, among whom Aristides, Justin Martyr and Tatian (second century) were outstanding, are known as apologists since their most important function consisted in defending Christianity against the state and society of classical antiquity as well as against the Jewish rabbis. Those of the next generation, although often classed with the apologists, are more correctly designated as old Catholic fathers, for with them apologetics was subordinated to constructive work.

Corresponding to the general course of Christianity, which spread slowly from the provinces to the world metropolis at the center of the empire, all inspiration for theological development came for a long time from the provinces. Irenaeus (c. 130-c. 200), bishop of Lyons, and his contemporary Hegesippus came from the East, and the mighty leaders of the church from Tertullian (c. 160-c. 220) to Augustine (354-

470) and from Origen (c. 182-c. 255) to Athanasius (c. 295-373) came from Africa and from Egypt.

Tertullian, formerly a highly esteemed Roman jurist but after his baptism a presbyter in his native Carthage, saturated the Christian νόμος, or moral law, with the phraseology and concepts of Roman law. He thus not only provided Catholic discipline and dogmatics with a lasting form but also paved the way for that fusion of divine law, natural law and Roman law which became the basis of all practical scholastic ethics. Tertullian's most important pupil was Cyprian (c. 200-258), bishop of Carthage. Cyprian proclaimed the doctrine of the unity of the episcopal church and of church representation in the bishop and in his struggle with the heretics established for all time the Catholic principle that communion with Christ is impossible without adherence to the church.

Almost contemporaneous with this development of patristics in Africa there arose a catechetical school in Alexandria whose leaders permeated Christian theology with Greek political philosophy just as the Africans had done with Roman law. Clement of Alexandria (c. 150-c. 215) in his homily, *Who Is the Rich Man That Shall Be Saved?* gave a quieting answer to the agitating question of the attitude of Jesus and the church toward riches and the rich. Origen, who was a polyhistorian with a wide view of classical antiquity, Christianity and Judaism and a founder of Catholic theology and systematic theological philology, combined the political philosophy of Plato and the world views of Philo with the teachings of Jesus and of primitive Christianity.

Eusebius of Caesarea (c. 265-c. 340), whose chronicle and church history are valuable for their excerpts from writings and documents otherwise extinct, belongs to that new epoch when Christianity, elevated to a state religion, shed the last vestiges of its apologetic attitude and directed more of its attention to the legal and economic order of this world. At the same time the political and doctrinal feuds of the church assumed a new intensity. Athanasius, the leader of the Egypto-Byzantine orthodoxy, won recognition for the pronouncement of the Council of Nicaea in 325 on the identity of substance in Christ and God the Father, as against Arius (c. 250-336) and his doctrine of the similarity of substance.

It was not so much the Christian theology of the Greek East but rather Christian poetry and

literature which culminated in the fourth century in the "three great Cappadocians," Gregory of Nyssa (c. 335-c. 394), his brother Basil the Great (c. 331-379), bishop of Caesarea, and their friend Gregory of Nazianzus (c. 325-c. 390). Reared in the tradition of Origen they rescued the precious Alexandrian heritage for the Greek church. Their work, which lives today in the liturgy and rules of monks and convents, as at Athos, sealed the fusion of Greek Catholicism with Platonism and neo-Platonism. Among their supporters Chrysostom stands out for his forceful preaching. This period also marks the culmination of western theology in Ambrose (c. 340-379), in Rufinus (c. 345-c. 410), whose translations of Origen, Eusebius, Basil and others secured the work of the Greek fathers for the West, and in Hieronymus (c. 340-420), whose Latin translation of the Bible, the Vulgate, is still revered and used in the Roman Catholic church. All this achievement bore its richest fruit and found its highest intellectual and spiritual expression in the works and activity of that great African, Augustine (*q.v.*), in whom the ancient and the mediaeval, the early Christian and the late Roman theology and philosophy, met and became one.

The church fathers of the fifth and sixth centuries built on the theological and philosophical foundations laid by their predecessors without ever attaining either their eminence or influence. The Alexandrian tradition, which received new impetus under the lead of Didymus the Blind (c. 310-c. 395), found its last effective representative in the patriarch Cyril. Egyptian monasticism, chiefly through the influence of the lives of Egyptian and Palestinian monks written by Palladius (368-c. 431), became the admired prototype of all Christendom. Catholic mysticism was formulated in the work of the pseudo-Dionysius the Areopagite (c. 500). In the West the line of Augustine descends through Martin of Tours and Orosius, the author of an apologetic history of the world, to Leo I (? - 461) and Caesarius (c. 470-542). The latter as bishop of Arles was a popular preacher as well as the creator of the Frankish church ritual. Gregory the Great (c. 540-604) was the last of the great fathers of the old church and the first of the great mediaeval popes.

There is no general and uniform system of political and economic thought that can be ascribed to the church fathers. All attempts at establishing a uniformity of doctrine or of development are faced with the insurmountable

difficulty of differences and contradictions between the various church fathers in the realm of social thought that are as great as are their theological differences. A short survey must therefore limit itself to a consideration of the most important views on some of the most important problems.

First in importance was the relation of the individual Christian and of the church to the secular state. By the middle of the second century, when the work of the church fathers began, the radical tendencies in early Christianity were already confined to influential sects. The views that the state in itself is bad and that earthly rule is a gift of Satan yielded to a more harmonious adjustment. This attitude is revealed in the incorporation of a prayer for the reigning emperor in the church liturgy as early as the time of Clement of Rome (c. 100). Moreover, the theory of the inherent contradiction between the Roman and the Christian ages had been replaced by the doctrine already propounded by Melito of Sardis (c. 180) that God had from the beginning and for all eternity joined together the universal empire and the universal religion, Augustus with Jesus. As long as the empire worshiped the ancient gods and adhered to the cult of the emperor, clashes between the old and the new faith, even apart from the great Christian persecutions, were unavoidable. Neither Origen nor Tertullian nor Cyprian, however, concluded from that the existence of an eternal and inevitable hostility. They established firmly the moral superiority of the divine over the earthly community and pointed out weaknesses and contradictions in procedure, but sought to demonstrate not so much the guilt of the state toward the Christians as the blamelessness of the Christian toward the state. After the establishment of Christianity as the state religion the problem of the relation of a heathen state to the Christian church disappeared. Only rarely, as in the case of Ambrose, had it dawned on the church fathers that the relationship of a Christian state to the church also involved numerous difficulties. The immediate problem was to discover the distinguishing characteristics of the Christian state and its rulers and its essential differences from the ancient state. The solution was facilitated by the generally accepted patristic, as well as stoic, distinction between the natural and the historical state. The way, moreover, was paved by Ambrose who Christianized the stoic doctrine of duties and linked the four cardinal virtues of Plato and of

classical antiquity with the three Christian virtues. It received its form, definitive for over a thousand years, in the work of Augustine, who found the distinguishing mark and valid criterion in the Christian *justitia*, which allots his due to each individual and even to God.

Natural law never attained the same importance among the church fathers as it later achieved in scholastic thought. Nevertheless, or perhaps for this very reason, there was a uniformity of conception never attained in later times. Men of such contrasting natures as Origen and Tertullian, Hieronymus and Augustine, combining the Ciceronian-Roman theory with Paul's words in his *Epistle to the Romans* (II : 15), taught what was essentially the same doctrine, namely that natural law, which is divine law, is inscribed in the heart of man. This *lex dei* or *lex naturae* transcends all earthly and written law. Even God's own Mosaic law, according to Hieronymus, became necessary only because the natural law was either disregarded or destroyed. According to Ambrose natural law is the law of the just; written law is necessary only for the unjust.

While the Gospels proclaim no doctrine of property as such, the uselessness, the danger and the obligations of wealth are clearly pointed in the acts of Jesus and his apostles and in the words of Jesus to the rich young ruler. It was thus an easy transition to the absolute interdict against private property and to the radical demand for a Christian communism. The *Acts of the Apostles*, *Revelation*, the *Epistle of James* and the *Shepherd of Hermas* all prove that there was a strong communistic strain in early Christianity. To be sure, it made no impress on the church; yet it was not only partially realized in the small communities of convents and monastic orders but with few exceptions also influenced the church fathers toward the assumption that property was held in common—at least in the original state, the state of nature. Nevertheless, it must always be borne in mind that religious-communistic thought, unlike modern communism, never expected salvation from the communization of property nor considered this principle of social order as an elementary premise of social justice. What the church fathers believed to be necessary was contemplation, conversion and a fraternal life; but out of these principles proceeded the ethical conclusion, revealed in the ideal Christian state as set forth in the *Acts of the Apostles*, that no one might call anything his own and that

riches impose the obligation to use them for the welfare of all Christian brethren.

All the church fathers looked upon property in general and wealth in particular as a worldly fact and a historical category; their attitude bore no relation to the modern view of the sanctity of private property. A small group, represented by Clement of Alexandria and Lactantius, went so far in their quietistic position as to reinterpret metaphorically the story of Jesus and the rich young ruler as a demand that not wealth but pride and presumption be cast aside. The overwhelming majority, even those who did not lead a monastic life and advocate it as the ideal for all Christendom, agreed that property was an institution made necessary by the fall of man and hence to be tolerated. Wealth can only be endured if the rich man shares it with his poor brethren. Even Clement in another work taught that it was not proper for one man to be rich while others starved. Cyprian declared that property originated only from the confiscation of divine possessions and should therefore be used in common. According to Basil, who was more severe, a man who appropriates to himself what was given to him to distribute is a robber. Ambrose, Hieronymus and Augustine expressed themselves similarly. The most radical teaching of all is that of Chrysostom, friend of Basil. He looked upon community of property, not private property, as in accordance with nature and he considered it inconceivable for the rich man to be a good man. This radical theory of property, as well as the conservative view, continued through the Middle Ages in the works of Isidor of Seville and in the Gratian Decretal, and the former provided the basis for one of the first communistic movements of modern times, that of the Anabaptists of Münster.

"Let every man abide in the same calling wherein he was called," was Paul's teaching (1 Cor. vii: 20). This attitude was characteristic of that early period of primitive Christianity when the return of the Lord was considered imminent and when Christianity's official representatives felt it necessary to guard against all revolutionary tendencies. The church fathers preached and wrote when eschatological hopes had faded, when it was necessary to give the increasing multitudes of the faithful rules and regulations for daily life. The question was now raised whether all callings were really suitable for the Christian; the problem of military service for a Christian was debated and all activities connected with the ancient sacrificial ritual

were forbidden. The attitude toward trade presented special difficulties. The opinion that trade is an undesirable occupation for Christians because it distracts the soul from God was held almost unanimously. Yet trade could not be dispensed with and when the state and the majority of the population were Christian its complete prohibition was out of the question. The only solution was to condemn trade conducted for the greatest possible profit and at the same time to sanction trade restricted to the mere exchange of goods. From the fifth century on, the church established another limitation: laymen were allowed to trade but not the clergy.

The opinions of the church fathers on questions of price and interest followed logically from their views on the problems previously considered. While they expounded no price or interest theory in the modern sense they followed what was implicit in the commands of Christian ethics. If trade in itself was dubious, it was self-evident that taking interest should be forbidden as usurious. The words of the *Gospel of Luke* (vi: 35), "Mutuum date, nihil inde sperantes," formed a guiding principle for all the church fathers. Their position offered greater difficulty in connection with price, its existence and amount. To be sure, the idea of a just price (*justum pretium*) was the governing principle. But even though there were authoritative examples, there were no specific directions as to how this just price was to be determined. Generally speaking, the church fathers condemned as anti-Christian the principle "to buy cheap, to sell dear" and held as just that price which was based on the cost of production or reproduction and which assured a mere livelihood for the seller.

CHURCHILL, RANDOLPH HENRY SPENCER, called by courtesy "Lord" (1849-95), English statesman. After an undistinguished student career at Eton and Oxford he was elected to Parliament in 1874 and remained a member of the House of Commons for the rest of his life.

He was nominally a Conservative but displayed a conspicuous independence of attitude and action. After 1880, when the Liberals under Gladstone came into power, he rose to rapid eminence as the leader of a group of young Conservatives, the so-called Fourth Party, who not only opposed Gladstone with extraordinary vigor and success but also assailed with equal vehemence the feebleness and incompetence of their own nominal leaders.

Although Churchill's behavior brought him into extreme disfavor with the Conservative chiefs, he won so strong a position both in Parliament and in the country by his audacity and efficiency that when Lord Salisbury became prime minister in 1885 he was made secretary of state for India. During Salisbury's second ministry, in 1886, Churchill was chancellor of the exchequer. In the cabinet he was the sole champion of what he called Tory democracy, a policy which was Tory in defending the monarchy, the established church, the Irish union and the constitution generally, but democratic and even socialistic in advocating extensions of the franchise, wide measures of local self-government and bold experiments in social reform. Growing friction between him and his reactionary colleagues culminated in a definite clash over what he regarded as excessive expenditure on the army and the navy. Hence he resigned his office as chancellor of the exchequer in December, 1886, and was never again admitted into the cabinet. Although he continued to support the Conservative government in its resistance to Irish home rule, on other questions he came into violent conflict with it. It was expected that he would join the radical party, but his premature death occurred before any transfer of allegiance had been effected. Churchill's speeches have been collected and published by L. J. Jennings (2 vols., London 1889).

CHYDENIUS, ANDERS (1729-1803), Swedish-Finnish writer on economic subjects. He was one of the most ruthless opponents of the old economic and social order before Adam Smith and an early champion of laissez faire and of the interests of the poor. A clergyman in the north of Finland, he served as a member of the Swedish parliament in the years 1765-66 and 1778-79. In his publications, most of which were brought out as early as 1765, as well as during his brief and stormy political career, he fought against the existing mercantilist system in all its manifestations, such as the subordination of the smaller towns to the capital, the Swedish Act of Navigation of 1724, interference with foreign trade and the granting of bounties to fisheries and industries. His general doctrine was laid down in a small but very remarkable pamphlet, *Den nationale vinsten* ('The national gain: Stockholm 1765; reprinted in his *Politiska skrifter*, Helsingfors 1880, p. 113-35), which is dominated throughout by the idea of a pre-established harmony based upon natural law. He argued that if everyone is allowed to follow his own interests, "private and national gain will merge into one single interest." This system will also extirpate unearned gain and unequal distribution of wealth; "all chances of living without work will be shut out, and no one except the diligent will be well off." It is interesting that he was led to take this position through his intense concern for the well-being of the lower orders, which in a country like eighteenth century Sweden, where industry was little developed, meant principally the rural poor. In the first of his published pamphlets he wrote: "To slave in the service of others so long as they are able, to be thrown away in their old age and left to die in misery: these are the laurels which are meant to kindle in the working multitude a love of their country." Chydenius is perhaps the most forceful writer in Swedish on economic and social questions. He made a great stir in his own day but was soon forgotten and exercised no influence upon his successors in Sweden or abroad. During the last two generations, however, there has been a marked revival of interest in his writings.

CICERO, MARCUS TULLIUS (106–43 B.C.), Roman statesman. He was the leading figure of the Roman bar, the chief prose writer and the principal philosopher of the generation before the fall of the Roman Republic. He was the only Roman who wrote at length on political philosophy. Cicero was consul in 63, suppressed the Catiline conspiracy by unconstitutional means and suffered exile in 58. After his recall the success of the First Triumvirate prevented a renewal of his political career and turned his interest toward literature and philosophy. His opposition to Antony caused his proscription and death after the formation of the Second Triumvirate. He wrote two works on political philosophy: *De re publica* (51) and *De legibus* (published after his death), both of which survive only in part. Although the former disappeared after the twelfth century and was not recovered until 1822, many of its important passages had been excerpted by Lactantius and Augustine and thus the influence of the book continued throughout the Middle Ages.

Cicero's political philosophy was derived chiefly from the stoic Panaetius and the historian Polybius. Its main historical importance lay in the fact that it transmitted the stoic theory of natural law to the church fathers and thus to mediaeval political theorists. In this way the belief that justice, right, equality and fair dealing should underlie positive law became a commonplace in European political philosophy.

From Polybius Cicero adopted the theory of the constitutional cycle and the view that the most stable state is one compounded of monarchy, aristocracy and democracy. But his conception of the growth of the Roman constitution does not agree with Polybius' schematic cycle, nor does his analysis of the Roman magistracies disclose the three elements of the compound state.

The theory developed in *De re publica* includes, besides the regular magistracies, a shadowy "philosophical director" of the state (*rector rei publicae*). Eduard Meyer believes that Cicero's *rector* depicted a role which he intended Pompey to play and anticipated the theory of the principate later achieved by Augustus. It is conceivable, although not demonstrable, that Cicero wrote with Pompey in mind, but the view that he formulated in advance the theory of the principate goes far beyond the evidence.

In politics Cicero, although a *novus homo*, was a staunch supporter of the aristocratic party. He is therefore often charged with toadyism, but

probably unjustly. The shortest road to power and prosperity, after the dissolution of the Sulla regime, lay through the rising popular party. Cicero was not unaware of the decadence of the old aristocracy; he complained bitterly that there were hardly enough men of "virtue" to operate the state even in time of peace. He clung to the aristocratic party, nevertheless, because it was all that survived of an earlier order which to his antiquarian mind seemed ideal. Like Demosthenes, he chose to present himself to posterity as the resolute champion of a lost cause, believing with the stoics that virtue shines most brightly through gallant defeat.

GEORGE H. SABINE

Important works: Cicero's principal works bearing on political philosophy are: *De re publica* and *De legibus* (text and translation by C. W. Keyes, Loeb Classical Library, New York 1928; *De re publica* also translated with notes and introduction by G. H. Sabine and S. B. Smith as *On the Commonwealth*, Columbus 1929); *De officiis* (text and translation by Walter Miller, Loeb Classical Library, New York 1918).

Consult: In addition to the introduction by Sabine and Smith mentioned above, Keyes, C. W., "Original Elements in Cicero's Ideal Constitution" in *American Journal of Philology*, vol. xli (1921) 309–23; Cauer, F., *Cicero's politisches Denken* (Berlin 1903); Meyer, Eduard, *Caesars Monarchie und das Principat des Pompejus* (3rd ed. Stuttgart 1922); Petersson, Torsten, *Cicero, a Biography* (Berkeley 1920).

CIESZKOWSKI, AUGUST', COUNT (1814–94), Polish philosopher, economist and social reformer. Cieszkowski, who was the son of a wealthy landowner, graduated from Heidelberg in the faculty of philosophy in 1838, lived for several years in Russian Poland and France and in 1847 settled on his estate near Posen. There he organized the short lived Polish League, the central national organization for Prussian Poland, and for thirteen years (1848–61) was a member of the Prussian Diet and leader of its Polish Deputies Club.

The key to Cieszkowski's many sided activities is his *Ojciec nasz* (Our Father), a system of philosophy of history which, aiming to reconcile revelation and natural law, detects in the Lord's Prayer an intimation of historical development in accordance with Hegelian dialectics. Cieszkowski believed that the history of humanity displays a gradual growth of solidarity and an increasingly closer approach to God. History is divided accordingly into three periods: the epoch of physical being, or the pre-Christian era; the epoch of thought, which will end with the coming of the Holy Spirit; and the epoch of solidar-

ity, of human brotherhood, the Kingdom of God on earth, for which mankind is being prepared at present by a process of gradual change. This process, in which the Slavic nations, particularly the Polish, will take the leading role, may be accelerated by the adoption of far reaching social and economic reforms based on three general principles: general assurance to each individual of that which he already possesses; general guaranty to each individual of that which he ought to possess, e.g. the standard minimum; general association making it possible for each individual to attain that which he may possess. When the epoch of solidarity is inaugurated, social life will be thoroughly imbued with the spirit of religion and will be identical with the worship of God. All nations will enjoy freedom and self-government and will be united into a universal church managed by the universal government, which will be administered by the highest priest, the universal parliament of mankind and the universal areopagus of nations. The economic organization in this era will be based on the principle of universal association.

In *Ojcie nasz* and other works Cieszkowski specified more concretely the reforms which would accord with his general historical ideas. Influenced as he was by German philosophers, particularly Hegel and Fichte, and by French utopian socialists such as Saint-Simon and Fourier, he could scarcely advocate abolition of private property and thoroughgoing government regulation. Instead he proposed that the government be guided by the principle *aidez à faire et développez*. In respect to agriculture this principle would involve government promotion of credit cooperation and the establishment of public registration of land titles. In forestry, mining and railway transportation the government should compete with private undertakings in order to safeguard social interests. In public finance the chief reliance for revenue should be placed on the taxation of incomes, among which incomes derived from property should carry a relatively heavier burden.

In his principal economic work, *Du crédit et de la circulation*, Cieszkowski outlined a plan for a new currency system based upon his novel definition of credit. He considered credit not as an anticipation of the future but as "a metamorphosis of fixed and invested capital into circulating and liquid capital." State property is a capital which can be mobilized through a credit operation, the issue of interest bearing *billets à rente* protected by mortgages on land owned by

the central government and the municipalities. The *billets* will be much superior to the usual form of currency. Both metallic and redeemable paper money are subject to fluctuation in value and tend to depreciate progressively; but the chief objection to them is that their quantity bears no rational proportion to the values existing in the national economy. He assumed that the *billets* would be free from these faults, but had no opportunity of testing his ideas by experience.

FRANCISZEK BUJAK

Important works: *Ojcie nasz*, 3 vols., written in 1833–36, revised and enlarged 1837–48; the first version of vol. I appeared as *Prolegomena zur Historiosophie* (Berlin 1838, reprinted 1908), and the enlarged version was published in 1848 (Paris, 2nd ed. Posen 1871, French translation Paris 1906); the preface to the work appeared as *O drogach dusza* (On the ways of the spirit) (Posen 1869); vols. II–III first published by Cieszkowski's son (Posen 1899–1903); the entire work was republished in 3 vols. (Posen 1922–23), abridged translation by W. J. Rose as *The Desire of All Nations* (London 1919). *Du crédit et de la circulation* (Paris 1839, 3rd ed. 1883); *De la parie et de l'aristocratie moderne* (Paris 1844, reprinted 1908).

CINO DA PISTOIA (c. 1270–c. 1337), Italian jurist. Cino, or Cinus, was a poet and friend of Dante, whose Ghibelline enthusiasm he shared. He belongs to the school of commentators or post-glossators. After studies at Bologna and in France and teaching at Bologna, his career for some twenty years was that of a practitioner without any settled abode, but from 1321 on he occupied various university chairs in Italy. His opinions (*consilia*), only a few of which are now known, were highly prized. His lasting influence is due to his *Lectura in codicem* (1312–14, best edition Frankfurt 1578). This begins the blending of pure Roman law, at that time dominant through the Accursian Gloss in the schools and in literature, with local statutes and customary and canon law, a task for which Cinus had unrivaled qualifications. By borrowing the developed scholastic method of deduction from the school of French legists (especially Pierre de Belleperche, d. 1308) he was able to go beyond the Gloss and to combine the Roman texts with practical law, thus initiating, by a development comparable to and contemporary with that of a common Italian language and literature, the *usus modernus Pandectarum* as the common law of Italy. Despite his marked anti-ecclesiastical bias he appreciated the equity of canon law, and although he was imperialistic he recognized the claims of local law. In his hands and in those of

his successors (notably Bartolus, his pupil) the scholastic method coordinated these diverse materials under the rule of *ratio juris*. He is thus one of the founders of modern jurisprudence.

F. DE ZULUETA

CITIZENSHIP. From the beginnings of society to the present time all forms of citizenship may be said to have had certain common attributes. As distinct from aliens, serfs, women and children or other members of the community who are passive subjects rather than active partners, citizens enjoy a certain reciprocity of rights against, and duties toward, the community. This balancing of rights and duties explains the fact that everywhere the personal concept of citizenship preceded the development of the territorial concept which, with the rise of the modern nation state, has come to prevail in international law. The ancient Roman notion of *civis* and *civitas*, from which the later concepts of citizenship derive their content as well as their nomenclature (*citoyen*, *cittadino*, *ciudadano*), was originally founded not on domicile but on personality; it was only later that the well known process culminating in the *Constitutio antoniniana* of 212 A.D. extended this personal right of citizenship to the whole area of the empire. The slow building up of the modern rights of citizenship after the renaissance of towns and cities among the Romanic and Germanic nations represents a closely analogous process. In the status of the citizen from the Middle Ages through the first half of the nineteenth century the elements of enhanced protection and freedom from feudal interference are balanced by the invariable presupposition that this status is ordinarily limited at most to a small—in the case of the English "close" boroughs, unusually small—number of land-lords and householders (*Realbürger*) who share the exclusive enjoyment of economic advantages and the exclusive responsibility for the political management of the community.

The modern concept of citizenship, as inherited by the territorial and national state from the ancient and mediaeval municipality, represents a combination of two elements. One of them is the notion of liberty derived from ancient moral philosophy and mediaeval rights of

personal status, while the other is the concept of membership in a political unit, involving co-operation in public decisions as a right and sharing of public burdens, chiefly military service and taxation, as a duty. Each of these components represents in its turn an extensive network of varying elements. Thus the concept of liberty has on the one hand a distinctly abstract and cosmopolitan aspect, traceable in the mutations of this concept from its origins in ancient stoic philosophy through the teachings of the Christian church to the eighteenth century secular doctrines of the "rights of man," which formed a part of the modern "law of nature." On the other hand liberty in occidental law and politics is frequently traced to peculiar national traditions, such as the birthrights of Englishmen, Franks or other mediaeval peoples, which are obviously historical recollections of the age of tribal law and its personal concept of citizenship. Even today the inextricable connection between these two derivations plays a considerable part in the controversies of constitutional lawyers as to whether the "fundamental rights" inserted into many European constitutions after the model of the Virginia Bill of Rights of 1776 are to be construed as rights of men generally or only as rights of citizens of the respective states.

As shown by the terminology of common and international law, another important source of citizenship is the allegiance of a vassal seeking the protection of a feudal lord. It is indicative of the strong feudal influence on English constitutional law that the establishment of the sovereignty of the modern state over its subjects as against that of the church was effected by means of the Elizabethan Oath of Allegiance and Supremacy. It is to be noted, however, that from the later Middle Ages onward the special duties of feudal allegiance were inseparably blended with the general duties of subjection to public rulers and governments. The factual content of liberties and duties was of course determined by a variety of historical circumstances. The rise of a new economic order of capitalistic enterprise and free markets created the need for a more energetic protection—to a considerable extent against government itself—of the citizens' lives, activities and property. Conversely, the victory of the nation state over its feudal and ecclesiastical rivals conditioned the increasing expansion of duties of citizenship through the appearance of new modes of government interference with the freedom of the citizen. The leading Anglo-Saxon countries succeeded al-

most entirely in replacing older, more concrete duties of citizenship, including above all military service, by the abstract "cash nexus" of taxation, but on the continent the great movements of liberation down to the French Revolution produced a revival of extensive imposition of compulsory service. As distinct from both the Anglo-Saxon and the Romanic states the German territorial states have proceeded, under the influence of Lutheran ideas, to enact compulsory education as an additional duty of citizenship; this is perhaps one of the most profound reasons for the peculiar emphasis which German political thought has since then placed upon the intuitive perception of the state as a reality. In the United States the concept of citizenship has been materially affected by the unwillingness of the politicians, who in the Declaration of Independence had mentioned "life, liberty, and the pursuit of happiness" as instances of the "inalienable rights," to place these and other fundamental rights under express protection in the later constitution; and this failure has strengthened still more the supremacy of the courts as final interpreters of the constitution.

The stage which the development of citizenship has reached within the past hundred years is marked by two conflicting trends. The first is an increasing welding of the manifold allegiances of the mediaeval man into a single but comprehensive bond of national citizenship. This integration is effected not only through the multiplication of the claims which the state makes upon the individual but also through the opposite process of reviving the rights of the individual to participation—primarily as voter, elector and representative—in democratic forms of government. The second trend is the continuous extension of intercourse between the citizens of different states and between the states themselves at international law. Even the main lines of this development are far from being clear cut and fixed. The dominance of England and the mediaeval structure of its law account for the all embracing character of its claims to the allegiance of its subjects, whether their citizenship be of territorial or of personal origin (*jus soli* and *jus sanguinis*). Citizenship arising from naturalization, a third and artificial source, for a long time failed, despite its growing importance resulting from an increase in international migrations, to obtain full recognition in English practise. Such recognition was denied not only in cases where it would have been to the disadvantage of England, as in forfeiture of British

nationality through the adoption of a foreign citizenship (first recognized in the Naturalization Act of 1870, 33/34 Vict. c. 14), but also where it would have been to her advantage, as in the protection of naturalized British subjects against foreign compulsion to military service. The United States, as a refuge for the oppressed of the older European nations, provided in contrast to the English rigidity one of the first examples of a liberal and inclusive, but none the less careful, procedure of naturalization, enforcing through the famous Bancroft treaties (1868) protection of its naturalized citizens even against the great military powers of Europe. It is true, however, that the quality of indelibility characterizing the older English citizenships appears also in the old American as well as in the old Russian and present day Swiss law. With regard to the international law of citizenship as a whole, it may be said that much time will be required before even the worst and most frequent conflicts between the interests of the states and those of their individual citizens can be abolished by bilateral or multilateral agreements. The conflicts arising from obligation to military service have lost at least some of their importance, and those connected with taxation are being regulated more and more by treaties as to the avoidance of "double taxation." In the case of taxation, however, the shift in business organization from the personal to the corporate form and the attending international interlocking of business have replaced old difficulties with new; here also the general method of solution appears to be the gradual recognition of residence (seat of head office) as the principle determining allegiance. But new problems are turning up incessantly. Just as the German Nationality Law of 1913 attempted to eliminate the possibility of tacit expatriation through long uninterrupted residence abroad, so recent legislation in the United States and in some European countries has made it impossible for women to lose nationality through foreign marriage. Of the two classic border cases in the conflict of national citizenship laws, the overlapping of nationalities in dual citizens (*subjects mixtes*) and the existence of "stateless" or "apolides," the former is being rapidly done away with through the growing exactitude of municipal and international law. The latter, however, seems to be gaining in acuteness not only because of the great changes made by the World War in the political map of Europe but also because of the intensification in the restrictive character of

nationality laws. Moreover the artificial acquisition of citizenship through naturalization, apparently the logical concomitant of modern international intercourse, is already beginning to come under the sway of racial and other factors tending toward restriction of international migration; in this aspect also there can be no question of steady progress.

Separate mention should be made of citizenship in states with a federal form of government. In these states there may be observed a clearly marked trend toward the extension and unification of citizenship. In the United States the theoretical distinction between the citizenship of the state and that of the union has lost almost all of its practical importance. In the British Empire the Nationality Act of 1914 has theoretically unified the law of citizenship, but practically the former separate citizenship of the dominions has continued to assert itself even in questions of major importance, such as the exemption of residents in the dominions from compulsory service in the World War or the dominion restrictions of colored immigration. The new German republic also carried over from its predecessor the tradition of giving some measure of precedence to the citizenship of the states compared to that of the federation. It is quite likely that a future international confederation, which seems to be foreshadowed by the League of Nations, will also give rise to more far reaching constructions of citizenship. In this connection it is interesting to note the suggestion made by the Argentinean, J. C. Garay, that labor citizenship (*jus laboris*), not involving the loss of original nationality, be granted immigrants who have established themselves in the new country. This recommendation is paralleled by at least two groups of facts in the recent law of citizenship: the extension of the Russian franchise to alien workmen residing in the country (Order of the Central Executive Committee of Soviets, October 29, 1924) and the attempts of Fascist Italy to retain control of emigrants to South America.

The modern terminology of citizenship has not followed the distinction drawn by Rousseau between the "subject" as the passive, and the "citizen" as the active, member of the political community. The reason perhaps is that there has been no sharp differentiation in the underlying development; on the contrary, it has been marked by an ever accelerated increase of citizens and a corresponding decrease of subjects, chiefly through the extension of the franchise to

ever larger groups. The concept of citizenship has thus come to be closely associated with the rise of modern democracy. Similarly, the various forms which citizenship has assumed in different countries or in different periods were obviously dependent upon the degree of participation of the average citizen in the processes of government. While the general course of development has exhibited an increase in the active collaboration of the mass of citizens in public affairs it must not be inferred that such a tendency is necessarily indicative of a rise in political standards; on the contrary, it may often lead to new forms of corruption and oppression and produce a condition similar to the ancient Greek ochlocracy. Moreover it may be accompanied by the loss of such advantages, inherent in every division of social labor, as are likely to accrue from the existence of clearly differentiated groups of specialized public officials and professional politicians. The recent reappearance of government by minority in many parts of Europe, reversing the long struggle of minorities for a better recognition in the traditional systems of representative majority rule, is worthy of note in this connection because such minority government frequently lays claim to creating a more intense and responsible consciousness of citizenship than the majority rule of mass constituencies. This contrast may be reduced in the last analysis to a diametric opposition between two views as to the essential quality of that relationship between the individual and the community which constitutes citizenship. The majority rule relies on rational processes of education and discussion leading to the adoption of a set of rational political and moral ideals; from this point of view a minority appears as a still unconvinced, but potentially conformable, part of the "general will" of the community. Minority rule, on the other hand, stresses the irrational and emotional elements of national and racial cohesion and considers the ruling minority to be either a more or less transitory or a permanent nucleus for the instilling of an emotional conformity.

It does not necessarily follow that the democratic ideals of government by express general consent do not carry within them a strong sentimental appeal. On the contrary, modern democracy has been in many cases, particularly during its struggles with the preceding absolutist governments, distinguished by the passion of its tenets and by its half religious, half poetical symbols. The fighting instinct, inseparable from deep emotions and strong convictions, may serve

not only to lead the community as a whole, regardless of internal strife and injustice, against other communities, but also to inspire a group or class inside the community with determination to effect a redistribution of social or political power. The first case is that of old and new systems of minority rule, characterized by internal rigidity and external aggressiveness, while the second is descriptive of many systems of majority rule characterized by a combination of internal flexibility and external pacifism.

The contrast between the rational appeal of majority rule and the emotional appeal of government by minority is seldom clearly evidenced. Modern parliamentary democracy, as found among the leading nations, is far from relying exclusively or even primarily on the methods of rational education for citizenship which might seem sufficient or best to promote civic adaptation in a progressive nation and in a peacefully stable community of nations. Not in vain did the French Revolution imitate in its political forms and ceremonial what it considered to have been the symbolical expressions of public spirited Greek and Roman citizenship. And at present communities like the democratic United States, Communist Russia and Fascist Italy, despite all their deep contrasts of political structure and ideology, present on the surface so many similarities because each of these communities is, in comparison to other nations, so strongly bent upon utilizing the whole range of civic appeals for the purpose of solving its particular problems of national cohesion. American democracy has developed, in addition to the latest experiments in training school children and adults in political and social thinking, a highly diversified and often romantic cult of nationality, while the minority governments of Russia and Italy are spreading the gospel of Lenin and Mussolini by means of the most refined and mechanized technique of press, cinema and radio propaganda.

CITY. In all ages and areas, from ancient Egypt to modern America, the highest development of human mentality, initiative and achievement has been in urban communities. So long as men remained in the pastoral or agricultural stages there was little stimulus to the differentiation of economic functions; the entire energies of men were absorbed in the task of raising the food supply. But with the city came the division of labor and possibilities for economic surplus, hence wealth, leisure, education, intellectual advance and the development of the arts and sciences.

It is probable that the earliest great cities made their appearance in the valley of the Nile. The earliest city of which we have any definite record is Memphis, the capital of Egypt under the Old Empire, which came to its close about 2500 B.C. Memphis was a walled city situated on the left bank of the Nile about twelve miles south of the present Cairo. With the fall of the Old Empire a new capital was established at Thebes, which is mentioned in the *Iliad* as a city of a hundred gates. Meanwhile other considerable cities developed in the valleys of the Tigris and Euphrates, more particularly Nineveh and Babylon. Babylon was probably the larger of these two communities and undoubtedly the largest of ancient cities prior to the rise of Rome. It was destroyed by the Medes and Persians in 538 B.C.

During the next ten centuries the city life of the ancient world followed the shores of the Mediterranean and the Aegean. Tyre and Sidon, the seaports of Phoenicia, were perhaps the earliest examples of commercial cities, depending for their prosperity on sea-borne commerce. One of their colonies, Carthage, ultimately outgrew the mother cities in size and at her zenith probably had a population of over three hundred thousand. Carthage was the great hive of industry and trade; her people excelled in making goods which were exchanged for raw products, but apparently they had neither time nor taste for developing cultural activities.

Then arose the cities of Greece, which were city-states or self-governed communities, each the center of a vigorous political life. Athens,

Corinth, Sparta, Syracuse and Miletus were not mere palace cities or trading centers or holy places or citadels of defense; they were urban communities in the modern sense, with a high degree of economic vitality. The geography of the Greek peninsula fostered the growth of independent cities, hence most of the free population of Greece lived within the city walls. This does not mean, however, that the people of these communities were chiefly engaged in industry and trade. Large numbers of them owned land outside the city walls and cultivated it mostly by means of slave labor. Athens was of course the largest among Hellenic cities and contributed more to the progress of civilization than all the others combined. As the city grew it divided itself into two parts, Athens proper, which surrounded the Acropolis, and the port or harbor town four or five miles away, the two being connected by a road which ran between long defensive walls. Together the entire community had a population of perhaps a hundred and fifty thousand. Syracuse came next with an estimated population of something over a hundred thousand. Corinth was slightly smaller and Sparta appears to have had not more than fifty thousand. When Alexander the Great proceeded to Asia he took with him the best features of Greek municipal civilization. Greek cities were founded everywhere within the conquered areas, particularly in regions where urban life had hitherto been lacking. Seleucus also established many Greek cities in the East, especially in the region between the Euphrates and the sea. In a word the Greeks demonstrated that what Aristotle called "a common life for a noble end" could be better lived in a city than anywhere else.

Finally, among great ancient cities, there was Rome. Rome as a city was scarcely less wonderful than Rome as an empire. She was the largest and best governed municipality that the world possessed at any time during the first fifteen Christian centuries. Geographically the place had few natural advantages, being twenty miles away from the sea, with no mineral resources near at hand and no large expanse of fertile territory within easy reach. Nevertheless, through the extraordinary courage and virility of her people, Rome developed from a small city to a world dominion. First of all, various small settlements were combined into a unified community; then alliances were made with tribes which inhabited the Italian peninsula; these alliances paved the way to subjugation; finally the power of Rome made itself dominant, chiefly by means

of conquest, through the whole Mediterranean region and indeed over a large part of western Europe. This expansion of Roman power, which resulted in enormous payments of tribute to the capital city, had its natural reaction upon the city's prosperity, making it in time a great metropolis. Rome's maximum population is not accurately known, for curiously enough no census of all the people was ever taken. At regular intervals a census of Roman citizens was compiled, but large portions of the population did not possess the privilege of citizenship. Likewise there was a count of houses but not of their occupants. Estimates for the first Christian century vary from 800,000 to 1,200,000 people; it is probably safe to say that Rome at her zenith contained not far from a million people, which made her by far the largest city of antiquity; and although her population dwindled to less than a half million in the fourth Christian century she was still the world's largest urban community. From that time on, however, Rome steadily declined and in 1377 a census disclosed a straggling town of only 17,000.

Ancient Rome was badly congested, probably more so than any city of modern Europe. Most of the people lived in tenements often four or five stories high. The lack of efficient public sanitation must have made the overcrowding more irksome to everybody, but fortunately the habits of the people led them to spend the greater portion of their time out of doors. In spite of the congestion, however, Rome was a well administered city and achieved a remarkable development in the way of public utilities. Some of the streets were paved; there was an adequate water supply drawn from mountain springs and reservoirs; there were great sewers which emptied into the Tiber. Rome, moreover, was famous for its public baths, of which there were many hundreds, most of them free to the people. In the reign of Augustus an elaborately organized system of police and fire protection was established, with a prefect at its head.

It was in the art of government, in the framing and enforcement of laws and in the technique of public administration that Rome contributed most to world progress. Some of these contributions endure to the present day. Half the world in the twentieth century is governed by codes of law which preserve the fundamental principles of Roman jurisprudence. It was in Rome, moreover, that the concept of a municipal corporation first evolved. The Romans devel-

oped in a large way the legal ideal that a body of men might be clothed with a corporate personality and thus become an artificial person. This idea they applied to their provincial cities, the hundreds of small cities scattered throughout the Roman Empire, which became municipal corporations with a right to hold property.

The centuries following the collapse of Roman power demonstrated to the world what happens to civilization when city life breaks down. The tribes from the north and east which overran the imperial territories knew nothing of urban amenities and were averse to urban restriction and confinement. So the centers of population which had developed a vigorous municipal life in Roman times were pillaged and oppressed. Many of them dwindled into small villages and some disappeared altogether. London, for example, was a place of extensive commerce in the time of Tacitus, but within fifty years after the Romans evacuated Britain the metropolis on the Thames was a heap of ruins, its people scattered, its trade gone and even its streets blotted out. The economic collapse was so complete that it cut all the arteries of commerce. Rome had built up a great system of roads and communications which now went to pieces, and the cities found their chief source of support taken away.

On the continent of Europe many cities owed their immunity from destruction to the intervention of the Christian church. Being the seats of bishoprics they were protected. The invading tribes respected the church when they showed little respect for anything else that was Roman. Everywhere else, during the period from the fifth to the tenth century, the cities of western Europe declined in population, in importance, in trade, in security and in the provision which they made for the comfort and convenience of their citizens. During this period no European city made any substantial progress. Each lived to itself, supplied its own needs as best it could and had almost no intercourse, either economic or cultural, with its neighbors. They were lacking in the two prime essentials of city growth, security against disorder and an economic base from which to draw sustenance.

Beginning with the eleventh century, however, city life showed signs of reviving. These indications appeared first of all in the cities along the shores of the Mediterranean, where the opportunities for the revival of trade were greatest. The crusades, when they came, gave new impetus to the trade of these centers by

stimulating intercourse between East and West. Florence, Venice, Genoa, Pisa and the other Italian cities took advantage of the opportunity to develop important industries, the products of which they marketed in the coast towns of the Near East. A similar revival of municipal life took place in the northwestern portions of Europe, especially in the towns along the Baltic and the North Sea and in the Rhine region. These cities, banding themselves together for mutual aid and protection, became members of the Hanseatic League and by their mutual efforts promoted a revival of trade. Throughout central Europe the renaissance of the cities was not so rapid, but in England the towns achieved considerable growth during the latter part of the Middle Ages and began to play a much larger part in the national life.

This urban revival continued in all parts of Europe throughout the sixteenth, seventeenth and eighteenth centuries, although it was seriously interrupted from time to time by commotions in the city-states of the Italian peninsula, the religious wars in France and such conflicts as the Thirty Years' War in Germany. Meanwhile the discovery of America and of a new all-water route to the Far East gave a marked impetus to all the cities along the western seaboard from the Straits of Gibraltar to the Baltic. Great progress toward urbanization was made during those three centuries in Spain, Holland and England. But it was not until the industrial revolution that the cities really came into their day. The utilization of steam power vastly intensified the drift of population into the cities. In England, for example, only ten or fifteen percent of the entire population was concentrated in cities of ten thousand or more when the industrial revolution began. By the beginning of the nineteenth century this ratio had increased to more than twenty percent and at the end of the nineteenth century it had nearly quadrupled. In the United States at the beginning of the nineteenth century only four percent of the population lived in cities of more than eight thousand. The census of 1930 will probably show a percentage more than ten times as large. The ancient world was one of cities; the modern world is rapidly becoming so.

In early centuries most cities owed both their original location and subsequent growth to considerations of defense. In later centuries London, Paris, Berlin, Vienna, Madrid and Washington have owed much of their growth to political factors, but for the future neither

defense nor politics is likely to play much part in the location and growth of great communities. Among the ten largest cities of the world today there is not a single one that owes its location to a defensible position and only three are political capitals. Trade and industry are the determining factors in the growth of the twentieth century municipality. This is true of city growth in the Orient as well as in Europe and America. The expansion of urban life in Japan, for example, has kept pace with the industrialization of that country. In China and in India the growth of cities has been less rapid than in the West except in the case of those which are located on navigable waters and depend for their prosperity upon the promotion of trade. This is because the industrial organization of the Orient, save in the case of Japan, continues to be for the most part as it was in Europe before the industrial revolution. Each urban community is a relatively autonomous economic unit, supplying its own industrial products and those of the rural areas immediately surrounding, but carrying on little interchange of products with other cities.

In all parts of the world, therefore, cities depend for their expansion on the progress of agriculture, industry and commerce. It may sound paradoxical to say that agricultural advancement is a factor in urban growth, but better agricultural machinery and methods are steadily releasing farm labor from the land and thus promoting migration to the city. It is estimated that by reason of these improvements in agricultural machinery and methods about ten percent of the farm labor in Europe and more than fifteen percent in the United States has been divorced from the soil during the last twenty-five years. It is to be remembered, moreover, that every day's work on the farm gives employment to one or more workers in the city. The man who raises wheat or cattle provides work for men in the flour mills and packing plants; indirectly he also affords employment for workers on railroads, in banks and in the various institutions of credit and exchange.

Industry, however, is a much more important factor in city growth. Since the industrial revolution a large part of the world's industrial production has been concentrated in the cities. Factories go to the larger communities, and where the factories go the workers must follow. Probably nine tenths of the drift from the rural districts to the cities is inspired by the quest

for profitable employment. The city provides industry with superior transportation facilities, an elastic labor supply and a considerable market for its goods close at hand. New factories go where older establishments of the same nature are already located and subsidiary trades congregate around the main industries. Automobile factories, for example, attract various smaller concerns which make batteries, magnetos, tires, tubes, hodies, cushions and a great variety of automobile accessories. Rapid industrial progress in any great city is the outcome of various forces which operate together—transportation facilities, proximity to raw materials, an abundant and flexible labor supply and nearness to a large market.

Commerce is also an important element in urban growth, more important than most people realize. Look at a map of the world and see where the big cities are. With the exception of the national capitals practically all of them are located on navigable waters. That is not a mere coincidence. It proves that facilities for water-borne trade are virtually essential to growth beyond a certain size. The chief reason is to be found in the fact that most great industries desire to bring their raw material by water rather than by rail, inasmuch as water transportation is usually cheaper in the case of materials which are bulky in proportion to their value. Commerce also necessitates the use of credit and secures for the city an expansion of its banking, brokerage and other financial activities.

Agriculture, industry and commerce are thus the primary causative factors in urban growth, but there are secondary causes as well. The city draws heavily upon the leisure class, upon those who have accumulated a competence and desire to be where comfort and luxury prevail. Strangely enough, at the other end of the social scale, most workers and their families prefer to live in large cities despite the higher cost. Educational institutions, historic attractions, climatic conditions and a host of other cumulative allurements have helped to build up certain communities, such as Oxford and Cambridge in England, Florence and Rome in Italy, Miami and Los Angeles in the United States. Every city develops its own individuality; in no two of them are the conditions of urban life and growth exactly alike.

Fundamentally, however, every city is related to what may be called its "economic base," that is, to the source or sources from which it derives the means of livelihood for its people.

As this economic base broadens the city grows and acquires strength; but if by any mishap the base narrows the community stops growing and may even lose ground. Thus we have seen some cities come into existence as the result of a mining or oil boom and thrive mightily for a time on this slender economic base, but with the exhaustion of the oil wells or metal mines they have become blighted almost overnight. Cities, like men, must have steady nourishment.

Thus, beginning with the simplest municipal organisms and passing to the more complex, it is possible to make a general classification of cities according to their economic base. First, there is the community which depends upon a single source of livelihood, for example the large provincial town which serves merely as a local distributing center, gathering up agricultural products and distributing manufactured goods in return. It is not a place of production but of local distribution. Thousands of cities throughout the world fall into this category. They can never become large communities because their economic base is not broad enough.

Second, there is the city which has become or is becoming industrialized. To the function of providing a local point of distribution it adds the role of a producer on its own account. Industrial cities fall into two subdivisions: those which concentrate for the most part upon a single industry and those which have industrial diversification. Essen, in Germany, provides a good example of a one-industry city. Manchester, Sheffield and Leeds in England are of the same general character, although not completely so. Detroit, Gary, Grand Rapids, Fall River and Troy in the United States are heavily dependent upon industries of a single type. On the other hand, a much larger number of industrialized cities have developed on a multiple basis with numerous and diversified manufacturing establishments. Broadly viewed a diversified industrial base is the more secure and better stabilized.

In this connection mention should be made of what has come to be known as the satellite city. Land in the downtown industrial areas of great cities has become so expensive that the factories are drifting to the outskirts where they can obtain all the advantages of a metropolitan location while avoiding the disadvantages of costly sites, high taxes and inadequate room for expansion. These satellite cities usually begin with the establishment of a single industry; then others, usually of the same type, are attracted

and ultimately the place becomes a full sized town with houses for the workmen, stores and places of amusement. A few decades ago the usual expansion of the city was by the creation of new residential suburbs; now we are creating industrial suburbs as well.

Third, there is the city which combines commerce with industry. There is, of course, a close relationship between industrial and commercial expansion. No large city can produce its own raw materials or market all its industrial products locally. It must build up commerce, by artificial stimulation if need be. This further broadening of the city's economic groundwork is of great importance in promoting urban growth. When any city, in addition to being a distribution point for a prosperous territory, adds a few great industries, or a number of smaller diversified industries, together with commercial opportunities, it can have legitimate aspirations to an ultimate population of several hundred thousand. It has been found by statisticians that if one takes such figures as the value of manufactured products in any large city, the car loadings, the harbor tonnage, the bank clearings and the building permits, one can work out a fairly correct estimate of the population.

Finally there is the metropolitan city; in other words, the community that dominates a whole great region and becomes a planet around which various residential and industrial satellites revolve. Smaller communities within the metropolitan orbit have their own specialties, but they distribute through the metropolis for the most part and the agencies which manage the exchange and credit facilities of the whole group are there. Size alone does not make a metropolitan city. There must be a hinterland in economic tutelage to it. Richmond is smaller than Providence, for example, yet Richmond can properly be termed the metropolitan city of its region, which Providence cannot. The economic growth of a metropolitan city usually outruns its political organization. Industrially the whole place is a unit, but politically it often remains a mere aggregation of cities, towns, communes or boroughs. Hence it is in metropolitan cities that the most difficult problems of municipal administration are encountered.

In short, the modern city is an endlessly complicated phenomenon. It is sometimes defined as "a large body of people living in a relatively small area"; but this definition is altogether inadequate. It conveys no intimation of the fact that the city has a peculiar social structure, a

specialized governmental organization, a unique legal status and a highly intricate economic life. A comprehensive definition of the modern city must indicate that it is a social, political, legal and economic unit all rolled into one. It is a concentrated body of population possessing some significant social characteristics, chartered as a municipal corporation, having its own system of local government, carrying on multifarious economic enterprises and pursuing an elaborate program of social adjustment and amelioration.

The significant social characteristics of an urban community can be disclosed by taking as one unit the individuals who constitute the population of any large city and comparing this with another unit made up of an equal number of individuals drawn at random from the rural areas of the same region. The two units will show very marked differences at all points where their respective social characteristics can be statistically compared. They differ in the numerical proportion of the sexes, the city as a rule having an excess of females. They differ in the distribution of their respective populations according to age, the city being stronger in persons of the productive age, that is between twenty and sixty. They differ likewise in the variety and nature of their occupations, their respective birth rates and death rates, the average earning power of individuals, in the proportion of the propertied to the non-propertied classes, in the relative prevalence of illiteracy, pauperism and crime, in the strength of the illiterate element and in their tendency to radicalism of thought.

Compared from any single point of view these differences are not of much consequence, but taken together the variations show a dissimilarity that is both great and important. Everywhere, in all countries, both the individual psychology and the mass psychology of the urban dweller can readily be differentiated from that of the scattered thousands who dwell upon the land. The city is a place where people live in physical proximity but at a social distance. In the rural areas this situation is reversed. Physical distance does not prevent social proximity. The bigger the city the more unsocial it becomes. Between the East Side and the West End of a metropolis there is greater social distance than almost anywhere else on earth.

The city has more wealth than the country, more skill, more erudition within its bounds, more initiative, more philanthropy, more sci-

ence, more divorces, more aliens, more births and deaths, more accidents, more rich, more poor, more wise men and more fools. It is characteristic of city life that all sorts of people meet and mingle without in the least understanding one another. The industrial disputes, so frequent in all large industrial communities, testify to this lack of understanding. The slums and fine residential areas may be separated by only a few hundred yards geographically, but by thousands of miles in point of view, aspirations and conditions of life.

This social disintegration, this complete absence of psychological homogeneity, is what burdens the city with many of its most difficult problems. It makes virtually impossible the securing of a consensus on any project or program of civic betterment. What the business interests propose is usually viewed with suspicion by the industrial workers. Intelligentsia and middle class, politicians and reformers, stand-patters and go-getters pull apart in the city, not together. Unified social leadership becomes next to impossible and group leadership takes its place. The city dwellers think in groups; they become strongly group conscious; hence many of the community's social problems have to be handled by makeshift and compromise rather than by vigorous, unified, constructive effort.

Moreover the city is a unit of government, an agency used by the nation or the state for the better government of the people who live within its bounds. Everywhere the city is the creature of the higher authorities, holding a delegated power to perform certain governmental functions on their behalf and for the sole reason that such functions can be more conveniently performed by the municipality than by the higher government itself. Usually this devolution of power is embodied in the city's charter, but it may be by general municipal code, as in the countries of continental Europe.

In order to carry on the work thus delegated to it the city is provided with a frame of government. It has both legislative and executive organs of government and usually a variety of administrative boards and appointive officials as well; likewise a large number of subordinate employees. The methods of election, powers and duties of these various officials are prescribed by the city charter or by the general statutes. In European countries the devolution of power is by general grant; in the United States it is usually specific, point by point, with

safeguards to prevent any excess or misuse of power by the city. In Europe as a corollary the control exercised over the city by the higher authorities is administrative control, while in America it is chiefly legislative in character.

In the cities of the Orient there has been much slower progress in the delegation of authority from the national and state governments. The municipalities have been held under the close supervision of the higher powers and this has retarded the development of local democracy. But it has not stood in the way of municipal self-consciousness, which is as strongly developed in the East as in the West, perhaps more so. Japan has copied, without essential change, the French system of centralized control over her cities through prefectures and a ministry of the interior. In China the government of the city differs considerably from province to province but in no case is it, under normal conditions, much more than a subdivision of the provincial administration. Both in a political and in an economic sense, however, the oriental city plays a large part in the national life. It supplies most of the leaders and is the starting point for virtually all movements in the direction of liberalism. In their political methods the cities of the Orient are more responsive to Western influences than are the rural areas.

To a larger extent in Europe and America than in Eastern countries the city is an agency of economic enterprise. It is engaged in work which is by no means governmental in its nature. It is a purveyor of water (and sometimes of gas, electricity and transportation), an employer of labor, a purchaser of supplies and material, a seller of service. A large part of what the modern city does is business not government. It consists in furnishing services which would be provided by private enterprise were it not for the fact that the municipality has seen fit to assume the task. It is a self-evident proposition that these economic functions ought to be performed in strict compliance with business principles, but usually this is not wholly practicable because the work is vested in the hands of officials who are under the continuous pressure of political influence. Much of the friction in city government arises from the conflict of economic and political considerations. Efficiency and economy are sacrificed to politics and patronage.

Through other channels, moreover, the city comes into contact with economic enterprises and organizations which it does not directly

control. It is concerned not only with its own municipal water service but with the supervision or regulation of privately owned utilities, such as street railways, bus lines and telephone companies operating under municipal franchises. It has dealings with banks and other financial institutions, for it is a collector, depositor, spender and borrower of money. It enters into relations with contractors and sellers for work and supplies of many sorts in street construction and public buildings; likewise for coal, oil, fire apparatus and so forth. It regulates by ordinance a long list of trades and vocations. It grants permits for the erection of privately owned buildings, for the storage of explosives and other dangerous merchandise and for the placing of signs on or over the streets. All in all, the city, through its government, plays a considerable part in the economic life of the community.

The city is also a corporation at law, a "municipal corporation," as it is usually called. It is invested with an artificial personality, may sue and be sued, own property, make contracts and do in its corporate capacity most of the things that an individual or private corporation may do. It employs officers or agents and in some cases must assume legal liability for what these employees may do; in other cases it is immune from such liability. In general it is immune from liability for the torts of its agents or employees when they are engaged in the performance of a strictly governmental function (such as policing, fire protection or education), but as a rule the city becomes liable for the negligence or default of its agents when these are employed in semicommercial civic enterprises such as municipal gas or electric plants. As a municipal corporation, moreover, the city has the power to tax, borrow money and give in pledge the private property of its citizens. It has the right of eminent domain; that is, the right to take private property for public use on payment of just compensation.

Finally, the city is an agent for the promotion of social welfare. Its officers are busy not only in governmental and economic enterprises but in the work of social amelioration as well. The city provides from the public taxes free education, health protection, poor relief and various types of public amusement. Nearly one half the city's annual expenditure in the United States is now devoted to these social welfare undertakings, including public education. These social welfare functions, moreover, are constantly expanding. Year by year the city is trying to do

more for its people along lines of education, philanthropy, health protection and social amelioration in general. Neighborhood centers, athletic fields, band concerts, mothers' pensions, community dances—these prefigure a score of social outlays which the municipal treasury is making nowadays. The city has become our premier philanthropist. Responsibilities are steadily being transferred from the home to the school, to the public playground or to the civic center. There is no forecasting where this absorption of new welfare activities will ultimately lead.

In a word, therefore, the modern city is not merely a unit of government but a problem in law, in economics and in sociology. It is a many sided affair. It is a place where material motives fill the minds and govern the acts of men; a place of excessive individualism where neighborhood feeling is almost wholly absent, because neighborhood traditions are hard to stabilize with such an incessant shifting of the population. Easy means of communication tempt the city dweller to find his friends and intimates in several neighborhoods. The city man's friends are not, for the most part, his neighbors. They are persons of his own profession, temperament or tastes who live all over the city, sometimes miles apart. Every occupation in the large cities, even that of the mendicant, tends to become a profession, a highly developed profession. The city dweller leads a life so crowded with impressions that little time is left to him for reflection. These impressions are quickly and easily made, but just as quickly and easily erased, for the city mind craves novelty and is impatient of repetition. Its yearning is always for something new, something strange, something bizarre. Thus the urban mentality is restive, impulsive, intolerant of delay, although it is docile enough in its continued submission to public abuses.

Many of the most difficult problems in the modern city arise from the absence of planning. Large communities have grown by accretion without taking much thought for tomorrow. The result is an intolerable congestion in their downtown areas. Nowadays they are making an attempt to ease this problem by replanning the older sections and building new suburbs in accordance with prearranged plans. City planning fundamentally is an enterprise designed to reduce the friction of space. Its outstanding purpose is that of adjusting activities to areas and resources. Industries buy accessibility just

as they buy raw materials and labor. They pay for it in site cost and high taxes. City planning undertakes—by improved methods of transportation, by street widening and by intelligent zoning, as well as by the regulation of traffic—to increase this accessibility without increasing the cost of it. The result is an economic as well as a social gain.

But city planning is not merely a matter of widening streets and creating civic centers. It has legal, social and economic implications as well. It includes within its scope not only architecture and engineering, but law, finances and education. Ordinances often need to be straightened even more urgently than streets. And provision must be made for proper expansion of recreational and educational facilities. Very important also is the planning of ways and means; in other words, planning to use the city's financial resources in such way that all the physical ends may be accomplished without too great a tax burden.

Steam, steel and credit have made the modern city possible. Transportation and storage have made it practicable to keep millions of people supplied with perishable commodities such as meat, vegetables, fruit and milk. Structural steel has made the skyscrapers a possibility. Credit has allowed one generation of citizens to construct and the next generation to pay its share. Rapid transit is centrifugal in its influences; it encourages decentralization in the abodes of the people. But progress in the technique of construction (especially with the aid of structural steel) is centripetal; it encourages the massing together of people in hotels and apartment buildings of massive size. Whether centralizing or decentralizing forces will get the better of the situation depends in part upon the direction which progress in technology will take in the next generation.

The city, in any event, is bound to be a controlling factor in the national life. As the city is, so will the nation be. Its population supplies most of the national leadership. Through its daily press the city dominates public opinion far outside its own bounds. It is stronger in its influence upon political thought than its ratio of population warrants. It sets the fashions—in morals and in manners as in attire. The demeanor of the city is not, therefore, a matter of concern to itself alone. It is of vital concern to all who desire high national aspirations to be established and maintained, for the ideals of a nation are determined by the most influential

among the various elements of its population. Being so determined, they are constantly in process of change. Hence the saying that although men may make cities, it is equally true that cities make men. He who makes the city makes the nation, and indeed it is the cities of the future that will determine the character of the world.

CITY AND TOWN PLANNING. City and town planning may be defined as the art of planning the physical development of urban communities with the general object of securing healthy and safe living and working conditions, providing efficient and convenient forms of circulation and advancing the general public welfare. It aims at the preservation of natural beauty as essential to healthy living conditions, and leads to the promotion of beauty in building as a by-product of sound social and economic growth. The art of planning cities and towns has varied both in importance and in the extent of its development as the city has vacillated between positions of comparative supremacy and subordination in the social system. The periods of urban ascendancy have not, however, always paralleled the periods of greatest activity in planning; and it is impossible to trace much, if any, real progression toward perfection of the physical arrangement of the civic structure. Many early examples of the conscious designing

of cities have been revealed by historians. Kahun, and Babylon, Asshur and Nineveh in western Asia had interesting plans. Piraeus, Rhodes, Thurii, Selinus and Cyrene were planned cities of the fifth century B.C. While most of these early cities were constructed in the rectangular form, similar to the gridiron plan now prevalent in America, a few were laid out in fan shaped form with diagonal arteries. Priene, Miletus, Alexandria and Pergamum are all important examples of Greek planning; the best known early Italian examples are Marzabotto and Pompeii. As a rule the fundamental feature of these cities was the construction of main streets running north and south and east and west to a forum. Between the second and fourth centuries a number of planned settlements were built for discharged soldiers; Timgad and Carthage originated in this way. In the Far East town planning seems to have been pursued by the Chinese in the twelfth century B.C., the form being similar to that of the earlier Roman plans.

The extension of the Roman Empire resulted in the construction of many planned cities. In England, for instance, Roman influence is visible in the well known rectangular plans of Lincoln, Silchester and Chester. F. J. Haverfield has pointed out that the distinctive gridiron plan was the mark of conscious efforts at the improvement of cities, in contrast to their irregular growth in more barbaric periods. Just as we do today the Romans often leveled uneven land to fit their plans; in many cases, however, they apparently selected appropriate sites to which they fitted their plans. As is well known they made drainage and water supply primary considerations. What would now be called zoning was practised with the object of keeping some industries out of central areas and of controlling building heights. In Rome heights of buildings were limited first to seventy feet by Augustus and later to sixty feet by Trajan and subsequently to twice the street width by Nero. These regulations, however, were frequently disregarded.

The chief characteristic of mediaeval cities was their irregularly shaped places, street lines and widths. Instead of long distant vistas, places and streets were closed in, although as a rule the scales of buildings and streets were adapted to each other. A school of German town planners claims that some of these picturesque towns, several of which remain in a good state of preservation, present evidences of having been planned. It is more likely, however, that there

was no definite plan of the street system except to the extent enforced by the necessity of conformity to conditions of military protection. Thus a common feature of mediaeval as of ancient cities was the circular roads following the lines of the fortifications. In the mediaeval towns these lines influenced radial street penetration from the circular walls to the center. The living conditions of the poorer citizens were disregarded in mediaeval times perhaps even more than in Roman cities. In all these early cities there were beautiful public buildings and fine main thoroughfares, but also mean streets and courts in which people lived in overcrowded conditions.

As learning and art were revived in the sixteenth and seventeenth centuries the classical tradition that influenced architecture influenced also the planning of cities, leading to more conscious planning on a grand scale. Princes built great castles and palaces with magnificent processional ways leading to them. In some cities the classic and Gothic types were merged and blended, as for example in Nancy, France, where an interesting plan for a handsome government center was drawn up by Emanuel Héré in 1750-57 as part of an extension plan of the city.

Mannheim and Karlsruhe (1715) are two examples of completely formal treatment. The plans of both towns show the effect of the Renaissance spirit and of royal influence. Inside the Ringstrasse Mannheim is almost completely rectangular with, however, diagonal treatment in the suburban areas. Karlsruhe is of the same geometrical type but is fan shaped with many diagonals converging to the castle.

London lost its opportunity after the great fire in 1666 when it failed to adopt Christopher Wren's plan based on a skilful combination of radial and rectangular lines. In America William Penn made his rectangular plan for the city of Philadelphia in 1682, with streets and squares amply spaced to meet the conditions of his time. Washington, laid out by L'Enfant in 1791 under the leadership of Washington and Jefferson, remains, however, the monumental example in the United States of the advantage of comprehensive planning. Its form is primarily rectangular with a diagonal system of main thoroughfares superimposed on the right angled pattern. The Capitol replaces the castle as the dominant feature.

French influence was important also in shaping the plan made in 1767 for the new part of the

city of Edinburgh. Edinburgh combines an old and a new city, separated by a valley and the high rocky hill occupied by the dominating castle. The old is mediaeval in its characteristics, with narrow, irregular streets; the new is classical in feeling and has straight streets, squares and crescents as its main features. All of these eighteenth century efforts represent the beaux arts type of planning. The coming of the railroad and the machine age interrupted for a time the practise of the art of planning. An exception, however, was the rebuilding of Paris by Haussmann under Napoleon III, one of the most ambitious schemes of replanning and reconstruction that has ever been undertaken. Here too in the rebuilt Paris are the combinations to be found in other old cities that were replanned — the combination of the Gothic, the Renaissance and the modern type.

The rapid urbanization which set in toward the end of the nineteenth century and has continued since at an accelerated pace has given to city planning a new significance and direction. Modern civilization has produced not only the city but the metropolitan region; at the same time smaller towns are increasing in number. The power of the city, based on concentration of wealth and population, makes newly important its construction on lines conducive to health and social welfare.

The modern city planning movement had its origins in a reaction to the rapid and disorderly growth that characterized the latter part of the nineteenth century. One of the best known of modern plans, the Chicago plan, begun soon after 1900, was based on the desire for more order and beauty in one of the most rapidly growing of modern cities. It is the best example of the type of planning, then the dominant type, which frankly called itself "city beautifying." Even within the subsequent development of the Chicago plan itself emphasis was soon shifted from external beautification to the achievement of desirable living conditions, of efficiency in the whole urban structure and of beauty and order as growing out of desirable social arrangements.

Some time before this new type of city planning had become prevalent or even recognized the legal foundations for its development had been laid in both the United States and Europe. The growth of municipal consciousness to which this legislation owed its existence was the result of a reaction against the evils and abuses, especially in regard to sanitation, prevalent in most cities during the nineteenth century. And

it was the demand, increasingly strong after 1870, for improved sanitary conditions and more control of land development in the suburban areas of cities which influenced the form of early city planning legislation.

The effective basis of such legislation in the United States is to be found in the greatly increased responsibilities, giving many a large degree of home rule, which during the past hundred years cities have assumed under special charters and under an extensive series of state enabling acts. The growth of municipal functions has been especially evident in connection with such questions as the control of building development, the increase of facilities for transit, the extension of water supplies, the acquisition of land for public open spaces and improvement in methods of sewage disposal. Abuses of private ownership of property and injuries to health, safety and morals of the inhabitants of cities have been more and more actively controlled through exercise of the police power. It has been necessary to devote increased attention to problems connected with excess condemnation, traffic control, preparation of official city maps, employment of special assessment and many other features connected with the land uses and ways of communication of cities. As William B. Mumro points out in *The Government of American Cities* (4th ed. New York 1926), however, the prolonged battle to overcome governmental inefficiency in municipal affairs did not lead to a substantial improvement until after 1900.

In 1801 the first general planning act of Pennsylvania was passed; and in Massachusetts at about the same time a start was made toward the planning of regional systems of parks, water supply and the like in the Boston metropolitan region. Frederick Law Olmsted's influence, first in New York from 1857 onward and later in planning the Boston park system, had much to do with the development of city planning as an art and a profession in the United States. It appears, however, that general state and municipal activity in planning, as in promoting general municipal improvements, did not begin until after 1900. The work of the succeeding ten years included not only the preparation of the Chicago and other plans for city beautification but the passage of such significant laws as the New York City and Village Planning Law in 1913 and the Zoning Law of New York City in 1916.

Planning legislation began even earlier in

Europe than in the United States. In 1865 Italy passed a law enabling communities having a population of at least 10,000 to make regulatory and extension plans. In 1874 Sweden made statutory provision for the preparation and execution of city plans; this law was revised in 1907 and again in 1917. The first town planning law in Prussia dealing with streets and building lines was passed in 1875 and subsequently amended.

In England the first of the series of public health acts was passed in 1875. These acts have since been gradually developed as the basis for the present public health and town planning laws of England, all of which are predominantly for the purpose of improving housing conditions. Thus the general object of the Town Planning Act (1909) is to improve sanitary conditions, convenience and amenity in connection with the development of the land. When first passed the act was a portion of another act dealing with the housing of the working classes.

Thus the way was prepared for the development of a new awareness among architects and planners of the basic importance of good housing and improved sanitary conditions. The necessary socialization of certain public services with the increasing size of cities has made possible a continuous widening of the scope of city planning. Still all too prevalent, however, is the misplanning which results from combining the piecemeal subdivision plans of real estate developers as the basis for the city plan and from failing to provide master plans for the whole city.

The increasing industrialization of the countries of South America and of the Orient may be expected to lead to new experiments in city planning. In Europe and the United States, however, comparatively few opportunities now arise for planning cities from the beginning, as was done in the case of Washington or St. Petersburg. More frequently opportunities are presented for making plans of village communities and complete suburban neighborhoods, such as the villages developed during the war by the United States government through the agency of the Housing Corporation and the Shipping Board or the numerous examples of model industrial villages planned by individual manufacturers. But the kind of plan most required and most conducive to social improvement is that for the extension and development of an existing city or town. In recent years it has been found essential to extend the scope of city planning so as to deal with regions comprising the total area

having an economic or commuting relation to a central city. The proper development of means of communication in such urban regions involves the planning of areas comprising a large number of adjacent communities. Perhaps the countries which have been most active in official planning in Europe are Germany and Sweden. Here there are active city planning authorities dealing with both the development of new areas and the improvement of existing centers.

The extent of the improvement of social conditions resulting from city planning in Germany has varied as provincial or local habit has encouraged closer or more open development of building. In the largest cities, such as Berlin, the tendency has been toward an improved apartment house development, and the fine tree planted thoroughfares too often screen crowded courts where the people live in two or three-room dwellings.

In France where planning traditions have always had a firm hold on the more cultured classes much has been achieved in the creation of beauty in cities. But of late years carelessness and disorder have set in, particularly in connection with the development of suburban areas. One finds that the charm of Paris may be credited to the work done seventy years ago and earlier, and observes with disappointment the new growth that is taking place all around the environs of the city.

In England achievements have been in the direction of improving social conditions. The modern town planning movement in England, which dates from the beginning of this century, had a distinctly social aim. The benefits obtained from the public health acts of 1875 in the matter of sanitation had been accompanied by ugly monotonous forms of development. The Town Planning Act was devised to secure not only improved sanitation and convenience but more space and beauty in new building developments without increased cost to the communities. At about the same time the tendencies toward increased urbanization led to what was known as the "garden city movement," which has since become the chief force behind town planning developments in England. At Bournville and elsewhere manufacturers had laid out model villages, bringing into relief the cramped and unnecessary ugliness of the modern manufacturing districts. In 1898 Ebenezer Howard published his book advocating garden cities (*Tomorrow*, London) and in 1903 the first garden city was built—a city planned for better social

and living conditions, restricted in size and surrounded by a permanent agricultural belt. Since then, with the interruption of the war, town planning has made rapid progress in England and in the British dominions.

Whereas in some countries town planning encourages the erection of the apartment house and tenement type of building, in England it has had the contrary effect. For example it is now difficult for a community to get authority to permit the erection of more than twelve houses, on the average, to the gross acre of land in its undeveloped areas; and the London County Council is devoting large funds to promoting the dispersal of industries and population outside its own borders and is less aggressive in the work of reconstruction of central areas. Authorities are attacking the slum problem in two ways: one directed toward rebuilding the slums, and the other toward the settlement of new communities within the open fields of the adjacent counties.

In the United States in the last twenty years city planning and zoning have spread all over the country and resulted in great improvements in city building. Other cities have the inspiration of the great example of Washington and of the early work of Alexander Hamilton, the first American to unite city planning with industrial development when he retained L'Enfant to plan Paterson, New Jersey. In a sense the plan that was made for Manhattan in 1811 was a comprehensive plan, but unfortunately it was prepared without regard to the existing levels of the land and without adequate diagonal lines of communication. It also took little account of the uses to which land might be put, and cut up the island into a series of blocks suitable for narrow residential lots rather than for the varied functions of a city.

The lapse in planning which took place in the second half of the nineteenth century in America was part of the world wide decadence of the movement concurrent with the development of the railroad, machinery and manufacturing. As in Europe, America entered what appeared to be a period of renaissance at the beginning of this century, and the movement has been developing strength ever since.

The Chicago plan, prepared by Daniel Burnham under the leadership of prominent business men in the Commercial Club, is one of the finest architectural presentations for improvement of a city in the entire history of city planning. Charles D. Norton and Frederic A. Delano, who later became identified with the Plan of New

York and Its Environs, were among its promoters. Notwithstanding criticisms of this plan as a mere conception of the "city beautiful" it has resulted in enormous improvements in the city and has greatly influenced city planning activity in America. This activity has taken two main forms, first that of comprehensive planning of the ways of communication and land uses, including park systems and civic centers, and second, that of zoning. In 1930 there were about 850 communities in the United States which had prepared zoning plans and ordinances and more than 300 planning agencies at work on general city plans.

The most popular form which partial city planning has taken in America has been that of zoning, particularly of areas built upon. Zoning is concerned with the establishment of districts for the purpose of regulating the use of property and the height area of courts and yards of buildings. It is based primarily on the right of the state to regulate those uses or abuses of property that are injurious to the health, safety and general welfare of the community. Zoning restrictions were somewhat resented at first by the courts and property owners as being an interference with liberty to a greater degree than was necessary for public health. As experience has been gained and zoning extended both the courts and the owners have come to appreciate the necessity of zoning, and the former have shown a growing liberality of interpretation of what is reasonable under the police power.

Zoning in itself is inadequate as a means of guiding the growth of cities. It is an essential part, but only a part, of a well conceived plan. It should not be used separately from such a plan except when and where it is expedient to prepare tentative regulations pending the preparation of a more complete plan. Nevertheless zoning deals with perhaps the most fundamental problems of city development since it fixes by law the qualities of the land for different bulks, heights and uses of buildings. All the zoning that has been done in America may be regarded as an experimental or preliminary phase of planning. It is a temporary expedient to prevent further injury from congestion or indiscriminate mixing of industry, business and residence, pending the development of more complete and scientific planning of cities.

It cannot be said that any definite set of principles for city planning has yet been formulated. In relation to the problems of the modern city the art and science of city planning is in its

infancy. Certain principles, however, have become clear. Thus it is increasingly evident that a thorough study of all the economic, social and physical factors in the city is a necessary foundation for a plan, and the principles that apply to the making of any scientific investigation have to be followed in making such a survey. In the application of the art of planning the same principles of truth, of proportion, of fitness to purpose and of coordination of parts apply to the design of cities as to the design of buildings. The economic phases of city growth are primarily concerned with the distribution and space requirements of its industries. There is a growing appreciation of the necessity of an understanding of the relations between such economic problems and engineering problems. Perhaps it is in respect of social problems that least knowledge exists regarding city conditions, a natural result of the human factors that make accurate knowledge regarding the causes and effects of bad social conditions very difficult to obtain. No city planning can be satisfactory, however, unless it has as one of its main objects the improvement of the housing and neighborhood conditions of the poorer population as well as the prevention of pollution of water and of bad sanitary conditions.

As a science city planning purports to discover the truth about the city in respect to its economic, social and physical conditions. As an art city planning seeks to obtain an economically and socially wholesome arrangement of the ways of communication, of land uses and of building and other structures. More specifically in one important respect it seeks to get that degree of space about buildings which is necessary for health (such as space for light, air and recreation) and simultaneously that degree of building concentration which is necessary for efficiency. Its purpose is best served by resisting congestion or development that is so scattered as to be wasteful.

The survey of a city that is made for the purpose of preparing a plan must cover a wide variety of facts. It should deal with topographical conditions, particularly in relation to industry and transportation; climatic and soil conditions and other natural features. It must include studies of the interrelation between land and building developments and the mapping of all existing physical features. Very important are the surveys of the major economic activities and of problems of distribution of industries, population and land values, problems of transporta-

tion, transit and traffic and their relation to land uses, public recreation and the relation of private and public open spaces. The uses, densities and heights of buildings must be known, as also the methods of plotting and subdividing land and the development of neighborhoods. Sanitary conditions, including sewage disposal, water supply and pollution of water, must be considered. It is also essential to have an analysis of the functioning of the existing government, particularly as it affects planning activities or land development.

Provisions in a city plan vary, of course, according to the law under which the plan is prepared. In general it should include proposals for improvement of rail and water terminals and industrial areas, new and widened highways with classifications of their width and character, public and private open spaces for all recreation needs, civic centers and general location of public and semi-public buildings, treatment of waterfront and other special areas, principles governing control of subdivision of land and zoning regulations. Every plan should also include proposals with regard to the methods of its execution. Perhaps the greatest difficulty at present is the lack of sufficient power to enforce plans and make them permanent.

There can be no hard and fast rule as to the methods which should be employed in planning cities of different size. Differences between the problems of cities, however, arise not so much from differences in size as from differences in functions. If a city is predominantly industrial and self-contained it will require one type of plan; if it is mainly a commuting city it will require another type and should be part of a regional plan. The special problems that have to be considered in a manufacturing city differ from those in a city which, like Washington, is mainly given over to government; similarly a city where education is the main reason for its being must be planned differently from one that is predominantly a pleasure resort. Every city has its own characteristics although the same principles and objects must govern the preparation of all plans.

The chief difficulty in city planning is that of getting adequate public support for a movement dealing with what are usually regarded as intangibles. As a rule cities have no difficulties in appropriating money to investigate specific planning problems however extravagant in conception—such, for instance, as the planning of a great bridge or tunnel—but the planning of the

city as a whole is too general a thing to appeal to the mass of people. At present much money is being wasted in cities in investigating traffic congestion as a distinct and separate problem, although its solution depends on making a comprehensive city plan. People see the traffic congested and they imagine the solution lies in a direct attack on the immediate location of the congestion, whereas it is a local symptom of widespread congestion and wrong distribution of functions and facilities.

The chief pitfalls in planning probably lie in two directions. The first of these is that of making city planning a mere branch of the real estate business and of seeking the stability of real estate values as its main objective. Much zoning is defective and lacks permanence because it is designed on the basis of what the owner of property wants and not with regard to what is best for the welfare of the community. The second pitfall is the expenditure of money on extravagant improvements and on schemes of ornamentation of the physical features of the city while the appropriation of adequate funds for the conservation of public health and amelioration of living conditions is neglected.

The underlying economic principle that justifies city planning is expressed in the commonplace that prevention is better and cheaper than cure. Its purpose is to know the city, including all its defects, and then to seek by planning to preserve what is good, to remove what is bad and above all to prevent the recurrence of the bad. In many cities conditions have to be tolerated that are recognized as injurious to business interests and to the health and safety of the population only because they have been so firmly established as to be too costly to cure. A city plan will inevitably save large sums of money to a community—always assuming it is well conceived—merely by preventing bad conditions at their inception.

An important part of a city plan is the preparation of a budget of expenditures over a period of years which should provide in reasonable proportions for all major expenditures on different municipal undertakings. Indeed planning of a municipal budget can be satisfactory only when it is based on a comprehensive city plan. New ways of communication involve considerable expenditure of money and it is important that the plan direct that expenditure along wise lines; new parks cannot be obtained without purchase, and in planning a park system the problem is to show the best locations for parks in advance of

development so that they can be selected in the right place at reasonable cost. On the other hand all the benefits of zoning that are held to be "reasonable" by the courts can be obtained without any cost; for this reason, among others, when zoning is used in combination with a complete plan it is perhaps the most important phase of city planning.

Obviously the social values of a city plan depend on its being prepared, as it should be, with the primary object of improving social and living conditions. The mere preparation of such a plan, preceded by an ample investigation of conditions and public discussion of facts and projects, has a high social value. But its greatest social values can be obtained only if it is carried into effect. If a plan is well conceived and well proportioned, if it is supported by adequate state laws and intelligently administered, it should result in promoting social values unobtainable by any other means. It should not only secure a well balanced distribution of buildings, more space about dwellings for penetration of light and air, and larger areas for public and private recreation in proximity to dwellings, the lessening of congestion, more convenient transportation facilities and greater freedom of movement for traffic; but it should lead also to the development of a wholesome community background for social life as a result of well planned neighborhood units, and greater sense of order and regard for beauty on the part of the entire population. Finally it is important to recognize that the planner cannot build the city but can only show the citizens how they should build it. In an important sense, therefore, city planning is an educational process.

CITY MANAGER. The "city manager plan," or, more accurately, "council manager plan," was instituted in Staunton, Virginia, in 1908 and became nationally important in 1914 following its adoption by Dayton, Ohio. The number of municipalities adopting this plan has grown steadily until in 1930 there were more than 400. After 1918 it spread into the larger cities, including Cleveland, Cincinnati, Rochester, Fort Worth, Miami, Grand Rapids, Kansas City (Missouri) and Norfolk. Full data concerning it are published annually in *Public Management* (Chicago), the official organ of

the International City Managers' Association.

The essence of the plan consists in the appointment by an elected council of an administrative official called the city manager, whose term of office is indefinite and in whose hands is placed responsibility for managing most city business. Specifically, the manager is authorized: to appoint without confirmation of the council the highest administrative officials and, with or without the assistance of a civil service commission, the subordinate personnel; to direct them in the performance of their duties; to discipline and remove them when necessary; to plan and guide business operations; to prepare and submit to the council the annual budget; to recommend to the council policies and programs. In short, the council manager plan theoretically places all responsibility for administrative and business operations on the manager, except that the school system is usually separately administered by a board of education.

The responsibility for making decisions concerning municipal policy, for defending such policies before the public and for furnishing the political leadership of the community is vested in the council and the mayor. The council retains full authority to enact ordinances, to make appropriations, to develop comprehensive plans for municipal development and to select and discharge the manager. The mayor loses administrative power but remains to preside over the council, to participate in its deliberations, to represent the city on ceremonial occasions and for the service of legal writs and to assume, if he chooses, the political leadership of the city. The charter usually directs that the manager be chosen without reference to political affiliation or local residence and frequently forbids the council to interfere with his duties.

This form of government, therefore, in sharp distinction to the commission plan, makes a clear separation between politics and administration and establishes a single responsible head for all business operations.

With a few exceptions it has been notably successful. A body of professional city administrators has been developed, substantially free from political considerations, governed by a high sense of obligation to the community and alert to improve their technique. Adequate popular control is insured by recurrent election of the council and by the frequent provision of the initiative, referendum and recall.

CITY-STATE. The term city-state is applied to an autonomous state composed of a city and its outskirts and revealing a more or less clearly defined distinction between a bourgeois and a peasant class. The outstanding examples of the city-state of antiquity were in Phoenicia, in Greece and in Italy; in the Middle Ages the most typical city-states were in Italy and on the coast of the North Sea.

At first sight the *polis* or ancient city-state seems to have been constructed according to a definite plan; in Rome, for instance, there were three ethnic tribes, thirty curias, three hundred senators. But this superficial uniformity conceals profound social variations. In many cases the tribes or clans, from whose amalgamation the city developed, had widely different customs and religions. This is true of the Albans and the Sabines, two of the constituent elements of Rome. Moreover the centuries of warfare which preceded the foundation of the *polis* left ineffaceable distinctions between victors and vanquished. The institution of helotry and the peculiar form of agrarian organization in Sparta were perhaps survivals of the Doric invasion; and it is not yet determined to what extent the line between patricians and plebeians in Rome indicates an ethnic difference.

The *polis* retained in weakened form many institutions of the larger clans: fraternities of warriors (phratry); large family associations (*genos* in Greek, *gens* in Latin); age groups; communal banquets (*syssity* in Sparta and analogous customs in Carthage and in southern Italy). The ancient division into ethnic tribes of common origin persisted in Athens until the time of Clisthenes and in Rome until the royal epoch, when they were replaced by local tribes organized on the basis of domicile. Another great change made by the *polis* in the course of its development was the liberation of the individual from the tyranny of the *genos*. The *polis* thus destroyed the essential characteristic of primitive law: family solidarity which, in making the family as a whole responsible for the wrongs

committed by each member, had been an important source of feuds and internal disturbances. G. Glotz (*La cité grecque*) divides the entire history of the city-state into three periods, determined by the changing relations of the family, the individual and the state: "In the first, the city is composed of families who guard their primordial rights jealously . . . ; in the second, the city suppresses the families with the aid of liberated individuals; in the third, the excesses of individualism ruin the city, making necessary the establishment of more extensive states."

The origin of the ancient city, the force which was responsible for its establishment, has been the subject of much dispute. In the nineteenth century Fustel de Coulanges set forth the theory that the foundation of the city was essentially a religious phenomenon. The nucleus was the family, centering about the hearth, before which the father of the family, who was also a priest, conducted the worship of the ancestors. The union of several families established the hearth of the phratry; and the union of the phratries established the hearth of the tribe. "As soon as the families, the phratries and the tribes had agreed to unite and have the same worship, they immediately founded the city as a sanctuary for this common worship" (Fustel de Coulanges, *La cité antique*, p. 177). In reality the *polis* was the result of an economic evolution. At the foot of a citadel, dating perhaps from the Mycenaean age, a market was established and artisans settled. Out of two elements, therefore, the *acropolis* (with which the word *polis* was originally synonymous) and the *astu* (group of business and residence buildings located on the plain), the city developed. The progress of the cities is inseparably bound up with the development of commerce. In Phoenicia and in Greece the regime of city autonomy developed in trading cities near the sea and the achievements of these mercantile cities served as models for the communities which were still mere agricultural markets.

The institutions of a large number of ancient cities show a parallel course of development, the various stages of which may be correlated both with changes in economic structure and with the evolution of the army. At first the city was controlled by the heads of the *genos*, who composed an oligarchic senate, limiting the action of the king; these were the rich and noble warriors who went to battle in chariots. Later on, with the rise of a class of propertied peasants

and with the growth of movable wealth caused by the progress of commerce, a timocratic constitution was established, placing power in the hands of the rich without consideration of nobility; this change coincided with the organization of phalanxes of hoplites. The difficulties involved in the transformation of a state primarily agricultural into a state primarily mercantile explain the appearance of the tyrannies. Partly as a result of the increase in personal wealth (or the lowering of the tax qualification), partly as a result of the organization of a fleet and the growth of a class of sailors, political control was transferred from the tyrants to the people. Then came into existence those direct democratic institutions which constitute the chief political peculiarity of the *polis* in this stage of its evolution and which were made possible by its narrow territorial limits: the drawing of magistrates by lot, rotation in public functions, state bounties to assist citizens in the fulfilment of their public functions, recall constantly threatening magistrates, and the power of the popular assembly both to issue decrees having the force of laws and to act as sovereign judge.

The *polis* has its mediaeval counterpart in the free commune of Italy and Flanders. While the evolution of the institutions of the commune constitutes a problem in itself the commune and the *polis* show such striking similarities in so many of their characteristics that a comparison throws light upon the inherent tendencies of the city-state. Both developed under essentially the same conditions. Just as the *polis* had its inception after the period of invasions called the "Greek Middle Ages," so the commune appeared after the Carolingian period, springing up like the Ionian and Phoenician cities near the sea or at the centers of traffic networks. Just as the constituent parts of the city-state of antiquity were the *acropolis* and the *astu*, so the commune was the product of the castle-fortress (*burgus*) and the market (*portus*) and in both cases the sanctuary was in the heart of the city. Geographical conditions played their part in the liberation of the commune from the feudal lord as they had in the protection of the autonomy of the *polis*. It was not by accident that the *polis* flourished in mountainous Greece and in the island or cape settlements of the Phoenicians; or that the free communes were usually located on strategic sites, around canals as in Flanders or on an archipelago as in Venice.

The mediaeval commune, like the city of old,

was a liberal force: as the *polis* had released the individual from the tyranny of the *genos*, so the commune destroyed the monopoly of freedom which the nobility had formerly enjoyed. Both ancient and mediaeval cities engendered a rigorous patriotism. The class of hereditary citizens constituted a kind of nobility, united by a strong feeling of solidarity, which found practical expression in social legislation, stipends for children orphaned by war and pensions for invalids. Such celebrations as the Panathenaeon festival or the worship of St. Mark at Venice were not merely religious but patriotic. There were, however, powerful elements of disintegration, important among which was the conflict between the military and the commercial interests, resulting usually in the victory of the latter and eventuating in the replacement of the soldier citizens by mercenaries. The rival free cities were constantly in arms against one another, while family feuds were a cause of frequent civil wars. As a result of the impetus toward economic and social legislation the poorer classes tended toward communism. Abolition of debts and division of land became part of the program of the most radical groups. The social conflict was more serious in the mediaeval cities, where the artisans were organized in guilds. Another source of internal disturbance arose from the attempt to subordinate the city to the country. The struggle between the urban class and the farmers, which was developing during the autonomy of Athens and was perceptible in Carthage, became acute in the mediaeval cities.

The free commune of the Middle Ages, like some of the mercantile cities of antiquity, was not a self-sufficient organism. Because of excessive population resulting from the growth of industry and commerce the city was obliged to import most of its necessities. The state met this problem by seeking to gain control of certain imported commodities. The Athenians were permitted to load ships with wheat for Athens only and the Venetians were compelled to transport commodities exclusively to Venice. The foreign policy of the ancient and mediaeval cities was dominated by the desire to open markets for trade; their efforts were directed toward establishing fortified trading posts in foreign lands, multiplying their colonies and founding empires by levying tribute on foreign cities. Thus the commercial city became consciously imperialistic.

The city was so constituted as to render its

development into a large state very difficult. Even Rome did not altogether succeed in adapting her municipal institutions to the administration of an empire. The Greek cities sought to solve the problem through the instrument of confederation. The reason for their failure is well illustrated by the case of the Boeotian cities, which in trying to extend the institutions of direct democracy outside the city-state rendered the central authority almost powerless. No less serious than these political difficulties was the weakening effect of the restrictive economic policy, which finally resulted in curbing progress and in fettering exchange. The free city, unable to withstand the accumulated strain, declined and finally disappeared.

Ancient political theorists described the city-state as agrarian rather than mercantile, and thus seriously misunderstood its essential nature. Plato subordinated the producing class to warriors and philosophers; he regarded proximity to the sea as dangerous and desired to abolish private property and even money. Aristotle considered virtue and not wealth to be the true goal of the city. As their model city-state both Plato and Aristotle unreservedly accepted Sparta, which was no more than a camp piously preserving the customs of prehistoric times and hardly deserves to be classed as a city-state. Only in modern times has the true nature of the city-state been understood. It is the modern theorists who have recognized and appreciated the importance of the merchants in the organization of the mediaeval communes. The economic factors in the development of the *polis* are more difficult to determine because of the nature of the sources available, but there is no doubt that the merchants exercised a determining influence in the growth of the cities of Phoenicia and of many of those of Greece, while in Rome the enfranchisement of the people was perhaps due in part to the activity of the merchant colony established in Aventine.

CIVIC ART is a term which is most properly applied to the entire aesthetic aspect of the city. Many of the most important elements of civic art, such as the pattern of the streets, the grouping of buildings in functional zones, the provisions for open spaces and parks, the entrances for various means of transportation, are fundamental considerations in programs of city and town planning. But there are many other factors. These include not only the specifically monumental parts of the city, such as its statues, memorials or public buildings, but also many of its more strictly utilitarian features such as street names, lighting fixtures, transportation facilities, letter boxes, fire alarms. The character and harmony of residences and public buildings and the nature of street advertising are other important aspects of a city's appearance. It is the nature of the entire composition, including all such elements as these, that determines the quality of civic art.

In the classic city the importance of local deities and other gods caused a concentration of temples and monuments on a dominating site, usually a place of final refuge in war, and other civic structures such as theaters, choragic monuments, basilicas, were grouped about the same site. The residential districts were aesthetically of relatively small importance. In the mediaeval city the market place or the cathedral square or the castle hill were the places where civic pride was concentrated; great resources were lavished on the guild hall or the cathedral, toward whose towers or spires the animated silhouette of domestic roofs and chimneys drew the eye. Except in the classic cities of the Alexandrian period or bastides of the fourteenth century the

street pattern was informal and the simple vernacular buildings served as a sober background for a splendid public art.

The Renaissance made several distinct changes in the appearance of cities: it created the open plaza; it made the formal garden an accessory of civic architecture; it grouped the finer types of residence around small parks or squares; and by opening up and formally arranging the avenues it created a street picture of perspectives and distances. These avenues often terminated in squares, crescents, circles and stars; and the proper embellishment of the plan with statues, monuments and public buildings became of great importance. The impulse responsible for the civic art of the Renaissance was that of an oligarchy seeking to embody in public building the good manners and humanistic cultivation of the gentleman. What lay behind the façades was neglected, however, and hence the imposing residential quarters of seventeenth century Paris or eighteenth century London often concealed dilapidated workers' houses, dingy backyards and mews.

In the nineteenth century, with the rise of machine industry, the proportion of urban space dedicated to industrial enterprise was increased. The little handicraft shop was replaced by the large factory, supplied with fuel and materials brought in by rail; large sections of the new city were brought hastily into existence without any consideration for the relation of the prevailing winds to smoke, the isolation of noxious industries, the zoning of manufacturing and commercial areas or the segregation of noisy and dirty industries. With occasional exceptions the new railway stations, factories, office buildings, department stores and iron bridges, though they often occupied dominant sites, were erected with as little thought for group harmony as for architecture. The mere push of enterprise brought into the very heart of the industrial city vast railroad yards which occupied valuable land, cut across the natural lines of growth, broke up the coherence of the civic whole and contributed noise, dirt and congestion. With paleotechnic industry came a large population on the margin of subsistence, the housing of which in tenement houses like those of Glasgow, Berlin and New York, in monotonous rows as in London, Manchester and Philadelphia or in boxlike shacks as in the smaller middle western towns, was a final negation of civic conscience.

The first self-conscious attempts at civic art in America were in devising cities of Renaissance

pattern, as in Penn's original plan of Philadelphia and L'Enfant's Washington; but the most successful examples of the actual existence of civic art occurred before 1800 in New England towns like Sharon, Amherst, Newburyport, Stockbridge, where open spaces, public buildings like the church and the school, dwelling houses and the mill or tannery were unified by a coherent pattern, the common quality of the building and the connecting arcades of trees. The effort to achieve such beauty in design disappeared early in the nineteenth century, and by the middle of the century the chaotic ugliness of the new quarters of cities called attention to the need for a deliberate program of civic art. This was first manifested in the planning of Central Park, New York, 1856; later of Fairmount Park, Philadelphia; and finally in the masterful metropolitan park systems of Kansas City and Boston. Another important influence was the Chicago World's Fair in 1893. This gave an impetus to a widespread effort to achieve the order and dignity of Renaissance planning, particularly through the creation of civic centers, such as those subsequently erected in Cleveland, San Francisco, Denver and Springfield, Massachusetts. Meanwhile some of the essential problems of modern civic art were being altered. The skyscraper introduced a new dimension into the city plan which had no relation to Renaissance scale and design; and the preemption of desirable sites by such monuments of business enterprise as office buildings and hotels often made more difficult the problem of the grouping of important public buildings.

In the actual administration of civic art projects commissions for city planning and civic centers are necessarily concerned to some degree, but there are also many agencies whose activities are directed primarily toward improving the aesthetic aspect of cities. This cannot be done with any measure of success unless the fundamental requirements of utility, convenience and sanitation are also taken into account, but where officials and laymen work together with artists there is little likelihood that these considerations will be forgotten. Municipal art commissions have been founded in nearly all cities of the United States since the early years of the twentieth century. Almost invariably the scope of their activities is limited to advice and judgment concerning land and structures "of a permanent character intended for ornament or commemoration" and belonging to or about to belong to the municipality. Thus limited, the

activities of such commissions can come within the police power, but their interference on purely aesthetic grounds with any objectionable use of private property is almost unanimously overruled by the courts. A typical decision of this character argues: "However desirable it may be to encourage an appreciation of the beautiful in art and to cultivate the taste of the people of the state, still it has never been the theory of our government that such matters could properly be enforced by statute when not connected with the safety, comfort, health, morals, and material welfare of the people. . . . The courts of this country have, with great unanimity, held that the police power cannot interfere with private property rights for purely aesthetic purposes" [*Haller Sign Works v. Physical Culture Training School*, 249 Ill. 436 (1911)].

Whether the police power may eventually be extended to include offenses to the eye within its jurisdiction, as offenses to other senses are now included, whether a constitutional amendment will be necessary in order to achieve such supervision or whether the people of the United States will continue to insist on this expression of personal liberty, is not yet clear. There have been occasional signs, however, that the concept of police power may be found once more to be extensible to the uses in hand. A significant indication of possible future trends is the fact that the Planning Act of 1927 in California, in addition to the customary provisions for general city planning, provides also for "the improvement and control of architecture and general embellishment of the area under its jurisdiction."

Another impediment to the success of municipal art commissions is their tendency toward stale "official" art. Usually their membership includes not only ex officio municipal servants but also a representation of artists and competent laymen. This provision, however, has not always resulted as satisfactorily as might be hoped. The earlier commissions frequently tended to favor the feeblest kind of classic or Renaissance design for civic monuments and this attitude did much to undermine their authority. Their attempts at the "City Beautiful," as their movement was called, were further discredited by the superficial character of many of their projects and their indifference to civic art as a whole.

Great strides have nevertheless been made in recent years and there are indications that a more informed taste is being directed toward the

problems of civic art. There has been no more effective contribution to civic art in America than the New York ordinance for limiting the heights of buildings and ensuring a modicum of sunlight and air in crowded skyscraper areas; nothing could further modern civic art more than an attempt, such as has been suggested by Le Corbusier in France and Raymond Hood and Henry Wright in America, to space and limit high buildings in relation to the needs of traffic, transportation and full access to sunlight. The improved design of stations on the new subways of Boston and New York, the improvement of both color and design in the modern gas tanks of New York, the unified design of the municipal piers of Manhattan and the Army Supply Base in Brooklyn, are the earnest of a civic art that springs directly out of contemporary needs.

The interests of civic art have also been served incidentally by institutions of a non-official or semi-official character. These are of various types: neighborhood business organizations such as the Association for the Protection of Fifth Avenue in New York; local civilian organizations concerned with good pavements, clean streets, trees and standard quality in residences; professional societies of architects, painters, sculptors and landscape gardeners; national associations such as the American League for Civic Improvement; women's clubs; and periodicals devoted to municipal affairs and public improvements. Sometimes the activities of such organizations are impelled largely by real estate interests or town boosting and in many cases their success also has been limited by the artistic incapacity of their members, but altogether their activities are doing a great deal to improve the aspect of urban communities and also to convince the public of the need of such improvement.

European countries, less hampered than the United States by constitutional restrictions, have been considerably in advance of the United States in control of matters relating to civic art. The movement began there earlier and has made further progress. Official supervision of private building is a matter of course in European cities and frequently professional artists serve as expert advisers. City planning commissions are particularly aware of the artistic possibilities of their activities, an attitude which is not always conspicuous in the United States.

In the future efforts toward the improvement of civic art will probably be concerned with the development of the city as a whole and not

merely with grand avenues, civic centers or monuments. Among the objectives of such a program will be the full utilization of natural features, such as hills and waterfronts, making them subservient health and recreation as well as such commerce as is necessary; the planning of neighborhoods as units, related to playgrounds, parks, schools, libraries and local shops, instead of as a nondescript part of a larger unit; the establishment of a high standard of group housing; the zoning of factory districts and commercial districts and their maintenance at a high level of cleanliness and order; the electrification of railways that enter the heart of the city and the appropriation of the space above the tracks for building or parking space; the elimination of every form of competitive advertisement in public places and the limitation of necessary signs to a height and color harmonious with the street picture; the planning of new parts of the city with relation to their aspect from the air as well as the street and the establishment of important functional centers and building sites in advance of the street plan; the insulation of residential sections from main traffic arteries; and the provision of more or less continuous park belts free from vehicular traffic for the use of pedestrians and children at play. Most of these objectives are now incorporated in the English garden cities, Letchworth and Welwyn, and in the new American exemplar, Radburn; and they have been adopted in part by other cities. In such a program the monumental aspects of civic art are reintegrated with the development of the city as a whole.

CIVIC CENTERS represent one of the earliest forms of civic achievement. The Forum and the Acropolis were the civic centers of Rome and Athens, respectively, and there was scarcely a city in the ancient world without what might be called a civic center, in which on important occasions the people assembled. The finest examples of modern civic centers are to be found in Europe, such as the new civic buildings in Vienna and Stockholm and the town centers in the modern English garden cities like Letchworth and Welwyn. In the United States, too, are several notable civic centers. In many American cities plans have been prepared for civic centers in connection with comprehensive city planning projects. Among the more notable are those of Cleveland, Ohio; Hartford, Connecticut; Denver, Colorado; the Gateway Park of Minneapolis; San Francisco, California; Springfield, Massachusetts; the Art Museum and other cultural buildings on the Philadelphia Parkway; the capitols of Minnesota, Nebraska and other states. The crowning achievement in the United States in the planning and construction of public buildings is the National Capitol at Washington.

Civic centers are not necessarily confined to public buildings for strictly governmental purposes but often include buildings devoted to art, music and the drama. As such they constitute an essential element in city development, and of first importance is their location with regard to the city as a whole. They may be grouped as one center or as various centers, formally or informally, according to the local requirements and the opportunities for convenient and interesting development. Public buildings forming the civic center are rightly placed when grouped in economically suitable locations readily accessible to the public. The great increase of traffic in modern cities necessitates avoidance of excessive centralization of buildings, especially if they include large assembly halls.

As one of the chief problems in the planning and development of cities is the provision for their growth, the location of public buildings should be designed with reference to the expansion of the city. Municipal buildings, court houses, halls of record and buildings of similar character are naturally located near or within the central business district. Custom houses and

post offices, however, are more closely connected with the railway and waterway terminals, although it is important that a branch post office should be readily accessible from the shopping district. Public libraries, law courts, municipal auditoriums and other buildings of like nature may be suitably located on the edge of the business district, and in some cases within important residential districts. In any case these buildings should be somewhat removed from the downtown business center.

The location of public buildings naturally depends upon the general structure of the city, especially the street system and transportation. While civic centers may be advantageously placed on prominent streets in a rectangular system or composed with principal intersections in an irregular system of streets, yet for the most important groups the best location is at a focal point where more than two thoroughfares come together.

Civic centers gain from a well ordered and attractive grouping of buildings numerous and varied advantages. They include such factors as additional convenience in the transaction of both public and private business; the reduction to a minimum of the interference of public buildings and grounds with private business property and general business interests; recognition in the location of the civic center of one of the most important features of a natural zoning system carrying with it incidental advantages in building requirements and fire protection; economy in the purchase of a larger tract of land which can be acquired at lower rates; better use of the same amount of land as a result of a skilful grouping of buildings; more permanence of the civic center and therefore greater stability of land values in the zone in which the public buildings are located; the securing of a margin of land for future expansion and adjustments without unnecessary expense as the need for additional public buildings develops. The grouping of municipal buildings in one center serves also as a check upon speculative interests and reduces or eliminates much of the delay and bitterness which often result in clamoring over the selection of a site for each new public building. A logical place having been selected, the erection of buildings from time to time follows as a matter of course in accordance with a preconsidered scheme. A municipality also gains financially from increased taxes due to the higher value of property near a permanently established civic center. This provides a neighborhood for the erection

of hotels, theaters and office buildings, which naturally seek locations adjacent to an attractive civic center group with its surrounding open spaces and parks.

Again, an attractive and well planned civic center brings large dividends in aesthetic pleasure when the city invests in architecture and other forms of outdoor civic art. A better effect can be secured for the same money, or an equally good effect for less money, than would be possible in the case of buildings without orderly relation to each other. An effective combination of architecture, sculpture, landscape architecture and gardening in a single harmonious composition is possible in such a center. This grouping permits municipalities to engage more highly qualified and experienced men to make plans. A unified civic center can be made to provide not only suitable locations for civic sculpture and the appropriate adornment of open spaces but also facilities for the incidental requirements of parking space for automobiles, convenient trolley car and bus transfer points and public comfort stations.

A civic center needs a dominant feature or building and should be so placed as to provide for a good vista along the main street or axis of the plan. There should be a proper sense of scale in the relation of the shapes and sizes of the open spaces to the shapes, sizes and locations of the surrounding buildings. Good results require harmony of materials and of architectural styles and unity of the composition as a whole. The problem of protecting the integrity of civic centers against the encroachment and greater height and dominance of commercial buildings is particularly difficult in the United States. The principal measures that can be used by municipalities are zoning and the acquisition of sufficient property by the city to control the outlook and environment of the civic center.

Civic centers cannot be standardized. They should be distinctive and individual and expressive to some extent of the special character of the city itself—its climate, its population, its needs. The problem of a city's buildings is always a local one and must be worked out, if it is to be successful, from a careful survey of local conditions. In all cases, however, the problem must be stated with regard to the conditions as a whole and with a foresight that takes into account the city's growth. Above all, a civic group should be so placed and designed as to stimulate local patriotism and civic pride. It nourishes civic life, without which a city cannot truly grow and

flourish. A well conceived civic center aids a city in its competition with other cities. It gives form to community efforts and inspires and guides the development of private property.

CIVIC EDUCATION, in the broader sense, is the process of passing on to successive generations the traditions of a community. As in other social processes there is in education a tendency to supplement and replace habitual and unconscious procedures by conscious and rational methods. Such an increase in rationality and purposefulness of education may be detected even in the more or less elaborate religious cults which succeeded the cults of the tribe and the family. These religious influences were an important factor in the development of the political homogeneity in antiquity and the Middle Ages. In antiquity they were felt through the absorption of all religious cults in the city-state, and in the Middle Ages through the intellectual and moral predominance of the church over all political communities.

Civic education, in the narrower sense of the term, dated from early modern times when with the destruction of the world wide citizenship of the Christian *Civitas Dei* the secular governments became concerned with fostering, on a markedly secular plane, the tradition of civic allegiance. The task was difficult. For a long time governments failed to develop a school system of their own which should replace or at least compete with the age old educational institutions of the church. The churches, on the other hand—even the Protestant cults—clung tenaciously to their first claims on the minds of men, in England and in America perhaps more forcefully than in Lutheran Germany and Scandinavia. The chief difficulty, however, was found in the fact that "nationality" as the basis

or the modern secular state was often a doubtful and artificial aggregate of smaller but older racial and territorial communities. The new education in that period, just as after the World War, was therefore forced to assert itself against two opposing forces. It conflicted not only with the older allegiances to communities whose sovereignty, merged in that of the nation state, might be revived in regional, sectional or "pluralistic" aspirations but also with the newer allegiances to cosmopolitan ideals: the pacifist strivings for a *comitas gentium* or the more realistic attachments to various red, gold, black and green "internationals."

While the early modern state as the absolutist guardian of its subjects was scarcely aware of this struggle, a complete realization of its import was inevitable with the progress of modern democracy. For democracy as such not only involves a considerable advance in the rationalization of social and political relations, but the revolutionary triumphs of democracy—from the French Revolution to the revolutions at the close of the World War—have brought about a shift in the opposite direction—the first great transference to the political field of passions that were previously virtually monopolized by religion. The state, however, made but slow progress in asserting its supremacy. In France the revolutionary program for the *laïcisation* of education was not carried out until legislation at the end of the nineteenth century effected the separation of church and state. Even at present there are in France both advocates and critics of secular education, and, paradoxically enough, the cult of nationalist ideals is particularly pronounced among the proponents of religious education, who combine it with loyalty to the Catholic church. In post-war Germany the multiplicity of conflicting ideals led the National Assembly of 1919 to embody in the Weimar constitution a remarkably comprehensive provision (article 148) enjoining all schools to develop "moral education, civic sentiment [*staatsbürgerliche Gesinnung*] and personal and vocational efficiency in the spirit of the German national character [*Volkstum*] and of international conciliation [*Völkerversöhnung*]." It provides also for the introduction of civics and manual training as compulsory subjects and for the distribution of copies of the constitution to graduates of the schools.

Modern governments encounter a still further difficulty in attempting to utilize civic education for their exclusive benefit. Instead of succeeding

as sole heirs to the educational monopoly of the church they have had to divide the inheritance with a large number of other spiritual powers, likewise bent upon molding the modern secularized communities. Among these powers political parties and the press, which was at first almost entirely in the service of parties, were of quite special importance, because the less they shared the views of the government and the ruling classes the more strenuous was their devotion to questions of civic education. Thus the liberal bourgeoisie of Europe and America, when in opposition to the older aristocratic systems of government, had the formidable advantage of directing civic education along lines of modern scientific training. The next wave of political opposition, that of the more or less socialistically minded working classes, lacked this new educational content, but it had the compensatory advantage of securing the adherence of the masses through an elaborate technique of open and secret agitation, supplemented by the training of speakers and itinerant lecturers. The continuous development not only of the press but of the cinema, radio and many other vehicles of public education and propaganda into self-sufficient and self-supporting services seems to open an ever widening competitive market where all types of old and new creeds, political and non-political, can hope to win public attention and government support and thus to become fairly important factors in the molding of national types.

At present the question of the educational supremacy of the modern state, already foreshadowed in the principle of state control of all education, appears to have reached a new and critical stage. The non-European governments, particularly that of the United States, confront the necessity of building up out of innumerable racial and social groups at least a likeness of the European nation state. In Europe the governments created by the political revolutions, like the Bolshevik or the Fascist, face the task of tightening the reins of educational freedom in order to extinguish in the germ counter-revolutionary ideologies and to foster new mental attitudes. In each case, however, the requirements of the situation may be totally different. In America the assimilation of immigrant stocks and colored races is complicated by the relative absence of social stratification and the excessive mobility of the population. In Russia the task is to educate rapidly by "American" methods of organization and publicity an illiterate and not

easily accessible peasantry to a rationalistic creed like Marxism. In contrast to this, the Fascist government in Italy is attempting the emotional training of a western nation, half liberal and half Catholic in temper, for an all inclusive form of proud, conscientious and combative nationalism. In addition many other features of modern civic education may be shared in common by various countries, for example the constantly recurring contrast between militarist-nationalist and pacifist-internationalist programs, the general trend away from differentiated social and regional types toward a stereotyped mass, and the significance of modern preventive and educative repression of crime as an agency in the healing of social conflicts. Even the newer, least established parts of modern civic education exhibit the restless activity of society in substituting new allegiances and ideals for old.

CIVIC ORGANIZATIONS. Civic organization is the generic term applied to any non-partisan group of citizens who have associated themselves for the furtherance of some public cause or enterprise. Such organizations multiply their numbers in accordance with the increasing complexity of political, social and economic relations; hence they are most numerous in urban areas where this complexity is greatest. In large communities the individual citizen feels a sense of helplessness in the protection of interests which may be affected by public action. His business, his property, his means of getting to and from his work, his family life, his health, his recreation and his personal liberty may be adversely touched by the laws and ordinances un-

less he has organized to forestall such action.

Nearly all civic organizations, therefore, are pressure groups. This does not mean, however, that their purposes are necessarily selfish. On the contrary, the aims of many civic organizations are related to the ideals and not to the self-interest of their members. The objective may be one immediately to be reached, such as the voting of bonds for a new city hall, or it may be some distant goal, such as the carrying out of a new city plan. It may be an objective which concerns only a small section of a single municipality or it may be one which attracts support on a nation wide scale.

In some measure the growth of civic organizations has been due to the shortcomings of democratic government under the party system. It is the theory of democratic government that the individual citizen can exert a sufficient influence upon the direction of public policy through his membership in a party organization supplemented by his right to a free exercise of suffrage at the primaries and at elections. This assumption may have been warranted in earlier days, when the public authorities concerned themselves with relatively few, simple, easily comprehended problems of a political nature. Under the conditions of today, however, the problems of public policy are neither few, simple nor easily comprehended. This is especially true of the cities. What we call problems of politics are for the most part problems of economic and social amelioration. On such issues the membership of a political party is divided and subdivided into almost innumerable smaller groups of interest and opinion which do not feel that they can function effectively through the major organization.

Many civic organizations, indeed, owe their existence to the perversions of party government, especially in the large municipalities. Party machines, when they get control, place the advantage of the politician above the interests of the citizen. The result is that men devoid of administrative skill and training are put into positions of large responsibility. Popular distrust in the capacity of municipal and state officials is the mainspring of that host of civic organizations whose objectives are to keep taxes down or to prevent needless borrowing on the public credit or to endorse candidates or to insure honest elections or to keep close tab on the award of contracts or to secure the publication of assessment lists.

While it is possible to group American civic

organizations under several headings, it must be borne in mind that no classification can be hard and fast, for there are many organizations which shade over the line from one type into another. It is also to be remembered that while an organization may profess a certain creed of aims and purposes its activities may be in fact considerably removed from the purposes declared. The Tammany Society or Columbian Order, to take a conspicuous example, is still by profession an organization engaged in work of social benevolence.

First, there are certain organizations which may be called semi-official because their membership consists entirely or almost entirely of persons who hold positions in the public service. Sometimes they are intercity organizations such as associations of mayors or of city managers. Within individual cities, moreover, there are organizations of public school teachers, policemen, firemen, street employees and so on. The activities of these organizations are in part constructive but in larger part protective. They aim to acquaint their members with new developments in their respective fields of work and thus to promote group efficiency, but they are more deeply concerned as a rule with the securing of increased pay, fewer hours of work and the protection of their members against unjust dismissal.

In many cases these organizations are to all intents labor unions and some of them are affiliated with the American Federation of Labor. This affiliation is regarded as unobjectionable in the case of street employees and workers in the other physical departments of municipal administration such as buildings, parks and sanitation. But in the case of school teachers it has sometimes been frowned upon by the educational authorities, and as respects policemen the objections to outside affiliation are deemed so strong that in many cities it is forbidden. In the United States there is no general federation of municipal employees' organizations similar to that which has been built up in Great Britain as the National Association of Local Government Officers.

The higher administrative officials in American cities have, however, created various national organizations for the discussion of their own special problems. Thus the International City Managers Association includes most occupants of this position in the cities of the United States and Canada. Heads of municipal departments have such associations as the American

Institute of Park Executives, the American Society for Municipal Improvements, the International Association of Street Sanitation Officials, the International Association of Chiefs of Police, the American Association of Port Authorities and many others of the same sort. These organizations hold meetings annually or oftener with papers and discussions on matters of professional interest. Some of them have their own periodical publications.

Other semi-official organizations draw their membership in part from the higher administrative officers of the cities but in larger part from those lay professions which come into frequent contact with municipal administration. Such, for example, are the National City Planning Conference, the National Conference of Social Work, the American Waterworks Association, the National Tax Association and the American Public Health Association. These bodies draw into their conferences large numbers of professionals and laymen who are especially interested in landscape architecture, social work, water supply, taxation and public health respectively.

One of the notable developments of the past quarter century has been the new emphasis placed upon scientific research as a pathway to civic betterment. This development began in 1906 when the organization which was incorporated the next year as the New York Bureau of Municipal Research began to undertake thorough studies of various civic problems chiefly of a technical nature. The results of such studies were used in two ways: first, to show public officials the opportunities for improvement within their own departments, and second, to educate the municipal citizenship in matters which are too complicated for the average voter to understand without guidance. The success of the work of the New York Bureau soon led to the establishment of similar research bureaus in other cities, some of them supported by private contributions, others maintained by regular appropriations from the public treasury. Most of the larger American cities have now provided themselves with organizations of this character although they are sometimes known as Bureaus of Public Efficiency or Bureaus of Public Administration. Meanwhile the New York Bureau undertook to carry on investigations and to make surveys in other cities when requested to do so. In this way its work enlarged to a national scale and it changed its name to the National Institute of Public Administration.

The value of research as the initial step in any proposed civic betterment became recognized by some of the larger chambers of commerce, taxpayers' associations and citizens' leagues. In most of the larger cities the chamber of commerce now maintains a committee on municipal or on metropolitan affairs with research facilities as a basis for its work. Some taxpayers' organizations, such as the California Taxpayers' Association, make research their chief activity and devote to it large appropriations each year. Various state leagues of municipalities have also provided themselves with research departments. Finally, there has been set up in Washington an Institute for Government Research maintained by private contributions with the object of making thorough studies into the mechanism and methods used by the national government in carrying on its varied activities. It has published a large number of books and service monographs embodying the results of its studies.

The rapid development of these institutions of governmental research all over the country disclosed the need for some central organization which would serve as a clearing house to prevent needless duplication of work by the individual bureaus. For this purpose the Government Research Association was organized. It is made up of governmental research bureaus and institutes throughout the country, holds an annual conference and endeavors to correlate the work of its constituent members.

A third and very large group of civic organizations consists of those which are maintained for the purpose of promoting specific measures of governmental reconstruction and reform. These specific purposes cover a wide range and are of such variety that it would be impossible to make any comprehensive classification of them. A few examples, however, will serve to indicate their scope and methods.

Nearly all problems of government have financial implications and most of them have a bearing upon the tax rate. Hence the largest single category of civic organizations is made up of those which have as their principal aim the continuous scrutiny of public expenditures with a view to inducing economies and keeping the tax rate within bounds. There are taxpayers' leagues or associations in most of the states as well as in nearly all the larger cities. These leagues differ greatly in organization and in the methods which they employ. Some are mainly concerned with the definite and immediate problem of keeping the tax rate down, others

with a reform of the tax laws, still others with the task of getting better returns for existing public expenditures. In this connection mention should be made of the real estate exchanges and realtors' associations whose members have a special interest in the rate of taxation on real property and in the methods by which special assessments are levied to pay for public improvements. A few taxpayers' organizations have as their objective the substitution of one type of tax for another, particularly the substitution of income taxes for taxes on intangibles. A few are propagandists for the adoption of the single tax.

Another large group of civic organizations is composed of those which are concerned with the specific problem of improving the personnel of public administration by the more extensive use of the merit system. They are known as civil service reform leagues or auxiliaries, and most of them are affiliated with the National Civil Service Reform League. Unconnected with these organizations but with much the same ends in view is the Bureau of Public Personnel Administration, a privately supported institution which renders advisory assistance to state and local civil service commissions in the administration of the merit system.

Nearly every serious problem in state or local government provides the incentives for a civic organization to help deal with it. Thus the problem of securing a widely ballot at elections has given rise to the Short Ballot Association, while the quest for an adequate representation of minorities has resulted in the formation of the Proportional Representation League. There are national organizations to promote the adoption of the initiative and referendum (National Popular Government League) and to prevent the granting of too favorable franchises to public utilities (Public Franchise League). Another national organization is engaged in promoting the cause of municipal ownership (Public Ownership League of America). There are also a National Smoke Prevention Association, a Playground and Recreation Association of America, a National Housing Association and a National Highway Traffic Association.

In individual cities, moreover, there are local problems which seem to call for organized effort on the part of those interested; hence the large number of civic associations with aims which are specific, local and immediate, such as harbor improvement, the abolition of grade crossings, the launching of a publicity campaign to make

the city better known, the annexation of some neighboring municipality, the adoption of an improved system of traffic regulation, the abatement of some specific nuisance and so on. From city to city these organizations differ greatly in number and in their specific aims. Many of them, moreover, have objectives which concern only a small portion of the municipality, usually some outlying section.

Chambers of commerce, boards of trade and merchants' associations are organized primarily to promote the interests of business within their respective communities. They endeavor to attract new industries, to exploit the commercial advantages of the region and to enhance the local business prosperity by every legitimate means. To secure these results, however, it becomes essential that the local tax rates shall not be excessive and that the borrowing power of the municipality shall not be injudiciously used. Hence these commercial organizations find themselves drawn into contact with the public authorities on questions relating to budgeting, borrowing and new sources of public revenue. Usually they maintain special committees which represent the interests of the organization in all such matters and the part which they assume in the molding of public policy is often a very large one, especially in the smaller cities. The same is true of the so-called service clubs—Rotary, Kiwanis, Lions, Optimists. Although their aims are not primarily civic in the customary sense of the term they are often mobilized to promote some public proposal, such as a bond issue or a new charter. Since the adoption of woman suffrage, moreover, there has been a rapid growth of women's civic leagues and similar organizations.

Finally, there is the broadly reformist type of civic organization, including all those which do not seek to bring about some individual or specific result but are impartially concerned with the improvement of public administration in its manifold phases. The National Municipal League and the American Civic Association are examples of such organizations on a national scale. Similarly there are many state organizations whose function is to procure betterments in the structure and methods of state and local administration. Virtually all of the larger cities and many of the smaller ones have civic organizations of this type which function within the municipal boundaries. Such are the Good Government Association of Boston, the Municipal Voters' League of Chicago, the Civic

League of Cleveland and the Municipal League of Los Angeles.

A word ought to be added concerning those titular civic organizations which merely serve as screens behind which self-seeking private interests are able to operate in the name of moral uplift or civic patriotism. Such bodies, with alluring names, are active in all parts of the country. They are financed in each case by a few corporations or individuals with selfish ends to serve but who naturally find it advantageous to push their propaganda under the cloak of altruism while they themselves remain out of view.

Comparing the situation in the United States with that which exists in the countries of Europe one finds that American civic organizations are much more numerous, more varied in their activities and more energetic in their work. The reasons for this may be found partly in the American penchant for organization and partly in the strong individualism which characterizes American public policy. In European countries the tendency is to let officialdom take the initiative rather than to have it assumed by groups of private citizens. The collectivist and paternal spirit in European government has procured for the people at the hands of the public authorities many things which in America have been left to private auspices. Of considerable importance, moreover, is the European practise of using lay citizens on official boards and commissions to represent such business or sectional interests as may be directly or indirectly involved. Finally, the need for group pressure upon government in the interest of economy, honesty and decent administration has not been so great in Europe as in the United States. Civic organizations to cope with such sinister phenomena as the spoils system, police corruption, public extravagance, dishonesty at elections, the debauchment of local politics by public utility corporations, tax evasion, crime waves, ring rule, bossism and the rest—such organizations have not been urgently needed in Europe because the conditions which called them into existence here have rarely existed there.

The methods used by civic organizations in the United States are as varied as their names and purposes. But in general there are three channels through which they all seek to operate. The first is by a liberal use of printers' ink. Some of them have their own regular publications which are sent free to their members. Others get out pamphlets, circulars and booklets from time to time and distribute these widely. This activity

is customarily known as a campaign of education. A second method is the focusing of direct pressure upon congressmen, members of state legislatures and city councilmen. Through paid officials or by delegations of members the various civic bodies appear before legislative committees or at public hearings to urge their aims or to voice their protests. Most of them make it a point to follow closely all projects of legislation and the larger organizations often retain salaried legislative agents or lobbyists for this purpose. Pressure is also exerted upon the legislators through indirect channels - by stirring up voters in their home districts to send telegrams and letters of advocacy or protest, by communications to the newspapers, by the procurement of editorials and often by enlisting pressure service from financial institutions which can influence individual legislators. A third method is by active participation in the nomination and election of candidates for public office. Some civic organizations inspire and arrange candidacies; others content themselves with endorsing or publicly stating their disapproval of such candidates as are put forward by the party organizations. This action may be and usually is followed up by campaign work and contributions to secure the election of those who have been endorsed.

The civic organizations of the United States run far into the thousands. Their combined membership must mount into the millions. Together they spend a very large amount of money each year. Yet the results which they have obtained and are obtaining do not seem to be commensurate with their strength and financial outlay. For this there are several reasons. To begin with, civic effort is overorganized in America. There is a considerable duplication and overlapping of work, involving a waste of energy and funds. There has been much working at cross purposes. Many organizations have purposes which clash with one another—for example, one of them seeks to shorten the ballot by reducing the number of elective offices, while another by promoting the use of the initiative and referendum would inevitably lengthen the ballot. One civic organization works energetically for some public improvement which would put taxes up, while another is equally vigorous in its efforts to keep taxes down. Much organized civic effort is thus dissipated through activities which merely neutralize one another.

Another reason may be found in the relatively ineffective leadership which many civic organi-

zations have had. This leadership has not combined idealism with practicality. The leaders of reform in all its branches are for the most part men and women who do not depend for their livelihood upon the success of their adventure and hence do not usually make it their first care in life; they rarely become masters of the subject with which they are assumed to be concerned and they sometimes devote to one another a good deal of animosity which ought to be concentrated upon a common foe. The tactics employed by civic organizations, moreover, have often been unwise. They have lacked adroitness and political sagacity—seeking often to gain in a year what requires a decade of time or endeavoring to attain the whole of a reform without patiently taking the preliminary steps. The work of civic organizations, moreover, has often been spasmodic, going by fits and starts, while the opposing forces stay on their task continuously. Nevertheless these organizations have accomplished much. It is to their activity that we owe a large part of the improvement which has taken place in the temper of American public administration during the past generation.

There is no book on American civic organizations. A list of the more important ones, with a brief statement of their purposes, may be found in the *Municipal Index and Atlas*, published annually in New York since 1924.

CIVIL DISOBEDIENCE. See INDIAN QUESTION; OBEDIENCE, POLITICAL.

CIVIL LAW. The term civil law has been understood in various ways. Generically it designates all the rules of law governing the members of a given political state (*jus civitatis*). In this sense civil law comprises all the juridical rules which govern the relations of men in civil society. It is thus practically synonymous with the concept of law itself, and in this aspect it will be treated in the general article on law (*q.v.*) and in the articles devoted to the various branches or systems of law. The term civil law is used here in the sense which it began to have in the Middle Ages when it was applied to the revived but transformed Roman law which was being introduced into the continental countries. It was not long before civil law meant to Europeans "private" law (the law governing the

ordinary relations of private individuals), probably because the Roman law which formed the basis of their civil law was particularly distinguished by its great degree of development in dealing with private relations. The basis of this civil law, while fundamentally Roman, will be seen, nevertheless, to contain many other elements derived chiefly from the canon law, Teutonic laws and feudal laws as they gradually underwent modification in the course of the centuries. The civil law has "common law" as well as statutory phases. But to the common law lawyer it means simply the Romanized system of continental law in contradistinction to the system of common law which developed in England. It is only rarely that he uses the term civil law in the sense of private law.

Civil law has received not only its fundamental elements but its name *jus civile* from Rome. When the barbarian invasions began to sweep over the Roman Empire, the Roman law had entered upon a period of codification by means of imperial constitutions, a process which was comparatively unimportant in the classical Roman law. Although the Twelve Tables have usually been considered the origins of Roman private law, it had in reality been developed less by legislation than by the magisterial edicts and the *responsa prudentium*. But in 437 A.D. the Byzantine emperor Theodosius II proceeded to carry out a codification of imperial law, since known as the Theodosian code, which was promulgated not only in the western empire but in the eastern as well. In 533 A.D. the emperor Justinian published the great code which has ever since borne his name. Both these codes integrated as positive law those portions of the older law which it was felt desirable to preserve. These codifications of Roman law at the dissolution of the empire were probably fortunate, but neither became accepted directly as the law of the invaders until the passage of many centuries.

In the sixth century, after the first wave of the barbarian invasions, the Roman subjects of the empire were allowed to live under their own law as far as their relations among themselves were concerned. This was perhaps the most important factor in keeping the Roman law alive, making intercourse with Byzantium possible and keeping more or less alive a knowledge of the Justinian compilations until the Roman schools in Italy began to flourish. Indeed, for the conquered Romans debased statements of Roman law were made which in time began to subvert the law of the barbarians. Examples of these

bodies of law are the edicts of the Ostrogothic kings, the *Lex romana burgundiorum*, the *Lex romana visigothorum*. The last, also known as the *Breviary of Alaric*, compiled in 506 by order of King Alaric II, consisted chiefly of extracts of the Theodosian code, and while in force only in Gaul and, until 642, in Visigothic Spain it was for centuries the chief source of Roman law in great parts of Gaul.

Probably to meet the competition of the written Roman law the Teutonic invaders proceeded at the same time to reduce their own laws to written form, the so-called *leges barbarorum*. Such codes of Visigothic, Salic, Frankish, Burgundian and Longobardic law date from the fifth, sixth and seventh centuries, but since they were already permeated with Roman law they can hardly be called barbarian laws. Although in the great Frankish empire which extended over the greater portion of western Europe there was a rebirth under the Carolingians of the essential notions of public law, which seemed to have disappeared completely with the decline of the Roman Empire, the application of law remained personal and local. Indeed, under the Franks grew up that regime of the personality of laws which was so prominent in the early Middle Ages. While this idea of the individual being entitled to his own law may have theoretically permitted along with the Roman law a parallel development of national systems of law, so that a barbarian law, particularly a Germanic law, could arise, first to compete with the Roman law and then to fuse with it, actually no such process was likely to take place. The *leges barbarorum* themselves were actually written in Latin. Even in the important *Lex salica*, the most purely barbarian document, characteristically primitive procedures can be found, such as tables of penal rates existing side by side with the private vengeance so widespread among all peoples at this stage of development, as well as some institutions of private law which are nowhere to be discovered among the ancient Germans. Other of the *leges barbarorum* are certainly not codifications of ancient popular customs. Indeed, the greatest code of Visigothic Spain, which took form in the seventh century, was a compound of Roman, Gothic and canon law elements and governed the whole population until the coming of the Moors. This code came to be known as the *Forum judicum* or the *Fuero juzgo* (the law of the judges).

Yet, despite the regime of personal law, it was in the Frankish empire that the peoples of this

time came closest to developing a coherent system of national law. New law was being created by imperial capitularies, and a system of imperial courts to which appeals were running was acting as a unifying and centralizing influence. It was the absence of central royal courts and a process of continuous legislation which made the legal systems of this period so unsatisfactory and explains the eagerness for the books containing the system of Roman law. Had the empire of Charlemagne not collapsed, the legal history of western Europe would have taken an altogether different course. As it was, even the *leges barbarorum* became inapplicable as the tribes merged and lost their separate identities. A period of local jurisdiction was inaugurated, and the population of Europe began to live by local customary law. Due to the necessities of feudalism, each body of customary law became uniform at least within its region, and the regime of the personality of law yielded to that of the territoriality of law.

The Ostrogoth kings of Italy ruled their subjects with Roman law. The laws of the Lombards became more and more Romanized and Christianized. Thus in northern Italy the law was preponderantly Teutonic while in central and southern Italy it was preponderantly Roman. The same was true in France where the south was known as the *pays du droit écrit* and followed Roman law, and the north was known as the *pays du droit coutumier* and lived by a new local law. However, the Roman law served to fill the gaps in the customs. The customary law under which mediaeval Germany lived was born and developed on Frankish soil. By the thirteenth century many of the bodies of customary law compounded of various elements were put into written form either by private compilers or upon royal command. Among the most celebrated of these customs are the *Coutumiers de Normandie*, the *Établissements de St. Louis* and the *Coutumes de Beauvoisis* in France and the *Sachsenspiegel* and *Schwaben-spiegel* in Germany.

Several unifying influences in the law of mediaeval Europe must, however, be taken into account. These were feudal law and canon law. While the former tended to integrate the law within the limits of each territorial state, the latter tended to give it universal validity. Feudal law took its place beside civil law because it dealt with the relations prevailing between members of groups (suzerain and vassals) and with the conditions of tenure. But since the

feudal system flourished free from admixture with previously existing laws and feudal laws very seldom became incorporated into statutes, when the feudal system finally broke up it left traces merely in the economic system. The fiefs, manors and other tenures were gradually assimilated to the law governing the divided domain. The feudal land concepts of *dominium eminens*, or eminent domain (the political and economic right of a feudal superior in land not under his direct and immediate control), and of *dominium utile*, or beneficial ownership, were modified and received into the civil law by the Romanists of the thirteenth century. The feudal law was substantially uniform, despite the lack of central judicial or legislative organs, due to the force of similar underlying conditions leading to the evolution of the *Libri feudorum*, a code of feudal law that became authoritative in many parts of Europe. In the final analysis, however, it cannot be said that feudal law was of significance in organizing a land holding system destined to be supplanted.

The canon law, on the contrary, played a far more important and permanent part in the evolution of the civil law. It supplemented and enriched the civil law with conceptions lost during the early Middle Ages and thus served as a link between Roman and modern law. Apart from its revival of true concepts of public law the canon law made great contributions to the development of family law, which was organized as a corollary of the Christian sacrament of marriage, much as among the Romans it had been made to depend upon the ideas of the *patria potestas* and the *justae nuptiae*. Furthermore, the canon law stimulated the development of the law of contracts and obligations, impregnating it with the ideas of equity and good faith; and to the influence of the canon law must also be attributed the creation of a coherent rational system of procedure. With the decline of the canon law the civil law fell heir to great portions of modernized Roman law.

Moreover, with the growing importance of commerce at the end of the Middle Ages it became evident that seigniorial customs and institutions were juridically incapable of coping with the situation. Thus a new field was opened for the civil law. Municipal charters and statutes laid the rudimentary basis of what was to become a *jus mercatorium*. But it was again the Roman law which provided the necessary variety of contracts and agreements, from which new types could be created. The system of com-

mercial law which was developed was not, however, absorbed as part of the general civil law as in common law countries. It was treated rather as a separate branch of law and stated in special codes of commerce.

Under the impetus of the new integrating forces in the life of Europe the civil law reached the height of its development in the twelfth century when the law books of Justinian, which had hitherto been in force only in the Byzantine Empire, were received in the west. Their acceptance was assured by the work of the great schools of law in Italy, of which the most famous and important was the school of Bologna. These schools reworked the whole body of Justinian legislation with the exception of the Greek *Novellae*, and the compilation of Justinian became the generally accepted *Corpus juris civilis*. The first school that arose was that of the glossators (*g.r.*). They looked upon the Roman law as the civil law par excellence, almost as a kind of revealed law. Their work culminated in the great gloss of Accursius. By their exegetical method they sought to establish the pure Roman law and make it applicable to their own time. But unfortunately they regarded their jurisprudence as universal and permanent when in fact it did not fit the needs of mediaeval life. The school of the glossators was followed by that of the commentators (*g.r.*), whose greatest exponent was Bartolus. They sought by a dialectic method to meet the needs of their own time, but soon they too fell into a subtle and sterile scholasticism. It was not until the rise of humanism that a new historical school of jurists began to study the texts simply as philological and historical documents against their real classical background. Theirs was a protracted labor, which in the course of four centuries was to succeed in making the Roman law the common law of Europe.

The vogue of the Roman law as expounded in the schools was so great in mediaeval Europe that its influence was even felt for a time in England. Vacarius came to England from Bologna in 1149 to teach it but was forbidden to do so by King Stephen. A writ of 1234 forbade that it be taught in London. Nevertheless, numerous traces of it can be found in the common law. Bracton's famous treatise on the laws and customs of England written about 1236 exhibits a great deal of Romanic learning. Chairs of civil law existed in both Oxford and Cambridge, and the "civilians" left their mark upon the practise of the ecclesiastical courts, the

admiralty and the chancery. In the sixteenth century conceptions from the Roman law helped to remold the common law in accordance with the needs of a modern state. The existence of a centralized system of courts ready to deal with controversies according to established methods made possible, however, the assimilation of alien materials in accordance with the native system.

But the work of the schools of Roman law made all but inevitable its general reception in all but the remote continental countries. In Italy, the home of the schools, the result was never in doubt. Yet paradoxically the Roman law was often officially repudiated precisely where its influence on institutions and customs was greatest. As a result of the claim of the German emperors to extend their authority over all territories where Roman law prevailed its teaching was forbidden in Paris from 1219 to 1679. Nevertheless, it may be said generally that the Roman law was nowhere more completely naturalized than in France. At first common usage had filled in the gaps in the territorial laws, copying completely whole sections of Roman law, but beginning with the end of the thirteenth century attempts at a fusion of these sources became evident. It was the jurists who, not capable of openly appealing to Roman law, undertook this synthesis. Thus customs were modified so much in the direction of Roman law that the latter as well as the customs conforming to it were named *droit commune*; while those which were contrary to it were named *droit haineux*, meaning that they were incapable of being extended by analogy. At the time of the official redaction of the customs certain commentators did not let slip by the opportunity of introducing as much civil law as possible.

During this period the term civil law was used more and more specifically to designate private law. By the seventeenth century under Cartesian and classical influences the law gained in clarity and precision. Along with the usual commentaries the jurist Domat offered a synthesis of the law in the guise of abstract, purely rational regulations actually derived from Roman law and applicable to private law (*les lois civiles dans leur ordre naturel*) as well as to public law, constituting perfect types of the juridic conceptions prevailing at the time of Louis XIV. Others, for instance Claude de Ferrière, and Pothier in his *Pandectae*, busied themselves with a methodical study of the content of Roman law, enabling its

utilizable portions to become incorporated into French law. The other works of Pothier definitely brought about the fusion of that which was best in custom and in the Roman law. His treatises on obligation, property, servitude, etc. seem to be based exclusively upon Roman law. The edict of St. Germain in 1679 made this possible by ordering the teaching of the civil law and by creating, parallel with it, instruction in French law. Royal legislation full of the same spirit carried on the work of codification—the *grandes ordonnances*, or codes, of Louis XIV concerning civil procedure (1667), criminal procedure (1670), waters and forests (1669), commerce (1673) and maritime law (1681); and those of Louis XV concerning gifts (1731), wills (1735), entails (1747).

In Spain, despite a certain disposition adverse to the Roman law in favor of the indigenous law, which was partly derived from it, the Roman law made itself felt, if not in all the local *fueros* at least in the common codes, as, for instance, the ancient *Fuero juzgo*. The Roman law triumphed definitely in the great code of Alfonso X of Castile, called the *Siete partidas*, a restatement of Romano-canonical law which took form between 1256 and 1265. It was promulgated by the *Ordenamiento d'Alcala* of 1348 as subsidiary law in cases where the local or royal *fueros* were insufficient. The history of the development of the civil law in the Iberian peninsula is as yet little known. But on the whole the codes or collections of later law both in Spain and Portugal, i.e. the Spanish *Ordenanzas reales de Castilla* (1484), *Leyes de Toro* (1505), *Nueva recopilación* (1567), and the Portuguese *Ordenações alfonquinas* (1456), *Manuelinas* (1514) and *Filipinas* (1603), confirm the view that Spanish juridical institutions drew their inspiration from Roman law.

The reception of Roman law was delayed in Germany until the fifteenth century, when it was finally adopted as the general subsidiary law. The causes of the reception may be said to have been the inadequacy of the existing judicial system, the influence of the learned jurists who came to displace the lay judges in the courts and the theory of continuous empire which fitted in with the political aspirations of the times. The law of Justinian, already theoretically the legislation of the Holy Roman Empire, was received *in complexu* as the common law of all its dependencies. The imperial chamber of justice (*Reichskammergericht*), created in 1495, thus accepted only the Roman-canonical procedure,

the decrees of the emperors and the *Corpus juris civilis* solely according to its interpretation by the Bartolists. The civil law was accorded primary authority, and the municipal and national statutes which in principle should have been given the preference were interpreted as strict law, not extending beyond the cases expressly under their terms, the burden of proof being put upon whomsoever relied upon them. This law extracted from the gloss, interspersed with elements of custom, with commentaries made by German jurists, called variously *Usus modernus pandectarum*, *Heutiges römisches Recht*, *Pandektenrecht*, was far removed from the law of Justinian. The influence of the historical school, however, did a great deal to elucidate and reject the incoherent elements in the law. Attempts were also made to remedy the situation by codes such as the Bavarian codes of 1616 and of 1756, based upon Roman law, the code of Joseph II completed in 1811 and the Austrian *Codex thesauricus*, which, however, was never applied. In Prussia Frederick the Great ordered the compilation of a code which was later to have great influence in Germany, the *Allgemeine Landrecht* finally completed in 1794. By the nineteenth century German philosophy and nationalism brought about a reaction. Romanists and Germanists were in conflict. But Savigny and his disciples, by pointing out the difference between the pure Roman law and the *Pandektenrecht*, hastened the coming of the codes which they opposed.

It was the nineteenth century which marked an era of codification (*q.v.*) in the civil law. Already begun in some countries it assumed during the French Revolution a new importance and significance. Louis XI had dreamed of a code based on custom; Henri III had caused the preparation of a code of the law contained in the *ordonnances*. Since Dumoulin the jurists had labored to establish a common law based on usages. In the time of Louis XIV Lamoignon had drawn up a project for a civil code which came to naught; it was the celebrated *Arêtés*, of which the *ordonnances* of Louis XV were a fragmentary realization. But in 1791 the Constituent Assembly decreed that "there shall be made a code of civil laws common to all the realm." After many attempts emerged the famous *Code civil* (*q.v.*) in 1804, at various periods also called the *Code Napoléon*.

The *Code civil*, expounded by a series of remarkable commentators, opened an era of codification in France. The *Code de procédure*

civile appeared in 1807, *Code de commerce* in 1808, *Code d'instruction criminelle* and *Code pénal* in 1811, *Code forestier* in 1827; an attempt is now being made to supplement these by a *Code du travail* and a *Code rural*. The *Code civil* has also been more imitated in other countries than any other legislative work since the Roman laws, upon which, indeed, it is partly based. Troplong called it the common law of the nations and Thiers the law of civilized nations. Many regions of Europe which then formed parts of the French Empire accepted it almost as soon as it appeared, either in its original form or closely copied. Such countries as Holland, Poland and Rumania owe much to it. Egypt has been for half a century a country of French law, which constitutes the common law of foreigners in the valley of the Nile. But particularly countries of Latin civilization have yielded to its influence; the codes of Belgium, Italy, Spain and Portugal derive from it. The Latin American countries of the New World have based their jurisprudence upon it. The province of Quebec has naturally adopted many of its provisions. In the United States Louisiana provided herself after 1825 with a civil code very closely resembling that of France.

The Germanic countries at first drew in large part from French codes. The *Code civil* was in force in Westphalia, Hanover, Frankfurt and Nassau during the Napoleonic era, and a modification of it was retained in Baden under the title of *Badisches Landrecht*. The Saxon Civil Code (1863), the Prussian law of bankruptcy (1855) and the Code of Commerce (1861) adopted by all the German states in 1866 were later models of French codes. But with the renaissance of jurisprudence in Germany under the empire appeared more original German codes. After many years of discussion among German jurists there was finally created the *bürgerliches Gesetzbuch*, or German Civil Code (*q.v.*), of August 18, 1896, put into effect on January 1, 1900. It represents an attempt at a scientific code based upon logical categories. After its introduction the German civil code competed with the French code for adoption in other countries. It influenced revisions or drafting of codes in whole or in part in Switzerland, Greece, Turkey and Japan. The Japanese civil code of 1896, especially, is drawn upon the model of the German civil code. The French and German civil codes, while resembling each other in their arrangement, differ doctrinally in many respects.

Scholars have often lamented the absence of any general history of European law. For, however diverse particular rules of law may be in different European countries, the civil law is a system with common characteristics and an autonomous spirit. With its rival, the common law, it is one of the two great legal systems which have competed for juristic supremacy all over the world. The great codifications of the nineteenth century may be said to express the maturity of the civil law as a system. Codification itself was in harmony with its spirit. Deriving from the Roman law, which in its final shape had been reduced to written form and given imperial sanction, the civil law lent itself readily to authoritative restatement. Developing under political conditions which made for disunity, in order to continue to exist it had to become itself a bond of unity. In the absence of central court systems it could appeal less to authority than to reason, and thus it became a law of the books. Its strength has thus lain in the logical development of general concepts, and philosophy has always played a great part in its continuous development—for instance, the idea of natural law and of equity and the idea of the individual will as the basis of all legal transactions. Especially has the civil law placed greater reliance upon the activity of the jurist than of the judge. Quite naturally therefore decisions in civil law countries have had no direct force as precedents, being regarded at the most as persuasive. The legislator, not the judge, has been regarded as the creator of new law. Politically the civil law, developing under the absolutist traditions of monarchy and empire, has tended to encourage the supremacy of the legislative and administrative rather than the judicial organs of the state, and no doctrine of the "rule of law" has entered into the legal system as a guaranty of individual freedom. The state has tended thus to maintain a position of supreme competence.

But certain new tendencies are now appearing in the civil law. Despite the theory of the primacy of the state with its corollary that all law emanates from the general will, jurists have admitted such a multiplicity of legal sources, consisting not only of written law and custom but of case law and doctrinal authorities, that uncertainty and arbitrariness have been introduced into the objective legal order. The result has been a growing movement in favor of giving obligatory force to judicial precedents. On the other hand, as a result of German

influence, there has appeared a prejudice in favor of applying the geometric method to juridic technique and especially to the codifications. Treated in this way the latter have ceased to be regarded as literary texts and they take on the scientific appearance of axioms and theorems. Thus, as a result of an excess of logic, difficulties have begun to impede the acceptance of jurisprudential sources at a time when they should preponderate. Closely connected with this has been the revival of a certain formalism in the substantive law, intended to permit the more rapid consummation of legal transactions. This is contrary, however, to the individualism of the civil law.

Indeed, the civil law is undergoing a marked transformation in the direction of socialization. In their demagogic character the changes in the codes generally approach the imperial constitutions of the Byzantine Empire, tending to bring into existence a law of classes. They are the result of socialist doctrines impregnating the minds of legislators with a romanticism hostile to an objective moral and juridical order. Due to the rupture of the ideal of juridic equality these socializing laws often have antisocial effects. There is an increase everywhere in the types of laws to the advantage of the state and the masses but to the detriment of the individual. Civil law in the sense of private law is in danger of disappearing. Private legal transactions, because of their socialization, are on the verge of being absorbed into public law.

CIVIL LIBERTIES. Civil liberty is a concept, basic to modern political thought, which in its most general usage connotes the freedom of the individual with respect to personal action, the possession and use of property, religious belief and worship and the expression of opinion. This freedom is conceived to imply a right to protection against both governmental and private interference, but it is essentially a right of the individual as against the authoritarian state.

The despotisms of the ancient world, in which an absolute ruler exercised unrestricted power over the lives, property and actions of his subjects, had no room for the concept of civil liberty. Even under the sophisticated governmental systems of the Greeks and Romans the concept was unknown. Greek democracy at its height and Greek political philosophy as expounded by Plato and Aristotle subordinated the individual to the state. The state did not exist for the citizen but the citizen for the state. For its good no sacrifice imposed on the individual was too great. And while the Greek democracy endowed citizens with a wide measure of political control by placing ultimate governmental power in their hands, it accorded the individual no civil liberty beyond the reach of that power. In like manner the Romans ap-

proached at times a political democracy. But the power thus popularly exercised knew no limits set up by any concept of individual right or civil liberty.

Nor could a conception of individual liberty find place in a feudal society, where the important rights, duties and obligations were those mutually obtaining between lord and vassal and where the social order was essentially founded on contract. Liberty could mean only immunity from burdens or duties, but as such it could frequently be secured by barter or purchase. The development within the feudal system of the technique of bargain and contract undoubtedly influenced to some extent the methods by which civil liberty was later secured.

Civil liberty is essentially a modern concept, closely allied ideologically with the philosophies of individualism and liberalism, intimately bound up in its development with the circumstances of the growth of the middle class and its economic and social dominance. Two forces at work during the Middle Ages helped lay the foundation for this development. Christianity emphasized the doctrine that the citizen himself might have duties and obligations higher than those imposed by temporal rulers and thus created a philosophy which could regard resistance to constituted authority in certain cases as an act of piety rather than of heresy. Thus it prepared the way for the development of a natural rights philosophy. Secondly, the growth of the national state, with an area so large and interests so heterogeneous that resort to the principle of political representation was inevitable, emphasized the fact that the individual citizen was a person distinct and apart from the state and with interests and privileges of his own.

The struggle for civil liberties began in England as a phase of the struggle of the feudal lords to maintain a degree of autonomy in the face of encroaching centralization; it became bound up with the fight for representative government, and the privileges and rights won by limited groups were gradually extended in their application to all classes within the nation. In this generalized form the idea of civil liberty became embodied in doctrine and spread to other countries. Most important for the influence of the doctrine was the fact that the principles of civil liberty were embodied in documents which later provided the rallying cries so necessary to the cause of civil liberty propaganda.

The earliest and most notable of these documentary statements of English civil liberty was

Magna Carta. Wrung from John by the barons of the realm in 1215 it did not purport to set up new rights but was rather a statement of the existence of certain rights, mainly those of the feudal nobility. It pledged the king to refrain from certain clearly arbitrary acts; it forbade the sale of justice; and it provided that no man should be deprived of his property, imprisoned or banished save by the legal judgment of his peers and the law of the land.

The meager list of civil liberties protected by Magna Carta was enlarged by the Petition of Right reluctantly signed by Charles I in 1628 at one of the crises of his long struggle with Parliament. This also was limited in the scope of its guaranties to the actual liberties which had been infringed. It proscribed the billeting of soldiers upon the people, the trial of offenders by martial law, the collection of loans or taxes not sanctioned by Parliament and the imprisonment of any person without specific charge and orderly trial. It purported not to create new rights but merely to reaffirm existing rights which must not be violated.

A third great charter of English civil liberty emerged from the Revolution of 1688. The conditions under which William and Mary ascended the throne of the deposed James II were embodied in the Bill of Rights of 1689. Its most important provisions were the denial of royal authority to dispense with any law; the affirmation of the right to petition the crown with impunity; the forbidding of standing armies in time of peace without parliamentary consent; the declaration that elections to Parliament must be free from royal control or influence, that such elections must occur frequently and that the members of Parliament must have complete freedom of speech and debate in that body; and the denunciation of excessive bail in criminal cases. It was out of such specific provisions that the general doctrine of civil liberties developed.

During this very period the colonization of America gave a new force to the growth of civil liberties. The atmosphere of the new world was congenial to the preservation and enlargement of civil liberty. Many of the colonists came protected by charters or definite contracts, to which they could appeal as defense against arbitrary or oppressive measures. The British policy of making the colonies financially self-supporting, raising by local taxation the cost of administration as well as of colonial defense, contributed to this end. For the financial control thus resting in the elected representative assemblies enabled the

colonies to bargain with royal governors and agents and to secure a measure of autonomy which exceeded in its generous proportions the orthodox "rights of Englishmen." By custom, by prescription, by bargain and acquiescence, the range of civil liberty grew apace and, when under a changed administration and a sterner policy the mother country sought to regain in the colonies the measure of control which English statesmen urged had never been lost, revolution burst forth. Thus the struggle for individual liberty connected itself with a struggle for national autonomy. This struggle was defended by a philosophy so compelling and embodied in a document so conspicuous that its influence in the world wide spread of civil liberty can hardly be exaggerated.

The philosophy of natural rights thus given prominence in the Declaration of Independence was an old doctrine. But when a philosophical defense was needed for the Revolution of 1688 it had been elaborated and given new form by John Locke with a cogency and skill which made it the basis for the political philosophy of succeeding centuries. The theory postulated the existence of an original state of nature in which all men were entirely free; government arose through the necessity of restraints upon freedom of action involved in community life and was based upon contract amongst the members of society. By this social compact certain rights, natural and inalienable, are forever reserved to the individual. All government rests on popular consent, and when government invades the natural rights of the individual the people are fully justified in overthrowing it and replacing it by one which will properly safeguard civil liberty.

It was the flexibility of this doctrine which made it so serviceable to the colonists in 1776 and so generally useful in developing the range of civil liberties. For the number of particular rights regarded by popular consensus as natural rights could always be enlarged, and in the course of time new rights or immunities have come to be deemed fundamental. The Declaration of Independence and the bills of rights of the various state constitutions of the United States contained lists of rights much broader than those in the three English charters of liberty. The Constitution of the United States, however, established as it was under the influence of a conservative reaction against the more radical leadership and philosophy of the revolution, did not originally contain any statement of

the civil liberties of the individual beyond the meager protection against bills of attainder, ex post facto laws, punishment for constructive treason and laws impairing the obligation of contracts, and the assurance of jury trial in criminal cases. And when political expediency made the addition of a formal bill of rights desirable the list of guaranties comprising our first ten amendments contained few if any more than the recognized civil liberties of the Englishmen of that day.

In embodying their guaranties of liberty in written constitutions which could be changed only by the difficult procedure of constitutional amendment the American statesmen of the eighteenth century made an important contribution to the technique of protecting civil liberties against encroachment. The peculiar development in the United States of the doctrine of judicial review gave the courts the final decision as to the scope of civil liberty. Through that power to invalidate legislative acts deemed to be unconstitutional they could virtually define natural rights and liberties. In the due process clause of the Fourteenth Amendment, which eventuated from the struggle to abolish slavery and secure civil liberties to the Negro, the courts found a new and most effective device for the extension of their power. It is a device which can work, however, toward the restriction as well as the extension of the scope of civil liberties, depending upon the opinions of the members of the court. No other technique, however, has proved more effective in safeguarding the accepted civil liberties.

Democracy does not guarantee the maintenance of any group of liberties for the individual. A government founded upon the doctrine of majority rule must show unremitting care and self-restraint if that majority is to respect at all times the civil liberties of the minority. Within recent years there has been a clear tendency, especially in the United States, to a relaxation in the interest in civil liberty and a loss of many specific rights. The increasing governmental control necessitated by the complexities of modern social and industrial life results in continuous encroachments upon rights fundamental to the older philosophy of individualism. Under the guise of protecting health, morals and safety the majority has found opportunity to write into law its views of morality, decorum, religion and political orthodoxy in such a way as frequently to impair the civil liberty of the individual. The unintelligent

censorship of books, plays and moving pictures; the prohibition of the teaching of evolution and other unpalatable doctrines in the public schools; the breaking up of meetings held to expound unpopular political beliefs; the exclusion from the country under the immigration laws of European political offenders and the denial of citizenship to pacifists under the naturalization laws—all are outstanding examples of violations of once generally recognized individual rights.

The course of the labor movement in the United States has been largely influenced by the necessary struggle of American labor against similar violations. As a result of its policy of non-political action and reliance on the strike and boycott it is peculiarly liable to assault from this side. In numerous strikes in recent years the rights of assembly and free speech for the strikers and their representatives have been suppressed in most flagrant violation of the doctrine of civil rights. The use of the injunction and the yellow dog contract have also frequently resulted in abrogations of civil liberties.

The presence of the American Negro has always been a challenge to respect for civil liberty in the United States. Under the judicial theory that segregation is no denial of equality he is segregated on common carriers and in public places. He is subject to racial discrimination exercised by private persons. His civil rights are impaired, when they are impaired, not so much by discriminatory laws as by the unequal administration of laws nominally fair. All too often complete breakdown of governmental protection results in a lynching.

One of the heaviest prices paid by the United States, and indeed by many other countries, for the World War was the decline in popular regard for civil liberty. War always means a restriction upon individual freedom of action. But the repression of freedom of opinion, utterance and press under federal and state sedition laws in the United States and similar laws in other countries went in many instances far beyond military necessity or the demands of national safety. In the United States the state laws for the repression of sedition, syndicalism and anarchy which followed upon the cessation of the war, while legitimately applicable to genuine dangers to peace and order, are so broadly drawn and have been so generously interpreted that most of the revolutionary leaders of 1776 could be sent to jail for long terms under their provisions. At the same time there have sprung up organizations

for the promotion of patriotism which devote money and energy to the attacking and suppressing of unconventional and unpopular political and economic views. These attacks on specific civil liberties have been accompanied by a lessening of faith in the doctrine of civil liberty itself. To counteract such onslaughts various organizations have sprung up. Most important is the American Civil Liberties Union, which attempts to extend legal and financial aid to persons whose liberties it believes are being invaded. Its work undoubtedly helps to fortify the belief in the social importance of the maintenance of civil liberties as well as to right specific injustices. Somewhat similar organizations exist in France and Germany.

In Europe civil liberties have been successively attained and lost. During the late Middle Ages various rights and privileges, virtual liberties of the individual, were acquired by the citizens of many towns and cities. But the rapid centralization of governmental power prevented the working out of these tendencies. Many of the German principalities of the eighteenth century developed both a philosophy and a tradition of individual liberty, but for Europe as a whole it was not until the French Revolution that civil liberty became an important issue. The Declaration of the Rights of Man of 1789 embodied the natural rights philosophy and avowed the equality of man, the political rights of the citizen, freedom of religion and utterance, protection from arbitrary arrest and imprisonment, and taxation only by representatives of the people for known purposes. But under the Napoleonic dictatorship these civil liberties were largely lost. The very theory of natural rights was in abeyance. It was kept alive, however, by radical and dissatisfied groups in France, Germany, Austria and Italy, and with the revolutions of 1848 it came again to the front. While none of these revolutions achieved permanent reforms they kept alive the spirit of liberty and laid the foundations for more substantial and lasting achievements in the future.

Until the period of constitutional upheaval which followed upon the World War the protection of civil liberties in European countries rested in general upon sound tradition and practice rather than upon enforceable guaranties. Thus there is no bill of rights in the constitution which established the French Republic in 1875. In contrast all the post-war constitutions contain bills of rights, copied more or less freely from that of the United States constitution. These

guaranties of civil liberty are frequently a bit elusive, being coupled with exceptions and provisos which rob them of most of their effectiveness. In the main they are protections against executive rather than legislative interference with individual rights, and when they do purport to restrict the law making bodies they are not mandatory in nature, since the American concept of constitutional provisions judicially enforceable against the legislature did not find a place in the new constitutions of Europe.

In the Far East the concept of civil liberty has made but small headway. It is too foreign to the fundamental political assumptions of oriental philosophy to be easily or fully assimilated. Certain of the specific substantive or procedural rights common in western countries have been adopted by the modernized oriental governments, but the ways of thought of the peoples have been but superficially affected. Thus Japan has been a constitutional monarchy since 1889 and at present enjoys complete religious freedom; jury trial was introduced in 1928. Although China has been a republic since 1911, the successive revolutions and wars have provided little opportunity for the spread of individual liberties.

This spread of some of the incidentals of civil liberty but heightens the significance of the attacks upon the fundamental basis of the doctrine. Since the World War two distinct systems and philosophies of government frankly inimical to the postulates of civil liberty have emerged. The one, communism, subordinates all rights and interests, economic, civil, political, to the welfare of the communistic state. The citizen, as in Plato's Republic, is but a means to an end. He has no rights which can be asserted against the state but must achieve his development through the common welfare. Fascism, although it stands, in contrast, for the maintenance of private property and the abolition of class struggles, is also based on a conception in which the individual has no rights as against the state.

Communism and Fascism are but extreme illustrations of the modern collectivist tendency. The same trend is manifested in the widespread attempts to strengthen the legal and political status of groups and associations, to the general interests and welfare of which the rights and liberties of the group members are often ruthlessly sacrificed. Such groups—labor unions, trade associations, churches—are attempting to secure for themselves, as against the political

state, rights similar in effect to those which the individual gained over the course of centuries and enjoyed in most complete form during the nineteenth century. Whether those individual civil liberties can be adapted to the forms of a pluralistic state and an increasingly complex and interrelated social and economic order is one of the major problems of modern political theory and modern statecraft.

CIVIL LIST. See MONARCHY.

CIVIL RIGHTS. The term "civil rights" is sometimes used by the courts in the broad sense of rights enjoyed and protected under positive municipal law in contrast with so-called "inherent rights" vesting in the individual by virtue of a supposed "natural law"; more frequently it is used in the United States in a narrower technical sense acquired in constitutional discussion concerning the legal rights of free Negroes in the years before and immediately following the Civil War. It was often coupled by way of contrast with the term "political rights," as by Kent: "In no part of the [United States] do [free colored persons of African blood] in point of fact participate equally with the whites in the exercise of civil and political rights" (*Com-*

mentaries, 3rd ed., 1836, vol. ii, p. 257, note). The distinction between these two classes of rights was suggested in an early case where, in dissenting from a decision that the right to vote and hold office was essential to citizenship, one of the judges, expressing the view which later came to prevail, said that the mistake arose "from not attending to a sensible distinction between political and civil rights" [Amy v. Smith, 11 Kentucky 327 (1822)]. Such a distinction was doubtless facilitated by the habit of contrasting civil and political "liberty," which dates back at least to Christian's edition of Blackstone (1803): "No ideas or definitions are more distinguishable than those of civil and political liberty; yet they are generally confounded. . . . Civil liberty . . . is nothing more than the impartial administration of equal and expedient laws . . ." (Blackstone's *Commentaries*, vol. i p. 127, note). Blackstone used the term "civil privileges" to describe the private rights protected by municipal law and reduced these to "three principal or primary articles; the right of personal security, the right of personal liberty, and the right of private property" (*ibid.*, vol. i, p. 129). The term was also used in the constitution of the American Anti-Slavery Society (1833), which demanded equality of "civil privileges" for whites and blacks (MacDonald, William, *Select Documents of United States History, 1770-1861*, p. 305). The term "civil rights" came to be used to describe the legal rights and immunities which were enjoyed by white persons under municipal law of the various states but which were often denied in whole or in part to free blacks. In Mississippi, for example, it was held in 1859 that "free negroes or persons of color . . . here in violation of our laws and policy, are entitled to no such rights. They are to be regarded as alien enemies or strangers *prohibiti*, and without the pale of civility, and incapable of acquiring or maintaining rights of property in this State" [Heirn v. Bridault, 37 Miss. 209 (1859)]. In Georgia free Negroes were permitted to acquire and hold real estate except in certain cities, but it was declared by the courts that "the African, in Georgia whether bond or free . . . has no civil, social or political rights or capacity whatsoever, except such as are bestowed on him by statute" [Bryan v. Watson, 20 Ga. 480 (1856)].

In the interval between the Thirteenth and Fourteenth Amendments Congress passed the first of the so-called Civil Rights Acts (1866),

which undertook to confer federal (in distinction from state) citizenship on all persons born in the United States and not subject to any foreign power, excluding Indians not taxed, and provided that the classes thus made citizens should thereafter in all the states have the right to make and enforce contracts, to sue and be sued and give evidence, to inherit, purchase, hold and sell real and personal property; should have "full and equal benefit of all laws and proceedings for the security of person and property as is enjoyed by white citizens"; and be subject to no other or greater punishments than white citizens. It was made a federal crime for any person, acting under state legislation, to deprive any citizen of any of the rights thus guaranteed him. The act was passed over the veto of President Johnson, who expressed the opinion that it was an attempt to invade the sphere of exclusive state action unwarranted by any provision of the constitution. To remove such doubts the Fourteenth Amendment made all persons born in the United States citizens not merely of the United States but also of the state where they reside, and provided that no state should abridge the privileges and immunities of citizens of the United States or deny to any person within its jurisdiction the equal protection of the laws. Congress was given power to enforce the amendment by appropriate legislation, and under this authority the provisions of the act of 1866 were substantially reenacted by the second Civil Rights Act (1870). The Supreme Court has said that "the words of the [Fourteenth] amendment, . . . contain a necessary implication of a right, most valuable to the colored race—the right to exemption from unfriendly legislation against them distinctively as colored—exemption from legal discriminations implying inferiority in civil society, lessening the security of their enjoyment of the rights which others enjoy" [Strauder v. West Virginia, 100 U. S. 303 (1879)]. Therefore a conviction under state court procedure which restricts jury service to white men is void (*ibid.*); and Congress may make it a federal offense for a state official, either in pursuance of a state statute or otherwise, to discriminate against Negroes in the selection of jurors [*Ex parte Virginia*, 100 U. S. 339 (1879)].

But it is only direct discriminatory action by states or discrimination incident to the exercise of their authority that the amendment prohibits; and therefore those provisions of the third Civil Rights Act of 1875 which made it a federal offense for innkeepers, carriers and proprietors

of places of public amusement to deny Negroes full and equal accommodations with white persons are unconstitutional [Civil Rights Cases, 109 U. S. 3 (1883)]. Further, state statutes requiring carriers to furnish separate and equal accommodations for white and colored passengers [Plessy v. Ferguson, 163 U. S. 537 (1896)] or establishing separate but equally well equipped schools for the children of the two races [U. S. v. Buntin, 10 Fed. 730 (1882)] are not unconstitutional as a denial of the equal protection of the laws, but are justified as a legitimate exercise of state police power under the doctrine of reasonable classification. In *Buchanan v. Warley* [245 U. S. 60 (1917)], however, a city ordinance which forbade colored persons to move into a city block in which a majority of the residents were white was held unconstitutional as depriving the owners of the right to dispose of their property to willing purchasers. The ordinance was said to transgress the legitimate limits of state police power because by basing the discrimination on color it was at variance with the obvious purpose of the Fourteenth Amendment. But since the amendment does not forbid discrimination by private action owners may lawfully covenant with one another not to sell their property to Negroes [Corrigan v. Buckley, 271 U. S. 323 (1926)]. Many state constitutions and statutes contain provisions against discriminations on account of color.

It was apparently thought by the framers of the act of 1866 and of the Fourteenth Amendment that the rights of holding property, making and enforcing contracts and the like were incidents of federal citizenship and would therefore fall within the purview not only of the "equal protection of the laws" clause of the amendment but also of the clause which forbids the states to abridge the privileges and immunities of citizens of the United States. The Supreme Court has rejected this view, holding that the "privileges and immunities of citizens of the United States"—i.e. those attaching to federal citizenship—include only such rights as "owe their existence to the federal government, its national character, its constitution, or its laws"—as the right to use the navigable waters of the United States, the right to protection abroad, the right of free access to the national capital and the right to become by residence a citizen of a state [Slaughter House Cases, 83 U. S. 36 (1872)]. They do not include such political rights as the right to vote [Minor v. Happersett, 88 U. S. 162 (1874)] nor such rights as the right to bear arms

contrary to the prohibition of a state statute [Presser v. Illinois, 116 U. S. 252 (1886)].

CIVIL SERVICE

HISTORY. The term civil service was used for the first time in 1854 when Sir Charles Trevelyan borrowed it from the British administration of India and applied it to English conditions. It included simply the professional body of officials employed by the state in non-military and non-judicial services. It is in this sense that the term is used here, although we must also exclude teachers, who are sometimes members of continental civil services. It should be observed that this definition is very broad and makes no specifications as to technical preparation (which might be none at all), methods of recruitment (which might be simple patronage) or social and political character. But it does establish the professional character of the service and consequently eliminates the ill defined group of unpaid public servants, lay, voluntary and enslaved, who in the past performed and still perform a considerable amount of work requested or commanded by the state. One of the great remaining problems to decide is at what point unprofessional officialdom should cease so as best to satisfy the need for technical efficiency and at the same time obtain the positive civic value of lay cooperation in government. It is only in comparatively recent times that the professional element has become the larger and now the vastly preponderating part of public administration.

There is little to be learned from the civil service history of ancient and classical states since detail is insufficient and untrustworthy.

But a broad general view reveals some interesting sociological facts. In ancient Egypt three factors determined the nature of the administration—the dependence upon wheat, the difficulty of transport and the nature of the Nile. The results were: a body of officials and scribes for the registry of land; a forced period of rest during inundations, when compulsory and unpaid service for the public works was feasible and directors of inundation were required; the splitting up of the country into small communities located at short intervals since none could be out of range of the nearest wheat reserves; and the establishment of judicial offices as well as directorships of houses, treasures, police, audit, wheat stores, desert land and the hunters. There was much unpaid and hereditary work, especially in the higher ranks. In the small cities the administration was a little more complicated.

Athens in her maturity knew no civil service in the modern sense, for as a result of her passion for democracy all offices, administrative as well as legislative and judicial, were elective for short terms and practically all citizens had the right to be nominated and elected thereto. This system was possible provided three conditions were satisfied: that men should be ready to serve the city although their standard of living be adversely affected; that the problems of administration should not require the mastery of a difficult technique; and that the city should be small enough to allow the administrators to plan, calculate, supervise and bring home their commands to the population.

Republican Rome exhibited much the same basic organization in its administration as did Athens and for similar reasons. But one observes the constant tendency to specialize functions by dividing the labor of different offices, this tendency being concomitant with the growth in civic activities. Then, as Rome's dominions extended, elective offices, especially those in foreign parts, were held for longer and longer periods. The empire could no longer support haphazard, amateur officialdom, and the chief classes of administrators, the census officials, the officials of the fiscus, the prefects of the city, the regulators of grain supply, the superintendents of the aqueducts, the public buildings and the sewers and the administrators of the local regions were appointed by the emperor. Radiating too from the emperors directly were the governments of the provinces with the governors at the head of each.

Under the mediaeval feudal system political authority was disintegrated and settled in small territories the chiefs of which, by a system of fiefs, owed allegiance to a central authority and in turn received support and fidelity from lesser vassals. Thus officialdom was concentrated around a number of poles represented by local lords, barons, *comtes*, *ducs*, *Grafen*, with the prince or king at the center—a point which did not become permanently fixed until revenue could be easily carried to it. The primitive state of communications and the absence of a monetary and credit system paralyzed the central authority, and the military, judicial and economic administration of a large territory could be based only upon the grant of land in return for service. Extreme decentralization set in, punctuated by violent anarchy and fitful attempts to vindicate central authority. The governors of districts and provinces, the peacetime successors of the original conquerors, acquired hereditary tenure, invented titles for themselves, became ennobled and thus established a class which monopolized office, often as a private hereditary property. Even in the modern services the hereditary title, the *adelig* cognomen, although legally divested of its privileges, still retains their traces in practise.

Administration was mixed: the same counselors at the center were concerned with military, financial and judicial affairs, while the private estate of the prince was indistinguishable from the state. This was possible as long as the volume of public work was small, that is, until the sixteenth century; war, treaties with foreigners, occasional courts of justice, the collection of revenues in their then curious form, were the main activities of the center, and in the localities occasional work upon the roads, drainage, house building. The former group of activities was carried on by the great lords whose ability or property made them indispensable, by learned churchmen who could afford to go without pay, by minor clerks in orders who could be paid in various forms by the church, by certain lay clerks whose numbers increased as education and wealth ceased to be the monopoly of the church, and by lawyers, who in France and Germany became after the "reception" especially skilled in Roman law and were employed to supply authority for the absolute prince now arising from the wreckage of the feudal system. Gradually exchequers and chancelleries assumed a separate and public form while a number of advisers and clerks clustered about

the privy councils of the crowns. In the localities the royal power was represented by such officers as the sheriff and the justice of the peace in England, the *missi dominici*, the *enquesteurs* and *gouverneurs* in France, the *Vîstume* and *Landeshauptmänner* in the Germanic states. These offices, comprising administrative, judicial and military functions, were originally at the royal pleasure and later tended to become hereditary or to die out except as forms. In the rural localities the principle of elective, unpaid, compulsory office prevailed; it was seen that the duty of attending to works of public utility rested somewhere, and in the peculiar communal environment of the Middle Ages the neighborhood theory of "take-it-in-turn" was institutionalized.

In addition to the feudal organization the Middle Ages were characterized by the gradual assumption of wide political powers by the towns. They were more active than the central authority or the small rural communities. Population thronged; regulation was necessary. That which the great state was to experience and do after the sixteenth century the towns experienced and did until that time. There was community based upon neighborhood, inter-town rivalry, a common religion, common industrial and commercial aims and organization managed by the guilds, as well as a compact area and population surveyable by the early statisticians and easily inspectable by a few men. Courts and officers were established by the municipal authority—inspectors, tax collectors, managers of almshouses, clerks—while the multifarious duties of industrial regulations and social welfare were carried on by the guilds and their officers. The higher decorative and directive officers were elected by the governing council of the municipality and the members of the guild, while the councils themselves appointed to the executive positions.

The church, ruling over wide territories, was the great model of hierarchy, discipline, specialization of functions and professional and corporate life. Until the sixteenth century and in some spheres for a long time afterward it administered vast fields of what are today state activities such as poor relief, education, law and order.

Under the absolute monarchies which succeeded feudalism the great states of the West evolved civil administrations to meet their peculiar requirements. In England the Norman conquest had established an invincible central authority, and the only remaining need was to

cover the country with local justices of the peace. These officials held royal commissions, but having been automatically designated for office by the localities of their birth and by their social connections they exercised their power with a generous regard to these factors. In the parishes the principle of unpaid office was in force; the minor officers of the town corporation were sometimes paid salaries which they supplemented with the gratuities of the age—*fees*, gifts and *pots-de-vin*. In the English county the offices of the quarter sessions were also subject to patronage. The central authority continued to divide itself into separate departments and to distinguish itself from the royal household—a process brought about by the increasing necessity for expertness, full time work and permanence, as the state undertook further and more complicated duties. Colonizing, commercial enterprise, the domestic administration of the mercantile system, poor relief, customs and excise, the postal monopoly, everywhere caused a large growth in what later came to be called the civil service and stimulated the development of its modern features. This growth marked the beginning of the golden age of patronage, which lasted until 1850. The recipients of this patronage were all above the lower middle class or hangers-on of more lowly birth. No one in England, until Burke in 1780, showed any real regard for “civil service reform” in its modern sense. The potent reformers of the time were kings and if they were otherwise preoccupied there was no reform.

In Prussia and France there were vigorous monarchs who ruled and caused great administrators to rule. Prussia under Friedrich Wilhelm I inaugurated a civil service the expertness of which was unparalleled during the succeeding century and a half. Competence proved by written and oral tests in prescribed subjects—the *Kameralwissenschaften*, a peculiar combination of economics and public administration—was a prerequisite for office, limiting the privileges of the nobility. Two factors contributed to this result. First, the continuous necessity for war organization and discipline, both in defense and in breaking down the Estates, caused a premium to be placed upon hierarchy, discipline, technical skill and rational organization. The *Kriegscommissariat* extending over the country was converted into a tax organization and then into a more comprehensive civil service. The spirit of the original military organization remained and was fostered. The second factor was the unusual

administrative ability of three Prussian kings, whose autocratic regimes fell within a single century and were characterized by unprecedented state activity, with the monarch regarding himself as the “first servant of the State.” The organization and the spirit of “bureaucracy” tided over the crises of 1789 and emerged into the nineteenth century.

France was delocalized by Richelieu, Louis XIV and Colbert. Their instruments were the Conseil d’État and the secretaries of state. But luxury and the pursuit of military glory ruined the administrative edifice they built; for, taxes being insufficient, offices were sold and the *vénalité des charges* caused the creation of a pluto-bureaucracy manned by the nobility and by the moneyed bourgeoisie, which could acquire a title upon the purchase of office. England’s decentralization, the self-government of the justices of the peace and the patronage system were the direct results of a longer experience of unchallengeable central government and of smaller need for national discipline due to immunity from attack. England’s bureaucracy flourished not at home but in India and the American colonies; and it was not until long afterward that the cries of an outraged population could be heard in the mother country to the extent that they were heard in France and Prussia.

Toward the end of the eighteenth century there set in those tendencies one aspect of which was represented by the French Revolution and another by the industrial revolution. “The career open to the talents” was proclaimed and came to mean “no privilege” in Europe and “rotation of office” and “spoils” in America. But these tendencies had a deeper significance. The idea of progress stimulated men to contrive an instrument of release from the conditions of their day; and the most potent was the machinery of government. It was soon discovered that parliaments were less competent servitors than civil servants. Two things were recognized. First, the necessity for a rational order in industrial effort and organization, for the utilization of all the elements most skilled to do the work required, regardless of their social position, religious beliefs, political party and (more recently) their sex, and for the exclusion from the administrative apparatus of all candidates with merely adventitious qualities. Economic rationalism has not entirely excluded other considerations but it has secured an almost complete triumph in the civil service. Second, it was

perceived that mastery of skill could be achieved only through exclusive devotion and that consequently division of labor was socially advantageous. Management or administration came to be considered a specialized vocational pursuit.

On the material side the industrial revolution compelled society to equip itself to meet new obligations on a vast scale. Health, poverty, education, communications, trade, agriculture, colonies, manufactures now disclosed elements which demanded large scale regulation and compulsion. The political philosophies of the utilitarian school, the Tory humanitarians and the socialists stimulated inquiry into these elements and brought about the adoption of necessary measures. At first only the dead environment—drains, buildings, factories, roads—was to be altered, but it soon began to be seen most vividly in the sphere of public health that men were no less important parts of one another's environment. There resulted a broad and deep extension of state activity involving of necessity an increase of civil servants. They furnish the expert knowledge without which parliaments cannot adequately create and enact policies, and when the laws are made the civil service carries them out. The experience of modern governments shows conclusively that the members of the representative assemblies have neither the time, the ability, the inclination nor the machinery to perform the former of these functions. Before they can enact policies they must come to the permanent officeholders for exact knowledge of the enormously complicated social life of our gigantic states. As to the second function, a variety of reasons forces parliaments to legislate in general terms and leave the civil servants to draw up rules and orders—to create "secondary legislation," the great and increasing mass of which gives the civil service in modern states a vast power.

Furthermore, great and formidable groups began to impinge upon one another, and seeking their own interests they threatened the peaceful continuance of the state. More and more, therefore, the civil service has come to be acclaimed as the indispensable umpire between the interests and as the embodiment of state consciousness as distinct from that of any party or group. It is the advocate of the common weal in addition to being the common servant. Hence the importance placed upon the political neutrality of the service and, where the form of the state is not yet secure, as in Germany, Russia or Italy, upon its specially sworn allegiance.

The most striking common feature of such state activities—or civil service activities—is their real or presumed social urgency. And because they are urgent they are not sold for directly paid prices but are given impartially to all citizens. Nor may an interruption in their supply be permitted. From the first fact arise the inability to measure exactly the "profits" of the public service and the need for public responsibility, involving tedious reference to laws and records, and consequently slowness; and from the second follow restrictions of the civic rights of civil servants.

MODERN CIVIL SERVICE. The main problems raised by modern civil services are recruitment; promotion; discipline (including incentives to work); pay; relations with the legislature and the public; and legal liability.

(1) Recruitment was the first concern of reformers. Broadly until about 1870 most countries recruited by the patronage system, political and social connections outweighing functional competence as qualifications for entry. But a striking and important exception to this was Prussian development where, since the end of the seventeenth century, merit as tested by definite academic excellence and practical experience made a great breach in the system of favoritism and purchase of office. Prussia has now over two hundred years experience of a specially qualified bureaucracy, compared with the brief half century of Great Britain, France and the United States. Great Britain began in 1853, the United States and France about 1880, to construct impersonal tests based upon defined schemes of educational preparation.

The essence of civil service recruitment is the education which its tests presuppose. Prussian development in this respect has had three great stages: before 1815, from 1815 to about 1879 and since 1879. In the first stage university education in the *Kameralwissenschaften* and practical experience in agriculture or business were required. In the second, practical experience was dropped and education became more and more confined to law, mainly private law. The justification offered was that great works of codification were being undertaken and a legal education was indispensable; and that to achieve the *Rechtsstaat* in a monarchy a training in law was more important than in any alternative subject. Both civil servants and judges had the same preliminary training and examinations; they then branched off into stages of apprentice-

ship and probation as *Regierungsreferendar* or *Justizreferendar*. The third stage came when it was discovered that this legal training was too narrow in scope and too rigid in form for the modern state. Between 1879 and 1909 progressive amendments were made. Economics and constitutional and administrative law were added and special attention was paid to training during the *Referendar* period. The full force of the complexities of modern society has been felt only since 1910. The schools of law themselves revolted from the old method of preparation. Plans are now afoot for giving more than one half the curriculum to economics and political science. The whole controversy has been fought out on the questions of the particular sciences needed by the administrator—and it has been generally conceded that the social sciences must be preeminent, if not alone; and of the quality of mind producible by different disciplines—and here the results of legal training have been universally deplored, for it has overrated authority and diminished the sense of personal responsibility, while the juristic method of subsumption has tended to destroy free inventiveness. Furthermore, it takes at least seven years from the time of entry into the university before an aspirant for the civil service has an "established" position not under tutelage. This is now recognized as deferring for too long the independent practical enterprise of the administrator.

As in Prussia the British civil service is recruited by a uniform examination regardless of the different branches into which the candidate may go. But here the similarity ends. For British "open competition" began tentatively in 1854. It was strongly molded by the educational views of Macaulay. He held that special preparation was unnecessary inasmuch as mental capacity could be tested equally well by competition in the ordinary subjects of the university curriculum, however remote they were from the objects of administration; and that the mental capacity thus discovered could pick up the necessary technique in the course of actual work. To pass the examinations would demand industry while at the university and this would be some guaranty of moral as well as mental excellence. This method of preparation has persisted, although the university subjects have enormously increased in number with the progress of science and teaching. Recent agitation has even caused the introduction of the classics, mathematics and the natural sciences, of law in its various

branches and of economic and political science. The main lines of Macaulay's scheme still remain: a liberal rather than a special education and employment almost immediately following graduation, which means about the age of twenty-three. The British system stimulates early readiness for responsibility, sound critical ability and "manner," which goes far in the business of government since it combines force with urbanity, while the German system not infrequently omits the latter. But the British system lacks technical preparation and a period of organized probation.

France evolved later than England a method for recruiting its higher service. It has no single examining body as in England, Germany and the United States. Recruitment is carried on by each separate department and each department prescribes its own qualifications. Certain specific university diplomas are required and a technical examination follows. Perhaps the preparation is too special, as is the case in the United States, where the general administrative class, when not recruited by patronage, is recruited by an examination in a specialty. Nor are the American universities the conscious breeding places of future administrators.

(2) Promotion hardly affects the highest class of civil servants. They usually have interesting work and receive a comfortable salary. Seniority or merit plays its part according to the changes and chances of the service, which vary greatly between departments whose expansion or contraction depends immediately upon parliamentary policy. But for the lower classes promotion is a serious matter. In addition to improving the morale of the service a proper promotion policy may secure the fullest economy by the proper distribution of effort and talent. Various questions arise in connection with such a policy. Shall experience and talent acquired during service be rewarded by promotion even into the highest class? How shall such experience be measured? What remedies has an aggrieved servant against his treatment? The first question has been answered in the affirmative only within the last twenty years—and that not by all countries nor with equal liberality. No answer at all was given until popular attention was attracted by the efforts of civil service associations, which complained of class distinctions and of the waste of talent in inferior jobs. In England and Germany promotion to the highest class is rare, but there is a more generous opportunity between the lower and middle ranks of the

service. In France promotion to the top is practically unknown, while in the United States it is impossible without the passing of prescribed examinations, which is practically equivalent to a new entry. Within each grade salaries rise by annual increments and these can everywhere be withheld if the employee is not competent. The United States efficiency rating scheme of 1925 even arranges a calibrated scale of efficiency correlated with so many dollars of salary. But the raises tend to be automatic and demotion almost unknown.

The basis of promotion has been seniority or merit or a combination of these two. Seniority is a widespread practise due to the fact that it causes fewest surprises, produces least jealousy and obviates both the onerous task of choice (which is always difficult in routine jobs) and the mortification of the unsuccessful. Since experience increases aptitude, seniority promotion up to a certain point is sometimes conducive to technical efficiency. More often, however, it has the opposite effect, since it promotes the incompetent aged and wastes the younger talent. Merit has therefore been urged by the interested public and the associations, which are usually led by comparatively young men.

The question then arises of how to test merit. An objective measurement is needed independent of the personal judgment of the official superior. This has in part been supplied by such methods as the records sheets and efficiency records of England and the United States and the *Personalakten* of Germany and the *dossiers* of France. In the former countries qualities are distinguished and marks annually awarded by a superior officer. Promotion proceeds according to merit thus measured. This system fails, however, to exclude personal favor inasmuch as a superior officer is still the judge. Nor does it overcome that unwillingness to discriminate born of collegueship. But it does cause the mind to concentrate intensely at regular and fairly short intervals upon the comparative merits of the reported group and furnishes a cumulative record of years to replace hasty and careless judgment at the moment of a vacancy.

In the quest for relief from arbitrary promotion other devices have been suggested, and sometimes adopted upon pressure, by the civil servants. In France it has been suggested that promotions be made in certain fixed proportions for seniority and merit; and in one department a promotion committee includes several representatives of the lower ranks of officials who par-

ticipate in the drawing up of promotion lists. Any violation of the order decided upon is challengeable before the Conseil d'État. In England promotion boards exist in each department, and the general problems of this work are discussable by the Whitley Councils. Only in Australia is an appeal to the central controlling authority permitted, and a large number of promotions are challenged by aggrieved servants and some overturned.

(3) The problem of discipline in the civil service is governed by the fact that the civil service is not a concern making a profit measurable in money or dependent upon the satisfaction of consumers in a competitive market. In private enterprise the profit making motive causes the method of payment by results to permeate the whole personnel; and this is an automatic disciplinary method. But the public service is normally monopolistic, and it serves a market usually inelastic—its expansion being limited by the statutes creating the departments and their activities and not depending upon the effort of the servants. The services are “sheltered” and the value of the work is not measurable with exactness. Its excellence can be secured only by a code of discipline founded upon the nature of the service. All civil services, therefore, have such codes, not differing essentially from those actually operative in private industry but expressly and authoritatively formulated. We may take the code of Germany as being the most explicit, although every country is approximating thereto, and new countries like Australia and South Africa actually write the codes of discipline into their public service acts. The German code enjoins: the conscientious discharge of all duties pertaining to the office in accordance with the constitution and the laws; obedience to the official orders of superiors in so far as they are not contradictory to the law; behavior worthy of the respect accorded to the office; the discharge of official duties with all possible sincerity and probity, with impartiality, industry and care and with indifference to private advantage; strict maintenance of the hours of service; acceptance of new work corresponding to training and capacity and not derogatory thereto; truthfulness in all official dealings, even when under a charge, and disclosure of all facts which concern the welfare of the service; respect to superiors and, to the public, courtesy, kindness and helpfulness; defense against insult; such a private life that the dignity, confidence, respect and efficiency of the service shall

not be impaired; permission before any part of the official's time may be spent in extra employment; official secrecy.

These rules as well as others of a like nature are ever present threats to insure subordination and devotion to duty. They are in fact in the nature of a state religion, of commandments emanating from the nature of the state. In fact the taking of an oath of office has been and is required in Germany and most other countries, the ostensible purpose being to invest office with the authority of religious mysticism. The great difference between continental and Anglo-Saxon countries is that the former have their codes stated publicly and in a convenient form, while the latter have no systematic and public body of doctrine. Furthermore the continent has a regular procedure culminating in properly constituted disciplinary tribunals where servant and superior may be judged, while few English speaking countries except Australia provide courts of appeal outside the departments or the treasury.

For the purpose of exercising disciplinary pressure the Prussian service of the eighteenth century developed a crude system of spying upon officers, followed by secret delation. It lasted until the nineteenth century when it was replaced by a more refined system of secret *dossiers*, revealable during disciplinary procedure. Essentially a method of terrorization, it was the natural outcome of the origin of the service in military organization and of the fear of imminent downfall always felt by a monarchy. The development of the theory of *Rechtsstaat* and of democratic organization resulted in an onslaught upon secret records. The German constitution of 1919 abolished such secrecy and analogous development has occurred in all other countries. Democracies have so far found that a sufficient incentive can be otherwise engendered.

One aspect of discipline especially significant in the modern state is the question of the right of civil servants to associate and ally themselves with other professional and industrial groups who may by their economic or other claims come into more or less violent collision with the will of parliament. This question has arisen most naturally and in its gravest form in countries like France where civil service conditions have been bad. Furthermore civil servants, especially in the subordinate grades, tend to feel that they have social affiliations with the working classes and to desire to support their policies. In all countries, therefore, the questions of association

and the right to strike have arisen. Because of the urgency of the services which the state must perform no country admits the right to strike. All countries permit association, but their practice varies on the question whether civil servants may affiliate with trade union bodies who may command or incite them to strike. France does not allow affiliation; Germany does; the United States does not forbid it; while in Great Britain, although it is now forbidden, the question cannot be said to have been finally answered. Those who are against strikes and affiliations add the further argument that in proportion as civil servants are given such rights as pay, superannuation, settled means of promotion, redress of grievances and immunity from the fluctuations of private industry they must not endanger by their withdrawal from duty the social organization which makes these conditions possible. A halfway ground is being established in the form of arbitration courts and of councils representing both the staff and the higher authorities. These have been best developed in Great Britain, Germany and Australia.

(4) One of the most difficult problems that the civil service presents is that of its pay. It is not doing work which can be measured exactly in terms of any similar work outside. Its members are subject to special rules of decorum and are deprived of some of the general civic rights. Entry into it is dependent upon qualifications above the average of the ordinary clerk in the business world. It offers no exciting prospect of riches gained at an early age. The service is peculiarly one in which a rapid turnover of personnel is undesirable. It is also one in which resignation involves the surrender of guaranteed rights. There has always been the immensely difficult problem of establishing fair rates of pay for the various grades of the civil service.

The amounts paid for civil service work vary in different countries and are conditioned by several factors. Perhaps the most important consideration is the general level of payment and working conditions prevailing in the country. In France where this level is not very high employees tend to remain in the service at low rates, whereas in the United States civil servants are constantly tempted to outside employment. The other significant factors are the intelligence of statesmen and the strength of the civil service associations which represent civil service views and marshal the facts for judgment.

(5) Since democracies have become the masters, of the civil service emphasis has neces-

sarily been placed upon its relation to parliaments and the public, and many new questions have been raised. Ought civil servants to obey any government which has parliamentary confidence regardless of their own conscience? How far ought they enjoy the political rights of ordinary citizens? What is the public's attitude toward civil servants, and their attitude toward the public?

Thus far practise has shown that civil servants have been enjoined by governments of the most diverse political views to remain the neutral servants of the state. It has been recognized almost universally that interference with this neutrality means the loss of technical skill to the state as a whole, and only the most extreme minorities of the Left and Right have been ready to sacrifice this neutrality by "purification" of the services. This doctrine has a high ethical import and requires for its maintenance a spirit of renunciation; but hard as it is the whole effectiveness of democratic government rests upon it. A counterpart to this doctrine is that which holds that civil servants should occupy an anonymous position in the machinery of the government, that is to say, that all responsibility should be concentrated upon the political ministers and that the names of civil servants should in political discussions never be mentioned in either praise or blame.

The question of political rights is directly connected with this. If the civil servant is to be the impartial servant of all governments, the less the civil servant has to do with politics the better. For any practical and observable connection with a party may at least produce suspicion of partiality, and suspicion of political favoritism spreads rapidly through a staff. Practise has been various and vacillating. The vote has not been denied, but in Australia, the United States, Canada and South Africa wider participation in politics is forbidden. This limitation is the result of a reaction from the spoils system. In France a varied history has ended with the abolition of legal hindrances to political activity; even election to the chambers is permitted, the official being "seconded" during membership. The same applies to Germany, where the tradition arose owing to the impotence of the assemblies and the desire of the crown to have its spokesmen in them. But careful restrictions are imposed to insure that political activity shall not be pursued during official time or with the use of any official means. In England only the industrial workers of the state are permitted to stand

for election, but not the administrative employees, who, however, may with permission participate in municipal government.

The science of the desirable relations of the public with the services is almost entirely unplumbed. Until recently the public has been the governed; and when this relationship began to break down, power was transferred to the parliament, not to the public. But it has been observed in the last two generations that parliaments are incompetent to do more than regulate the services in a broad and general way; it is only on widely separated occasions that complaints can be brought before representative assemblies absorbed as they are with vital matters of general policy. An occasional and general reprimand has proved insufficient. A day by day commanding presence is required. This is obtainable informally by public knowledge of the work, the rights and duties of the services and by a well developed sense of public mastership, which is the only real preventive of bureaucratic temper. It may be obtained formally by the establishment of advisory councils for each department or special division of a department through which public complaints can conveniently flow directly to the administrators; and there are already signs that these are being created. But public knowledge and a sense of mastership are laggards and poor matches for official usurpation. The latter varies much from country to country, but everywhere it is true that entrance to office tends to breed a cold and rough insolence, however slight. This is partly due to the official's own answerability to superiors. It is due also to the consciousness of power. It can be mitigated only by deliberate education.

(6) Finally, there is a great variation in the treatment of a civil servant's liability for wrong done in the course of official action. The Anglo-Saxon doctrine—from which Australia now dissents—is that liability is exclusively the official's. He is responsible and must therefore pay. The merit of this doctrine is that personal liability may cause circumspection. But few officials are really ill willed. They sin rather by ignorance or accident or as a result of being given defective commands. The alternative method adopted on the continent is for the state to accept liability, since the official is usually unable to pay compensation for his error, and then to take disciplinary action (*Rückgriff*) against the official in special administrative courts. The English have held the erroneous view that this system favors the official. In fact the courts have given juster

judgments than elsewhere, for they are composed of men with judicial training, enjoying regular appointment, familiar with regular procedure and yet versed in the technique of administration. It seems likely that the continental method will in principle be generally adopted; for everywhere the state, but recently commanding by the show of coercion, is transforming itself into a state ministrant and responsible.

CIVIL WAR is military conflict between two or more approximately equal political governments for sovereignty over people and territory native to both. In contrast revolution is a change, not necessarily brought about by force or violence, whereby one system of legality is terminated and another originated within the same society. Numerous important revolutions, like that of 1688 in England and that of 1848 in France, have involved almost no military conflict. Civil war may accompany revolution, but even in the great French Revolution it played only a secondary part. Civil war is also to be distinguished from insurrection, which is a struggle from the bottom up—an uprising of a more or less politically unorganized group against an established authority. Civil war is horizontal, insurrection vertical, conflict.

Civil wars may be classified roughly as religious, political or social. The rise of Protestantism caused a whole series of religious civil wars between 1550 and 1648. The civil wars in England during the years 1641 to 1651, in the United States from 1861 to 1865 and in China from 1921 to 1928, were political. The history of ancient Greece and Rome shows a whole series of social civil wars between rich and poor, aristocrats and plebians. The Russian civil war of 1918-21 was primarily a social war between the upper classes on the one hand and the city proletariat aided by the peasants on the other.

Religious civil wars have usually been very bloody and ruthless. Social civil wars tend to resemble them in this respect, while political civil wars are commonly humane—as wars go. The Thirty Years War was indescribably ferocious; the recent civil war in Russia was marked by much cruelty; while the American Civil War was comparatively well controlled.

The character of civil war varies considerably according to the type of political organization in the country in which it occurs. In unitary states civil war is likely to be amateurish and bungling in its early stages. The old government is weakened by the withdrawal of large numbers of its trained personnel, who then proceed to im-

provide an opposition government which does not at first function very efficiently. The English civil war of 1641-51 and the American Civil War are cases in point.

In federated states civil war closely resembles international war. Here organized functioning governments already exist and the task of generating a civil war between them is relatively simple, especially when the nature of the federal bond approximates a league rather than a closer union. The Thirty Years War, the War of the Sonderbund in Switzerland in 1848 and the American Civil War afford varying illustrations of the nature of civil conflict in federated states. Civil wars in colonial states are in general much like civil wars in federated states except for the fact that they are always at least three-sided, the contestants being the two factions in the colony and the mother state, which as a rule unites with one colonial faction against the other.

The social situations which lead to civil war follow the general conflict pattern. An existing equilibrium of contending interests is disturbed by new conditions. There is a consequent unrest, which at first manifests itself in discussion, argument and debate. In the course of this discussion certain issues, important and even fundamental in the life scheme of the society, become clearly defined. Since they cannot be settled by peaceable methods, such as elections, for the reason that neither of the parties is willing to abide by the result of an adverse ballot, the society gradually separates into antagonistic factions. Anything done by one faction to advance its interests irritates the other into counter moves. The strain increases by a process of cyclic interaction and animosity becomes intensified. At this stage almost any untoward event, of however little importance in itself, is sufficient to precipitate a crisis. The occurrence of some such event is inevitable under the circumstances and military conflict begins as the response to the crisis created by the previous conditions.

During this process group becomes estranged from group within a community and even members of the same family may be divided. In general the population of one section of the territory in which the civil war occurs will favor one faction, another population area will favor the opposite faction, while the population in the area that lies between will be more or less evenly divided. The military struggle is likely to be most intense in this area of divided loyalty. The two factions in a civil war are much alike despite

their antagonism, since they are simply parts of an originally united group. As the civil war proceeds they become more alike, thanks to the practise of copying each other's technique. Within each of the two opposing forces develop smaller factions which may gain increasing importance as the war goes on. During the American Civil War the Copperheads in the North were such a minor faction while the inhabitants of eastern Tennessee played a similar role in the South.

Civil war as contrasted with foreign war is, for one side at least, war for complete conquest—for the extinction of the enemy government. It is a struggle for existence, whereas in modern times foreign war is as a rule waged only for certain specific and limited aims. In the case of a foreign war a government has a more complete command over the loyalty of its subjects than in the case of civil war, when a not inconsiderable minority of the population on each side is more or less apathetic or hostile to the purposes and aims of its government. Each government, therefore, has to divert some of its military force to the task of holding down this discontented element within its own territory. The extent of this diversion of military force is frequently so considerable as to affect appreciably the progress of the civil war. Again, in foreign war, campaigns have usually been planned by military staffs during time of peace. This is seldom the case—indeed it is seldom possible—in civil war, and for this reason military tactics especially in the early stages of civil war are ordinarily more hesitant and more ineffective.

Civil war ends in one of three ways. Usually one faction subjugates the other; but one may establish its independence of the other; or the two factions may become mutually exhausted and arrange a truce which may last till the emergence of new and different issues saps the vitality of the original antagonism. The American Civil War illustrates the first termination, the war resulting in the separation of Belgium and Holland the second, the Wars of the Roses the third.

A process of accommodation must then set in at the end of military operations. There is at first a tentative adjustment; the previously warring factions arrive at some working basis for carrying on the activities of ordinary life. The intensity of their animosity decreases as this process of accommodation comes to cover a wider range of relationships. At first the contacts of the former antagonists are few and unfriendly,

but gradually they increase in number and cordiality until at last a final adjustment is made and a new and stable equilibrium arrived at. As the civil war period recedes into history the former enemies may come to have a sentimental attachment for each other. While the question as to which government shall control is settled by civil war, it is as a part of this process of accommodation after the war that some scheme for deciding who shall man the new government is worked out.

As a result of civil war previously existing interest conflicts are either terminated or reduced to the competitive instead of the conflict level. The American Civil War terminated the conflict over slavery. On the other hand, following the military conflict between the Royalists and Parliamentarians in the English civil war of 1641-51, the same issue of monarchical absolutism appeared in the next generation in the political conflict of Tories and Whigs. In either case civil war commonly has far reaching effects on social institutions.

Civil war is not infrequently terminated by the intervention of foreign powers, as in the cases of Greece and Turkey in 1821-29, Hungary and Austria in 1848-49 and Belgium and Holland in 1830-32. During the course of a civil war, also, foreign powers may exert considerable influence. They may recognize either the belligerency or the independence of the faction carrying on civil war against the state of which it is legally a part. The recognition of belligerency confers upon such a faction a de facto international character in respect to the rights and duties of legal warfare. These include such things as the right of admission of the ships of the recognized faction into the ports of the recognizing nation, the right to borrow money on the credit of the de facto state which has been recognized, the right of visit and search at sea by the ships of the de facto state, the confiscation of contraband goods and the maintenance of blockade. The act of recognition imposes upon other nations the obligations of formal neutrality between the contending parties.

The recognition by foreign powers of the independence of new nations formed as the result of civil war is, like the recognition of belligerency, commonly though not always determined by the facts of the case. When the civil war has reached such a conclusion that it is manifestly impossible for the parent state to subdue the revolting community the latter is

recognized by such nations as find it in their interest to enter into official relations with it. Premature recognition of the independence of a revolting faction in a civil war may, as an interference with its right to retain control of its own subjects, constitute an offense against the parent state. In certain cases recognition may amount to intervention. The collective recognition by the great powers of the de jure independence of Greece in 1827 was considerably in advance of its real independence and was the decisive element in the situation. This was true also of the recognition of the independence of Cuba by the United States in 1898 and of the recognition of the independence of Panama in 1903. In the two former cases international war was the result of such premature recognition. If the foreign powers believe it to be in their interest to recognize the belligerency or the independence of a faction in a civil war they can always do so at their own risk; such recognition has frequently been the most important factor in determining the issue of a conflict.

CIVILIZATION. The term "civilization" although derived from Latin is only an indirect derivation. In classical Latin the adjective *civilis* and the substantive *civilitas* denote general qualities connected with the citizen (*civis*) and more particularly a certain politeness and amiability, especially as shown by superiors, for example the Roman emperors, to inferiors. In the Middle Ages there seems to have been an extension of the meaning of the term, as in Dante's *De monarchia*, where *humana civilitas* denotes the largest and most comprehensive

social entity rising above the individual, the family, the neighborhood and the nation.

The present form and connotation of the word were created by the rationalists of the eighteenth century, above all by Voltaire and the other French *encyclopédistes*. Dr. Johnson's biographer, Boswell, was the first to introduce it into English. The emphasis then clearly lay on the antithesis of civilization to feudalism and the "dark ages," and the group of value judgments bound up with this typically "enlightened" emphasis has ever since affected the concept of civilization and civilizing activities. The underlying premise, more or less uncritical, of the direct and rational progress of society and mankind is still most characteristic of the conception of civilization prevalent in America and the western European nations, while from Germans and Slavs have come repeated protests against the arbitrary and artificial character of the assumption of uniform civilization and progress.

The ancient Greeks and Romans did not draw a general contrast between the condition of the citizen body and the absence of material or mental progress. Indeed, they were given to identifying their own stage of social organization with that proper to man as such, and conversely to regarding as "inhuman" the men and societies they designated as barbarian. But the contrast was one of mental and personal accomplishment rather than of political freedom and equality. They did not hesitate to assign to barbarians an inferior status inside their own more "human" society. What they felt as the source of their own superiority was rather the mental refinement they described, by a metaphor from agriculture, as *cultura animi* (Cicero). In a similar sense modern writers have frequently insisted upon a concept of "culture" as independent from, or even opposed to, that of civilization. But the controversy centering in this conception has been blurred to a large extent by the passions of the World War era. It may be said in general that it is not advisable to neglect either the cultural aspect of civilization (as a more comprehensive idea or reality) or, vice versa (if civilization is conceived of more narrowly as technical and material progress), the part which the civilizing process plays in all culture.

The most persistent and pervasive antithesis to civilization is neither the ancient conception of "barbarism" nor the eighteenth century conception of an "unenlightened state" preceding the "enlightenment," but rather the anthropo-

logical and ethnological phenomenon of so-called primitive peoples (*Naturvölker*). This phenomenon presents a very difficult problem. It raises questions not only as to the nature of progress and the methods of attaining it but also as to the differences between (relatively) more stationary and more changing racial or social conditions, whether progressive or regressive. In the "primitive" tribes and races, which show a very small measure of development or, apparently, even fitness for development, both before and after their contact with "civilized" man, the riddle of Darwinism seemed to be transferred from physical to mental evolution. Here too there was the theoretical possibility of arranging different types into bio-genetic series, but hardly any empirical proof that one series had really developed out of the other. On the contrary, objective studies showed a high degree of mutual impermeability between these types.

With increasing maturity ethnology has lost its first assurance of a clearly defined path between prehistoric and modern man or of definite stations on this path to be assigned to different civilizations. At the same time a shift in emphasis appears to have taken place. The older ethnologists and sociologists were busy trying to find a boundary line separating the more general concept of civilization, as a system of social custom and organization, from the more special sense of the term, as denoting a higher, more rational and more commanding position of man in nature and society. Any such boundary line could not but be more or less arbitrary. If for example the use of writing as a method of fixing thought and the memory of generations beyond the reach of oral tradition was taken as the chief characteristic of civilization, in the sense of a superior state of man, recent research into the "ideographic" writing of dead and living languages has revealed the extremely slow, gradual and equivocal development of this method of fixation in connection with the evolution of speech and thought themselves. Modern sociology and anthropology, therefore, have come to distinguish not so much between higher and lower types of civilization as between the animal basis and the human superstructure in man and society at any stage, whether early and primitive or late and complex. This latter line of inquiry is apt to give a more balanced and objective view of social evolution since it directs attention more equally to the gains and to the losses involved in the evolution of the human superstructure. However much exaggeration there

may have been in a recent fashion of treating man, and particularly modern man, as "degenerate," there is surely much to be said for the underlying assumption that the specific functions of human reason are to a considerable extent merely compensations for the weakening or loss of the play of animal instincts and habits.

From this newer and more objective viewpoint the old problem of the diversity and succession of civilizations assumes a more precise form. There is on the one hand a possibility of starting from the assumption of a more or less uniform natural endowment of man with a consequent more or less uniform development of this endowment in different societies, the "phylogenesis" of these societies repeating, more or less independently of outside influences, the "ontogenesis" of individual man from childhood to old age (or conversely, the individual man repeating the experience of the race). It was this uniform scheme of development from within that was conceived by Adolf Bastian as the "elementary thought of all peoples" (*Elementargedanke*). On the other hand, there is a possibility of starting from the assumption of different racial endowments, thus broadening and diversifying the animal basis of human development. From this point of view race becomes an independent variable amid the influences of physical and historical surroundings, and a much more important place is made for mutual and one-sided "receptions" of civilizations and the "diffusion" of higher throughout lower civilizations. Conceptions based on the hypothesis of racial differences have recently attained a certain currency in theories like that of Elliot Smith on the diffusion of Egyptian civilization or those of Leo Frobenius and Oswald Spengler on the "cultural circles" of different races and regions. It is true that any group of racial traits empirically established is in *a priori* theory capable of being resolved into a series of historical acquisitions imposed upon a basic human uniformity. But this theoretical possibility has little meaning for the more important questions whether particular racial traits are of remote or of recent origin and whether they do or do not yield readily to the forces of adaptation. Here as elsewhere the markedly liberal character of the thought of the eighteenth and nineteenth centuries offered an exceptionally fruitful soil for anthropological confirmations of the "equality of man," while twentieth century thought is apparently favorable to a reconsideration of the doctrine of the aboriginal diversity of civiliza-

tions which only in its cruder and more biased forms can be said to be obsolete.

Racial homogeneity and diversity, if only in the sense of long term fixations of systems of psycho-physiological traits and habits in different social groups, is indeed an indispensable assumption in explaining the most outstanding facts of civilizations and their history. The co-existence in primitive and also in most later societies of horizontal or "democratic" principles coordinating the life of all responsible individuals, and vertical or "autocratic" principles subordinating one part of the population to another, points to the conclusion that the cleavage of capitalistic society into the "two nations" (as Disraeli described them) is only one case under the more general rule that what we call one civilization consists frequently of several systems of traits and habits superimposed one above the other. Even the difference of sex is thus capable of furnishing, as in primitive matriarchal or modern gynecoeratic arrangements, an ambivalent principle of social order. If once we cease to apply dogmatically the Spencerian theory about the succession of "industrial" to "military" civilizations we shall be struck by the equal mixture of force, whether actual or potential, and habitual subjection in modern and in primitive social dependence. And while at first sight the exclusive possession and use of arms appear to be the decisive factor in the rule of feudal lords and absolute monarchs, of Fascist and Communist parties alike, closer inspection reveals that outside of "epochs of transformation" actual force recedes before potential, and potential force in turn recedes before the more stable equilibrium of classes that rests upon their relative preponderance in civilization. The modern connection between democratic and nationalist movements is therefore not merely accidental. Both movements make for greater social uniformity, the one politically, the other culturally and racially. But in America and elsewhere both tend to fall into tragical contradiction with the "great society," which is characterized under the political surface of democratic government by economic and racial diversity and stratification.

Modern research has indicated that racial and other individual factors have played a prominent part in the development of civilization. Accordingly it has come to be an essential task of scholarship to account for the change and interchange of stages and systems in terms other than "psychic unity" and "mono-typical evo-

lution." A complete theory of migrations will have to elucidate not only the wanderings of man, but also those of things, ideas and institutions over the surface of our planet. The functioning of prehistoric and protohistoric trade routes over continents and seas and the conquering expansion of nomadic tribes may at first sight appear like antithetical activities, after the pattern of the Spencerian theory of the antithesis of military and industrial activities. But closer study reveals a common driving force behind both activities. The position of the trader without an adequate hinterland is analogous to that of the nomad pressed back by the desert. Both are forced outward into various enterprises, instead of being permitted to remain passive in circumstances affording a sufficiency. In connection with problems of this character detailed inquiry has to step in to replace empty formulae by realistic, if much more complicated, evidence. Old notions about the transfer of civilizations in space and time will have to be refined and revised. Besides the conscious and voluntary elements of what is usually regarded as the "renaissance" or "reception" of an older or foreign civilization the deeper unconscious and involuntary elements that transmit civilizing influences "through the air," as it were, have to be discovered. It becomes necessary to account for the influence of mechanical contacts and for the persistence of cultural material such as technical instruments, buildings or even sites of settlements. It is to be questioned whether any renaissance or reception, such as the well known renewals of ancient civilization by the late Middle Ages, would have been possible at all without a kind of underground continuity, as for example through the Roman church or the Roman Empire, which kept open the unconscious flow of civilized attitudes from the earlier source to the society which served as receptacle for civilization revived.

In this connection it may well be doubted whether there has ever been to any considerable extent what is called a "loss" or even a definite standstill of a highly developed civilization. The disappearance of the great civilizations of Central and South America and that of Central Africa does indeed appear to present as irrefutable evidence of the perishable character of a civilization as the continuity of Chinese civilization appears to present of its persistence. When, however, we take into account, on the one hand, the possible and probable radiation

of such civilizations (as for instance that of Central America into the Pacific and the Far East) and, on the other hand, the fact that they may merely have been thrust underground by the actively superior force of European enterprise, we are at least bound to reserve judgment as to whether the dead and the lost may not be either living in full vigor around us or else lying dormant and capable of shooting up later with renewed life.

Conversely, science ought not to accept too lightly and uncritically the assumption of a central stream or reservoir of "world civilization" into which select elements from the particular civilization of all ages and races may be received as so many tributaries. The weakening of the fundamental classical and mediaeval traditions of Europe that is going on under our eyes not only in revolutionary Russia but almost as markedly in peaceful America should warn us against hastily setting up the historic system of "European civilization" as a more persistent system than those that have disappeared before it.

We may look upon race as a kind of conduit for conveying the transferable contents of civilization, such as religion, art, science and language. Parallel to civilization in this sense is the customary and legal organization in governments and states, in its origin a substitute for primeval kinship organization. Just as the rigidity or flexibility of races has long been a subject of historical speculation, so the more or less transitory correlation between political organization and systems of civilization has been a favorite subject of inquiry. Opinions have divided in analogous fashion. Those who minimize the racial factor are inclined to stress the independence of "cultural development," while the "primacy of the state" has been accepted especially by believers in the multiplicity and individuality of the human mind. It would hardly be an exaggeration to say that the spirit of comparative and "universal" history, since the days of Aristotle and Polybius, has been determined by this problem of the relations between political and cultural change. The theories of the mediaeval church concerning a series of "ages of the world," seen as a succession of "monarchies" from Babylon to Rome, already contained very clearly the idea of a "translation" not only of empire but of the mission entrusted to it. Modern philosophers of history, from Montesquieu to Guglielmo Ferrero, in dealing with their favorite theme, the "grandeur et

décadence" of the Roman Empire, have elaborated the idea by trying to establish definite causal relations between political changes and changes in civilization. Even the last and most powerful attempt at historical system building, the "economic interpretation" derived by Karl Marx from the Hegelian concept of dialectical evolution, restates the old problem in terms of the contrast between technical "forces of production" and juridical "relations of production."

The Marxian system is strictly universal because it is strictly "materialistic." Only in its doubtful conceptions of the "future state" and its "classless society" does it show an element of freedom from the universal law of evolution. One type of the historical interpretation of civilization appears to present even a higher degree of generality. This is the type which likens to the ontogenesis of individual man from childhood to old age not only the whole of human evolution as an abstract and average of historical civilizations but also these single civilizations themselves. Both materialistic socialism and progressive liberalism make much of the social and economic gains from rational education and technical advance, factors capable of cumulative effect and suggesting the possibility of continuous progress. The ontogenetic view regards the different systems of civilization, such as the classical European or the capitalistic system, as so many parallel, and sometimes overlapping, life processes each with a primaevial, a middle and a decadent stage. From this point of view civilization is seen not so much as the maturing and progressive elements in this process but rather as the decaying and degenerating elements. In the last instance this view always results in the concept of a cyclical movement of mankind, in which the individual civilizations rise, fall and are replaced by their successors like generations succeeding one another, or like fashions and habits which first spread, then sink from "higher" to "lower" classes and finally disappear.

It is an interesting problem for sociology and psychology to determine the typical circumstances under which the cycle theory of civilization has taken such different, and yet at bottom similar, forms as those of the ancient Stoa, the modern school of Rousseau or the Indian doctrine of incarnation. These theories differ chiefly on questions as to what are healthy phenomena and what are decadent; they differ also on the point whether a new cycle would have to go back to the same starting point as

the old, or might keep some of the gains of the old and advance to new goals.

To the scientific observer there is an accumulating momentum and an internal coherence in certain aspects of civilization, such as the scientific and technical, as well as a revolving movement in certain others, such as the religious and artistic. Surely the common view that "man is many, and civilization one" is incorrect. But neither is the reverse thesis that "man is one, and civilizations are many" sufficient for other than quite general purposes. Practically we shall do well to assume that man is many and civilizations also are many.

M., *Social Origins and Social Continuities* (New York 1925); Weber, Alfred, "Prinzipien zur Kulturosoziologie" in *Archiv für Sozialwissenschaft und Sozialpolitik*, vol. xlvii (1921) 1-49; Brinkmann, C., "Der 'Überbau' und die Wissenschaften von Staat und Gesellschaft" in *Schmollers Jahrbuch*, vol. liv (1930) 437-56.

CLAMAGERAN, JEAN JULES (1827-1903), French statesman and economist. An ardent republican, he became involved in the attempts of Ledru-Rollin to curb the growing power of Louis Napoleon and with their failure in 1849 was obliged to go into temporary hiding. After receiving his doctorate in law in 1851 he traveled extensively, especially in the United States, to which he was strongly attracted partly because of his interest in its rapid economic development but especially because it represented to him the ideal of republicanism. His keen observations of his travels are largely recorded in his letters (*Correspondance*, 1840-1902, Paris 1906). Clamageran participated actively in the election of 1863 having been one of the editors of the *Manuel électoral* (Paris 1861; abr. tr. Edinburgh 1865), which was prepared as an aid to republican voters and candidates in that campaign. During the siege of Paris he was in charge of the important problem of provisions. With the establishment of the republic he entered more actively into political life, serving successively as municipal councilor of Paris, as councilor of state and finally as life senator. He was named by Brisson to the Ministry of Finance (1885) but ill health forced him to resign almost immediately.

Clamageran's chief economic work is the *Histoire de l'impôt en France* (3 vols., Paris 1867-76), a careful, scholarly study of French public finance from earliest times through the death of Louis xv. He wrote other works on specific phases of French governmental finance and his *La France républicaine* (Paris 1873) devotes an important section to the question of tax reform. While his economic views were those of the orthodox liberal school, with consistent adherence to the doctrine of free trade, his writings manifest a realism and originality of spirit which were strengthened by his studies in history and his practical experience in political and financial affairs. His liberalism in economics and politics carried over into his religious life, and he took a prominent part in the struggles between the orthodox and liberal elements in the Protestant church, to which he belonged. He stressed the importance of individual freedom in the interpretation of Christianity, and looked forward to the establishment of a universal Christian church which would embrace in its simplicity of faith all shades and opinions (*De l'état actuel du protestantisme en France*, Paris 1857).

CLAN. *See* SOCIAL ORGANIZATION.

CLARENDON, CONSTITUTIONS OF.
See BENEFIT OF CLERGY.

CLARENDON, EDWARD HYDE, FIRST EARL OF (1609-74), English statesman and historian. Elected to the House of Commons in 1640 Hyde played an outstanding part in English political history for nearly a generation. At first he identified himself with the popular cause, joining in the condemnation of ship money, but when the extremists gained the upper hand he turned royalist, became chancellor of the exchequer in 1643 and from then until 1649 was the king's right hand. During the nine years of Charles II's exile in France Clarendon was his principal adviser and in 1658 received the lord chancellorship and on the Restoration an earldom.

Throughout his career he stood unflinchingly and almost fanatically for two main principles, the monarchy and episcopacy. Although in later

years he professed to discourage the worst extravagances of the reinstated church party he favored the passing of the Corporation Act (1661) and the Act of Uniformity (1662), which respectively disqualified Presbyterians for municipal service and purged the church of its Puritan clergy. In his defense of royal prerogative he went to the extreme limit compatible with legality. His influence was openly directed toward making the crown as independent as possible of Parliament, by placing at its disposal ample permanent revenues. In 1667 his royal master, whom he had served with abiding devotion which led him at times to forget the duty of a patriot, relieved him of office. Impeached by the House of Commons he fled the country and died in banishment at Rouen.

His *History of the Rebellion and Civil Wars in England* (3 vols., Oxford 1702-04; new ed. in 6 vols. by W. D. Macray, Oxford 1888) and his *Life* (Oxford 1759, new ed. in 2 vols., 1857) rank as "human documents" of unique interest, although neither is distinguished by impartiality or accuracy.

W. H. DAWSON

Consult: Firth, C. H., *Edward Hyde, Earl of Clarendon, as Statesman, Historian, and Chancellor of the University* (Oxford 1909).

CLARKSON, THOMAS (1760-1846), pioneer British abolitionist. Clarkson was one of the few non-Quakers among the early leaders of the movement. He was active for over sixty years as agitator, organizer and writer, and as a leader in the fight on slavery ranks with William Wilberforce. His three main objectives were the universal abolition of the slave trade, the universal freeing of slaves and the orderly economic development of Africa and its civilization by missionary activity. Clarkson's interest in abolition was aroused during his student days at St. John's College, Cambridge. His Latin essay, "Is it right to make men slaves against their will?" brought him into contact with Granville Sharp and William Wilberforce and into the heat of the abolition battle. At the beginning of the French Revolution he spent six months in Paris, but although he enlisted the sympathies of Mirabeau, Brissot, Lafayette and Necker he realized no practical success.

As a collector of evidence Clarkson probably has never been surpassed among reformers. Illustrative of his zeal was his search of the ports of the kingdom for a man wanted as a witness, whose name he did not even know, but whom he

found on the 317th ship visited. He traced the fate of 20,000 seamen until he proved conclusively that the trade was not the nursery of seamen but their grave. Briefly, he gave "the Abolition movement its essential basis of hard fact" (Coupland, p. 101). As late in life as 1839 Clarkson threw himself into the work of the recently organized British and Foreign Anti-Slavery Society. He carried on a vigorous correspondence with Lord Ashburton and others regarding the interpretation of the extradition clause of the Webster-Ashburton Treaty, and urged Lord Aberdeen at the British Foreign Office to prevent the annexation of Texas by the United States. He interested himself in the fugitive slaves in Canada and in the free Negroes in the United States, keeping on intimate terms with all American antislavery groups.

Clarkson was the author of a score of books, of which the *History of the Rise, Progress and Accomplishment of the Abolition of the African Slave Trade by the British Parliament* (2 vols., London 1808) and *Memoirs of the Private and Public Life of W. Penn* (2 vols., London 1813; rev. ed. by W. E. Forster, 1849) are best known.

London 1847); Elmes, J., *Thomas Clarkson* (London 1854); Klingberg, Frank J., *The Anti-Slavery Movement in England* (New Haven 1926); Coupland, Reginald, *Wilberforce, A Narrative* (Oxford 1923); *A Side-Light on Anglo-American Relations, 1830-1853*, ed. by A. H. Abel and F. J. Klingberg (Lancaster, Pa. 1927).

CLARTÉ MOVEMENT. The Clarté movement was an attempt to organize writers and scientists both of the Allies and of the Central Powers into "a league of intellectual solidarity for the triumph of the international cause." It was started in France in February, 1919, three months after the Armistice, by an "appeal from the intellectual combatants of France to the intellectual combatants of the whole world." Its purpose was to oppose "continuing the war after the peace" and to rebuild the "International of Thought." The name of the movement was taken from a novel, *Clarté* (Paris 1919; tr. by F. Wray, New York 1919) by Henri Barbusse, who during the war had won the Goncourt Prize with one of the most widely read of all the war books, *Le feu* (Paris 1916; English translation, London 1917). At the end of the war the hero of *Clarté* has a vision of a revolution in the minds of men and the building of a universal republic; this was the inspiration of the Clarté movement.

Barbusse himself was the leader of the movement. With him were associated in the international directing committee, among others, the distinguished French writers, Anatole France, Georges Duhamel and Jules Romains; English writers such as Thomas Hardy and H. G. Wells; the Danish critic, Georg Brandes; the Austrians, Stefan Zweig and Andreas Latsko; and the American, Upton Sinclair. The members of this "fraternal group of free spirits" pledged themselves to help bring about "a moral revolution necessary for the reign of justice."

Clarté groups were formed in various countries but it was, above all, in France that the movement flourished. There sections were formed of men of letters, professors, teachers, students, artists, technicians and working men. Of these the *sections universitaires* were the most active. Cooperation between the intellectuals and the manual laborers was especially urged. A union of classes as well as of nations was hoped for on the principle that "the war between classes will be annihilated by the unification of classes as the war between peoples will be annihilated by the unification of peoples."

The official organ of the movement was *Clarté: Bulletin Français de l'Internationale de la Pensée*, a biweekly which made its first appearance on October 11, 1919. It was edited by Barbusse until 1927, when he became more and more closely identified with the orthodox Communist party in France. The journal then passed into the hands of a young French Trotskyist group, hostile to Barbusse. In March, 1928, the name of the periodical was changed from *Clarté* to *La lutte des classes*. In the meantime Barbusse had founded another international review, *Monde*. The Clarté movement as such ceased to function, although many of the ideals of its founder were carried on by the "Amis de Monde," international groups affiliated with the new review.

CLASS. The concept of class is concerned with the social differentiation of groups. In ancient times social differentiation was one not of class but of status or rank. Membership in a station of society was bound up with privileges in the realm of public and private law. Differentiation according to status was fixed; a man was born

into a certain station, his membership in it was determined by law and custom and a change of status was practically out of question. In contrast with this conception one may, with Max Weber, speak of classes as existing when a transition from one social group to another is easily possible for the individual, either personally or in the course of generations, and when such a transition does take place rather frequently. These two principles of social organization—that of status and that of class—are not easily distinguishable, for historically they are to be found existing side by side and often overlapping.

In common speech the term class is used in greatly varying senses. One speaks of upper, middle and lower, of propertied and non-propertied, of productive and unproductive, of educated and uneducated, classes. In this very general sense the term class is practically meaningless; it says only that a group of people have certain characteristics in common. To give this conception sharper outline and some scientific utility it must denote a group where the characteristics held in common are perfectly definite and already determined. Thus occupational groups, or classes, must fall outside the category. If they are conceived of as all those groups which, like the agricultural or commercial, have common interests merely because they are engaged in the same industry, the concept cuts only vertically through the population. Shipping magnates fall into the same industrial class with stevedores, bankers with bank clerks, landed proprietors with agricultural laborers. But the general concept of the word class today is a different one. It has reference not to occupational groups, where the common characteristic possessed is external and superficial, but to social classes; it is intended to analyze the social structure and the social stratification of the population. Landed proprietors and agricultural laborers, bankers and bank clerks, may have the same industrial interests, and a good business situation in the industry may benefit each of them; nevertheless, they belong to different social classes. A social stratification in this sense cuts horizontally through the population.

The writers on the question of what is essential in the concept of social classes fall broadly into two groups—those selecting the objective factors at the basis of class and those selecting the subjective. Among the former some regard as basic the ownership or non-ownership of the instruments of production—a concept essen-

tially Marxian; others lay less stress upon the distribution of property than upon the general standard of living, holding that in modern society the elements around which a class is built up are generally the same within a particular standard of living. Other objective factors have been selected as well; thus Max Weber builds the concept of a class upon (1) the possession of economic means, (2) external standard of living, (3) cultural and recreational possibilities.

According to the subjectivists classes are groups whose sources of income are similar and whose economic interests coincide. In this conception the subjective factor lies in a community of interest and outlook, rooted in the economic structure of any given period. Sombart, who has stressed this subjective aspect most sharply, conceives of a social class as a group which by its way of thinking stands for a particular system of economic organization. In such a view the common interests, common ideology, common consciousness of cohesion, come to the fore. Other theorists regard as essential the degree of esteem in which a group is held, thus making classes essentially a gradation of ranks based on prestige. This view approaches that of those who see no essential distinction between class and status but, as in the case of Spann, regard such theories as that of Sombart as too economic in foundation and too little concerned with the individual mind. They conceive of social division according to rank and class as universal. They classify the gradations of rank into social strata on the principle of "the subordination of the intellectually inferior to the intellectually superior." Such a conception seems to accord less with actual social conditions than with certain preconceived social ideas.

That various theorists should have found the essential nature of class in such different attributes is to a great extent due to their having in mind different historical periods, for in the historical development of classes essential changes have taken place in their nature. In tracing this historical evolution it will be necessary to premise a concept of class of the most general sort, to include all those situations where gradations of rank and relations of dependence occur, associated with differences of social position and variations in both outer and inner conditions of life so marked that we may speak of the group as having a common economic position. One other premise is necessary in order to distinguish class from status—that mobility from one group to another be possible and that it frequently occur.

Using such a criterion we find in primitive societies group structures which have unmistakably the character of classes. Where a community is not a closed society with a caste system, certain individuals are often set apart from the rest of the community because of acquisition of wealth or display of unusual craftsmanship; hereditary aristocracies and priesthoods are also common, but the social mobility within them is relatively small. Fahlbeck and others have shown that the transition from a society of status to one of class occurred in Greece during the seventh and sixth centuries B.C. and in Rome somewhat later. As early as Hesiod we find a sharp criticism of the plutocratic tendency of the aristocracy, which expressed itself in the exploitation of labor. The first class conflict in Greece arose from opposition to the landed aristocracy. The peasantry, heavily in debt to the aristocracy under a system where debt led to slavery, brought about the Solonian legislation and the extension to a wider circle of citizenry of political rights and admission to public office. These reforms, as Fahlbeck has observed, while they did not efface the social distinctions, divested them of their legal sanctions and thereby transformed a differentiation by status into a differentiation by class. Formal freedom and equality allowed genuine classes to be formed through the operation of economic factors. Sparta alone, with a political social structure completely different from that of the other Greek city-states and clinging firmly to traditional forms of status, knew at this time nothing of classes or class conflict. With the industrial and commercial development that followed the Persian wars personal property became increasingly important and the conflict of classes was accordingly transformed. Under the emerging democratic forms this conflict was waged through the formation of parties and the struggle for political power. The demands for political and economic equality led eventually to the virtual confiscation of the property of the wealthy, usually through exorbitant taxation.

An essentially similar development occurred in Rome. A social differentiation on the basis of status, by which political power was concentrated among the landed families while opposite them stood a group of plebeians who although free had no political rights, was gradually broken down and the way opened for differentiation into classes. The centuriate constitution of Servius Tullius, under which the centuries were organized on the basis of property, was a crucial enter-

ing wedge, and this was followed by the wresting of political concessions from the patricians until the ever widening circle of those obtaining political rights came to include even freedmen. When the transition had been completed the development of Roman social organization continued in the direction of sharpening the outlines of the class structure. After the subjugation of Italy and the Punic wars inequalities in wealth were accentuated, and the newly emerging moneyed interests, especially the equites, won increasing power and attained a position beside the old nobility. The great latifundia came into existence. Largely because of the wars and the competition of grain from other countries the peasant class disintegrated, and attempts to retain it, like those made by the Gracchi, met with failure. Deprived of land and livelihood the peasants thronged to the metropolis, where they constituted an enormous proletariat and led a meager existence on public doles. Thus definite property classes emerged, with the sharpest contrasts in the distribution of wealth. With the economic collapse of the empire and the return to a "natural economy" the peasants were hereditarily bound to the soil through the creation of the colonate, and Italy reverted to the old system of occupational status.

In the Middle Ages the feudal system represented a social organization based on status. With the increasing importance of production for the market and trade and with the coming of the money economy, factors in addition to those of descent began to affect social differentiation. As early as the Carolingian period marked changes were evident, especially with regard to emancipation. Gradations arose among the free and the less free, and even within these there were divisions. Neither ranks nor classes remained permanent or unchanged but disintegrated into subgroups, and it is precisely these subgroups which were a significant symptom that changes were taking place in the system of social differentiation. Then gradations of this sort began to arise among the unfree as well. At the other end of the scale with the strengthening of princely power there emerged alongside the old aristocracy of birth a new aristocracy of office—ministers in the service of the prince. With the growth of cities and trade and the development of a money economy still another occupational class took its place with the aristocracy and the peasants—the burghers. We can thus discern office and vocation beginning slowly to determine social position and members

of the most diverse ranks by birth—even the unfree and the freedmen—finding it possible to move to higher social strata. These new elements did not immediately displace the old; the two functioned side by side for several centuries. And while the new classes were occupational they remained at the outset quite rigid. But wealth and vocation kept continually displacing the facts of birth and descent. Although one was as before born to a certain station in society, it became more frequently possible to attain to another. And with the shift of income and wealth to the newer elements even these occupational groupings came to be merely empty forms. From the sixteenth century until the present time economic and intellectual development have, to follow Schmoller, been making for the displacement of this system of social organization. In Prussia in 1807 the famous edict of October 9 decreed that everyone—noble, burgher or peasant—might, without detriment to his station, take possession of his property and engage in the pursuits of trade and industry; but this was merely the placing of the stamp of legality upon the product of centuries of slow but uninterrupted economic and social evolution.

While this evolution was essentially similar in all European states, the manner and time in which it took place differed. Particularly in the Italian city-states and in England and France the class organization evolved earlier than in other countries. In England the wealthy merchant class had by the end of the seventeenth century attained an influential place in Parliament. In France at this time numerous burghers had been elevated to the nobility and after 1715 they could acquire the estates of the nobility. About both countries Sombart wrote that since the time of the Tudors and Stuarts their nobility had been almost wholly transformed into an "aristocracy of finance and the countinghouse."

It was only at the beginning of the nineteenth century, however, that changes in the distribution of wealth attained so great an influence upon social stratification and social mobility as to transform the nature of the class structure. With the growth of capitalism and large scale industry and with advances in technique the economic element—chiefly the possession of property—played a greater role than ever in the determination of class membership. The more purely social factors yielded almost entirely to the economic, and the number of people increased whose lot it was because of their lack of property to belong always to the wage earning class. With

the advance of socialism there came to the fore an ideology deriving from the particular situation in which the working class found itself. Especially to members of those strata which seemed to be in the most desperate plight the crux of the class question was no longer found to inhere in the general situation mentioned above—mobility within the social groups as contrasted with the rigidity of a structure of status—but rather in the economic condition of each particular class. The emphasis had been shifted from the general antithesis between status and class to the economic differentia between particular classes. It was becoming increasingly obvious that membership in a certain class was determined by the distribution of wealth and income.

In this period, when popular education was increasing and when, above all, the growth of cities made social contrasts stand out more startlingly, the economic plight of a class could not but have a deep effect on the consciousness of the group concerned. Within a class common interests and a close feeling of cohesion are necessarily built up; and out of that the acts and the wills of those at the most diverse levels of the class are fused and consolidated into a common antagonism to the existing economic system and a desire for the creation of a new one. Out of this antagonism arises a community of opinion, belief and attitude. Sombart has defined four of such classes in the contemporary situation, each with its particular ideology: the feudal aristocracy as representative of a patriarchal proprietorship; the petty bourgeoisie, especially the handicrafts, as representative of an economic organization associated traditionally with craftsmanship; the bourgeoisie as representative of the capitalistic system; and the proletariat as the opponent of this system. It need scarcely be added that such a classification, while valid in its general outlines, is not equally so for all countries.

Thus in the course of historical development new criteria for the essential nature of classes have arisen to supplant the old. The emergence of such a criterion as the subjective one of a common economic ideology had necessarily to wait for the developments of the last century. Before that the workers as a class were too undeveloped to have a common consciousness of their plight and their interests; they were too closely bound to handicraft and to the particular nature of their own vocation. While there have been instances of class conflict in history—

notably in the classical civilizations—Marx's statement that "the history of all society up to now is the history of class struggles" must be rejected as too sweeping. The class struggle as motivated by a class conscious opposition to the existing capitalistic structure of society is a modern phenomenon. To project this concept upon the past, or to deny the existence of classes in the past as long as the common ideology we now predicate was absent, is equally confusing.

In clarifying the class concept it is of great significance to determine the manner of the origin of classes. Decades ago this problem constituted the subject of a controversy between Gustav Schmoller and Karl Bücher. The former asserted that classes were the result of the division of labor, the differences of occupation having certain physical and psychological effects upon individuals which were transmitted and crystallized by the natural selection of variations through heredity. Bücher, on the other hand, asserts a causal relationship running in the opposite direction, claiming that differences in wealth and in income were the cause rather than the result of the division of labor. While in the original formation of classes the division of labor may have had some such function as Schmoller suggests, Bücher's view is correct as regards its relation to the formation of modern classes.

While the determining forces in class formation have been in early times social and in recent times mainly economic, certain qualifications must be added. There has been a wish to see the formation of classes as a socio-biological fact—to view them as the outgrowth of the natural inequality and native differences of men in the struggle for existence. This thesis has been advanced in England principally by Sir Francis Galton in his *Inquiries into Human Faculty and its Development* (London 1883), in France by Georges Vacher de Lapouge in *Les sélections sociales* (Paris 1896) and in Germany by Otto Ammon in *Die Gesellschaftsordnung und ihre natürlichen Grundlagen* (Jena 1895). It sees the social elevation of individuals and therefore the formation of classes as a consequence of extraordinary ability and achievement. Such a view can have complete validity only where the competition which it premises is carried on between individuals who are at an equal advantage, and under modern economic conditions this is obviously an untenable postulate. Yet there is some value in the conception. Even today achievement and native endowment play in the formation of

classes a role whose social significance should not be lightly estimated. Experience shows that such an ascent of the social ladder does frequently take place, though slowly and step by step. The fact in itself that the higher levels reproduce themselves, generally speaking, only in insufficient measure makes such a mobility inevitable. From the economic standpoint as well this mobility is significant. It brings into industrial leadership a constantly self-renewing stream of ability from the masses.

Unfortunately, statistical science all over the world has thus far paid too little attention to the manner in which class formation takes place, although data could easily have been made available. In a society where movement from a lower to a higher class occurs to a great extent and where the workers are not politically subordinated, class conflicts are attenuated and the ideology of the class struggle finds it difficult to gain foothold. In the United States, for example, the opportunity for a worker to rise higher in his own class and even out of it into another is greater than in Europe, and his social position carries more respect; in addition, it has been asserted that the American political and economic situation is such that "a labor movement hostile to state and society would with difficulty strike root." The United States, while it is not by any means a classless society, is a good instance of how tentative and shifting class lines may become when the economic driving forces of a society tend to obliterate social and political distinctions and when they are themselves so completely in a state of transition that no class can remain crystallized for long. Even outside the United States one must be wary of conceiving a class as a completely homogeneous unit, economically and socially coordinated. Within the working class itself there are gradations and distinctions, and the transition from unskilled to highly skilled labor within a single generation represents in itself a great social advance.

The present day class structure of society has been attacked from two directions. The socialists have as their ideal a classless society, but it is more than doubtful that this goal can ever be completely attained. There are others who view modern classes as constituting a principle of social division dominated by the relations of the individual to production and acquisition and deeply concerned with considerations of equality or inequality of interests. Seen in such a way classes are purely mechanical constituents of society. Very recently the conviction has grown

that, while the earlier systems of status and rank arose spontaneously out of a common way of life and felt themselves to be organic units belonging to a whole and subordinating their interests to it, classes, on the contrary, are self-seeking and disintegrating groups whose destructive effect on state and society must be reckoned with. Over against considerations of this sort it is to be noted that many in Europe today look forward to a displacement of the class structure by a return to a division of the population according to ranks determined by occupation. Such a transformation has already been realized to a large extent in Fascist Italy.

CLASS CONSCIOUSNESS. Classes in modern societies may be described as groups of individuals who, through common descent, similarity of occupation, wealth and education, have come to have a similar mode of life, a similar stock of ideas, feelings, attitudes and forms of behavior and who, on any or all these grounds, meet one another on equal terms and regard themselves, although with varying degrees of explicitness, as belonging to one group. The psychology of class differentiation has not been studied with sufficient thoroughness and there is as yet no generally accepted technique for the observation, analysis and record of the behavior of groups in relation to one another. Accordingly it is extremely difficult to say what exactly one is conscious of when one is class conscious. In the case of the ancient and mediaeval systems of more or less rigid estates (*Stände*) this problem presented less difficulty. It was possible, at any rate in the case of the upper levels of society, to point to determinate interests and purposes common to and characterizing certain classes. Under modern conditions classes can hardly be defined functionally, nor is it always possible to specify precisely the interests or purposes which members of a class have in common as against others.

Nevertheless, it is a great mistake to minimize the reality of class distinctions even in cases where it is not possible to point to definite cohesive groups clearly aware of their collective interests. While classes may become associations, as for example when they form the basis of political parties, they are not as such associational and they cannot be defined by their ends or purposes. But the psychological factors which enter into class formation, although more vague, are not necessarily on that account less powerful than those which bind the members of associations to one another. They may be interpreted best, perhaps, in terms of the modern theory of "sentiments." These are systems of emotions or emotional dispositions centering around a common object or having a common nucleus. The sentiments which are important in this connection are of three sorts. There is, first, a "consciousness of kind," as it has been called, in relation to members of one's class, a confidence that one can meet them on equal terms and that one's mode of behavior will be in harmony with the behavior prevalent in the group. There is, secondly, a feeling of inferiority in relation to those above in the social hierarchy; and thirdly, a feeling of superiority in relation to those below.

All these states of mind are extremely complex. This is due partly to the large number of gradations in the social scale and the continual intersection of levels in mobile societies resulting in a very intricate intermingling of attitudes. There are, for example, the fear of losing caste, the dread of sinking in the social hierarchy, the desire of upward movement or of improvement of status at least for one's children, the keeping up of appearances. Further complexity is due to the well known fact that the sentiments of equality, inferiority and superiority admit of subtle and intricate forms of inversion and compensation. Here belong the phenomena of the exaggerated aggressiveness of the upstart and the arrogant humility of the upper classes when they enter into relations with the lower. It may be remarked in passing that conscious and unconscious attitudes of the kind referred to play no insignificant role in what is termed industrial unrest.

The primary determinants of social stratification are without doubt largely economic in character. Economic conditions determine an individual's occupation, and this in turn is generally a fair index of his mode of life and educational attainments, from which again may usually be inferred the sort of people whom he

would meet on equal terms, the range of individuals from among whom he would normally choose his partner in marriage and so forth. In most European countries there are important differences in modes of speech and pronunciation which indicate class differences (see Meillet, Antoine, *Les langues dans l'Europe nouvelle*, Paris 1918, p. 126), and there can be no doubt that an equalization of educational opportunities and an increase in the facilities for contact and intercommunication between the classes, tending to diminish differences in modes of speech (and dress), would be likely to lessen the feeling of class differences generally.

The intensity of class consciousness depends upon a variety of conditions. The first of these is the growth of a tradition embodying common experiences and leading perhaps to common aspirations. It is clear that a conscious esprit de corps developed earlier among the upper or ruling classes, whose solidarity of interest was more obvious and who inherited something of the spirit of the rigid and determinate estates.

Stability and degree of social mobility represent another factor in the intensity of class consciousness. Social status generally implies a certain permanence and relative immobility, sometimes guaranteed by hereditary privileges, as in the case of castes and estates, or, when legal privileges disappear, by economic and other social sanctions of sufficient strength to render mass movement from class to class difficult if not impossible. The amount of social mobility influences the intensity of class consciousness in various ways. On the one hand, if movement up and down is easy and rapid differences in mode of life must tend to disappear or to lose in importance. On the other hand, if movement is possible but not easy the effect is to heighten a consciousness of the differences, since there will often be a strong desire to rise coupled with a fear of decline in the social hierarchy.

Conflict and rivalry are also important factors in the promotion of group consciousness. Thus national self-consciousness is heightened through wars, whether defensive or aggressive. In the case of classes the possession of common interests by members of a group is often first brought into consciousness by the need of defense against a common enemy, imaginary or real, and especially by being pitted against another group already conscious of itself. The importance of the idea of the "class struggle" in the history of socialism is well recognized and need not here be further dwelt upon.

To the extent to which social groupings rest upon and express true social functions class consciousness clearly has ethical value. Respect for one's calling, *esprit de corps*, the feeling of solidarity with members of one's class are necessary elements contributory to the fulfilment of the common good. In the case of the oppressed classes, moreover, a dawning consciousness of class is an important factor in the growth of self-respect and may be even indispensable in the struggle for freedom. On the other hand, class self-respect may deteriorate into class egoism. This, of course, is not a danger peculiar to classes, but is characteristic of all social groupings. For example, the sentiment of nationality, although valuable frequently because it gives self-respect to oppressed peoples and thus acts as an important agent in the growth of freedom and self-determination, may deteriorate into chauvinism and the oppression of minorities. In what is termed the class state, government has frequently been in the interest of a dominant class, leaving the rest of the population in a state of subjection. This is true even of the class dictatorships of some modern forms of socialism, although it is claimed that the class element in their conception is provisional and transitory and that the ultimate aim is to abolish all class distinctions and to govern in the interests of all. Whether the elimination of class partisanship is really possible remains to be seen.

CLASS LEGISLATION. See EQUAL PROTECTION OF THE LAWS.

CLASS STRUGGLE is a phrase used to designate a form of social conflict, the theory of its origin and significance and the principle of action based upon such theory.

The idea of the importance of economic group

conflicts was not unknown to ancient writers. The differentiation of Greek society in the sixth and fifth centuries B.C., the conflict between the commercial classes and the landed aristocracy in Athens, Corinth and other Greek cities and the struggle of the *demos* for economic and political supremacy brought to the surface the idea of the divergence of group interests within the polity and of its effects upon political life. Plato and others pointed to "questions of interest" as the cause of the internal disorders of the Greek cities. It would be pressing the point, however, to assert that the concept of class struggle in the modern sense can be traced to Greek or Roman writers. Nor can it be said to be clearly discernible in mediaeval thought.

The roots of the idea lie in the French Revolution. Starting with a conflict between the third estate and the monarchy the French Revolution carried within itself the idea of estate or class. In its conscious aspects, however, the revolution was dominated by the idea of nationalism. It reconciled these contradictory ideas by making the third estate coextensive with the nation, by creating the abstract notions of man and of the rights of man and by postulating the individual as the unit of the nation.

Paradoxically the reaction against the rationalism of the Enlightenment carried forward the nationalist implications of the revolution for which the Enlightenment had provided the ammunition. The writers of the historical school of jurisprudence, the romantic poets, the political exponents of conservatism and such philosophers as Fichte and Hegel developed the theory of the creative powers of the "national spirit" and helped to give the concept of nation the prominence which it was to have all through the nineteenth century.

Beginning with the third decade of the century the other aspect of the French Revolution, group conflict, came to the fore. The struggle of the liberal elements against the Holy Alliance, the campaign for the English Reform Bill of 1832, the democratic upheaval of the thirties in the United States which carried Andrew Jackson into the White House, were clearly new steps in the forward march of the third estate. Historians and political theorists were stimulated by these events to rewrite history, and in the works of Mignet, Augustin Thierry, Adolphe Thiers, de Tocqueville, Macaulay and others may be found the first modern emphasis on group struggle as a historic factor.

Between 1830 and 1840 a new element en-

tered into the situation. The industrial workers came forward as the fourth estate, the new class of proletarians, and forthwith began to press their claims. In the contemporary literature of the labor movements of England, France and the United States the idea of class struggle made its appearance, and in the writings of the Saint-Simonists and of Louis Blanc it became more definite and precise.

These writers, however, are mainly fore-runners. Credit for the theory of class struggle belongs to Karl Marx and Friedrich Engels, especially to the former. These two authors after some preliminary groping in earlier writings formulated the doctrine in the Communist Manifesto in 1847 in a manner which has made it one of the striking and influential ideas of modern times. Marx further elaborated the theory in his *Zur Kritik der politischen Oekonomie* in 1859 and in *Das Kapital* (vol. i, 1867). He applied it brilliantly to the interpretation of the revolutions of 1848, of the coup d'état of Napoleon III and of the Paris Commune.

In broad outline Marx's theory asserts that in the course of making a living and of utilizing their technical and industrial equipment the members of society become segregated into classes which carry on different functions in industry and therefore occupy different positions in the social organization. Between these classes there arises an antagonism of interests and a struggle. Regardless of changes which have taken place in the industrial organization of society the division into classes and the struggle between these classes has persisted; hence the history of mankind has been a continuous struggle of classes. The modern capitalistic regime does not abolish the class struggle; it merely creates new classes and simplifies and intensifies the struggle between them. For with the development of capitalism society splits up more and more into two great hostile camps, the bourgeoisie and the proletariat. The bourgeoisie concentrates on converting surplus value into profits and the proletariat tries to resist this. In the ensuing struggle the workers realize that the power of the bourgeoisie rests on the ownership of the means of production and that economic exploitation can be ended only through the establishment of a socialist society based on collective ownership.

Marx predicated the inevitable victory of the proletariat on the assumption of certain inherent tendencies in capitalism: the rapid concentration of industry, the disappearance of the

middle class and the numerical growth and increasing misery of the working class. The modern class struggle was thus differentiated from previous class struggles in which one class succeeded another and used its victory merely to establish a new class rule. Under modern capitalism, inasmuch as the working class was absorbing all social groups with the exception of a small capitalist class, it could not emancipate itself without at the same time emancipating all society from every form of exploitation, oppression, class distinction and class struggle. Marx evidently intended to make a more detailed and exact analysis of the process of class formation and of class struggle. In the last chapter of the third volume of *Das Kapital*, "Classes," he raises but does not answer the question as to what constitutes a class.

Since class struggle was the dynamic factor which was carrying the historic process toward its final expression—the emancipation of the proletariat—it was necessary that the workers should do everything in their power to accelerate the process. In other words class struggle was not merely a theory but a principle of action and it became accepted as such by the socialist movement of the eighties and nineties.

With the beginning of the twentieth century the Marxian theory of class struggle became the subject of attack. Antisocialists tried to offset it by emphasizing the natural harmonies of society. Sociologists like Gumplowicz, Novikov and Durkheim stressed its limitations in view of the more dominating struggle between racial and national groups. More important still was the criticism which developed within the socialist movement itself, by the revisionists in Germany, by the Fabians in England and by the syndicalists in France. According to the revisionist Eduard Bernstein the trends which Marx had predicted were not currently dominant; as a result of political democracy and of the extension of economic opportunity the class struggle was becoming less and not more acute, and therefore the assumption of catastrophic change could not correspond to reality. Bernstein concluded that socialist tactics had to be revised in order to allow for cooperation between various economic and social groups and for a gradual reconstruction of social institutions to which sympathetic middle class groups might contribute. The Fabians, who visualized social change as a result of democratic and educational progress, could have still less faith in class struggle as a method or principle.

While revisionists and Fabians tended to limit the Marxian theory of class struggle the syndicalists found the theory not radical enough. Claiming that the class struggle was the only creative force in history and that Marxian political methods tended to weaken it the syndicalists elaborated the doctrine of direct action as a means toward reviving the idea of class struggle. To meet this double challenge orthodox socialists rallied around Karl Kautsky, who restated Marx's theories.

In recent years the theory of class struggle has become subject to new strains and tests. The World War revealed the potency of nationalist feelings and ideals. For four years class struggles throughout the world were either completely eliminated or overshadowed by the struggle between national groups. On the other hand the Bolshevik revolution in Russia, while reviving class conflicts, did so in a manner which was far removed from the clear cut Marxian formulae of pre-war days. These developments caused much confusion in the socialist movement which has not as yet been dispelled and which has reflected upon all socialist doctrines, including that of class struggle.

Present day exponents of class struggle may be divided into three major groups. One includes the reformist socialists represented by most of the socialist parties of the larger European countries and of the United States. In the literature of this group, although there is a ready recognition of the validity of the class struggle as a factor in historic development, the tendency is to stress more and more the democratic character of the modern state and the possibility of a gradual reorganization of social institutions. This group has therefore no particular interest in developing the theory of class struggle.

A second group is made up of the more radical socialists, best represented by the Austrians. The original Marxian emphasis on class struggle is retained but the most significant contribution of these writers consists in the attempt to elucidate the cultural and moral implications of the theory - the tendency of class struggles to lose the aspect of physical force and to depend more and more on intellectual and moral capacity.

Sharply contrasted with these two groups is the third, which consists of the communists, who have contributed most to the development of the theory of class struggle. The communists have been faced by two challenging facts. On the one hand, there was the post-war revival of national-

ism. On the other hand, the communists found that in their own efforts to establish a new regime in Russia they were forced despite an avowed class dictatorship to take account of the interests of the peasantry and of other groups and to try to work out conciliatory policies which were in essence nationalistic. Lenin was concerned especially with the problem of the relationship between industrial movements in capitalist countries and nationalist movements in colonial countries. His work was continued by other communist writers, especially by Nikolai Bukharin, who has been until recently the recognized theorist of communism.

The communists distinguish between social caste or estate, based upon legal characteristics, and social class, which is an economic category and includes persons who have the same function and who stand in the same relation toward other persons involved in the process of production. As the forms of production affect the forms of distribution, a social class is also characterized by its source of income. In other words, a social class is an aggregate of persons who have the same function in the productive process and who therefore have the same source of income.

The origin of classes is explained by the law of the division of labor. In every society there are two basic classes: one which commands and monopolizes the instruments of production, and the other a producing class. The specific forms of this relationship change from one society to another but in its essence it remains the same. In addition to the basic classes there are found in every society intermediate classes occupying a middle position between the commanding and the executing classes: transition classes resulting from the disintegration of previous group forms; mixed classes including persons who in some respects belong to one class and in other respects are more akin to another class; and *déclassé* groups consisting of beggars, vagrants and the like. The particular forms of these secondary classes also vary from one society to another, their variation giving color and form to the whole social structure.

In any class society the process of production is simultaneously a process of economic exploitation. Those who carry on the physical work receive less than they produce, not only because a portion is necessary for the extension of production but also because they have to support out of their work the owners of the means of production. The resultant antagonism finds its expression in a struggle for the distribution of

the total national product. As this struggle becomes conscious it gives rise to class interests and class conflict. The dominant minority tries to maintain and extend the opportunities for exploitation while the exploited majority continually strives to liberate itself. Gradually class interests develop into a system which embraces all life. They become intertwined with political, religious and even scientific interests. As these varied expressions of the class struggle become integrated they give rise to class ideals and to differences in class psychology.

The objective existence of class interests does not mean that these interests are always understood by the class itself. In fact, for a number of reasons, a class may be devoid of class consciousness; the inherent contradictions between classes may not become clear at once because economic processes go through several stages of development. There may be a temporary divergence between the general interests of a class and its temporary interests, and the latter may for a while dominate the situation. Moreover, the ruling classes usually try to influence the ideas and the psychology of the masses in order to destroy their consciousness of class interests. Class struggle, too, passes through various stages. There are periods when the antagonism of class interests is obscure and class conflicts are either totally concealed or of a minor character. Sooner or later, however, when the productive forces of society reach a point where their further development is obstructed by existing social institutions, the class struggle becomes acute and it is then that it becomes the main driving force of social reorganization.

Since the power of the ruling class is always concentrated in the organization of the state the oppressed class must aim directly against the mechanism of the state. Every class struggle is thus a political struggle which in its objectives aims at the abolition of the existing social order and at the establishment of a new social system. In order to prove capable of carrying through a social reorganization, however, the class must possess certain essential characteristics: it must be economically exploited and politically oppressed; it must be a producing class; it must be welded together by the conditions of its existence; and it must form a large mass or majority of the population.

All these characteristics, the theory maintains, are found in the industrial working population of the present day. It is for this reason that the industrial proletariat represents the only class

which can carry out a complete social revolution and reorganize society on the basis of the socialist ideal. The peasantry and the farmers lack most of these traits. But since the peasantry forms a large portion of the population in many countries it is essential that the industrial workers should ally themselves with the poorer elements of the peasantry.

Within each social class there are always a number of groups or subgroups which differ in position and ability. In order to unify the activities of a class it is necessary that one of these groups assume leadership. Such leadership can best be exercised by the organization of a political party which should represent the ideas and program of that section of the class which is most advanced, best schooled and most united.

Under contemporary conditions—the theory continues—the class struggle is assuming more and more the character of an alliance of the poor peasant masses and of the industrial workers against a financial oligarchy. Because of the growing internationalism of finance and industry the class struggle is also becoming more and more international in character, and will lead to a revolution on a world scale. This revolution will be violent, and its first step will be the establishment of class dictatorships throughout the world for the purpose of starting the work of socialist reconstruction. To promote this process the communists call for an accentuation of the class war and condemn all deviations toward "class collaboration."

The very development and modifications which the theory of class struggle has undergone indicate the difficulties which it encounters. It is not easy to define a social class or to draw sharp lines of demarcation between various classes. No definitive division of society into classes can be made on the basis of the so-called factors of production, on the basis of the law of the division of labor or on the basis of source of income. The most that can be said is that there is a tendency toward the formation of economic and social groups and that their stratification and stability vary from one society to another in accordance with general economic and social conditions.

By implication the struggle of classes is also merely a tendency. In modern society the struggle of economic and social groups is fragmentary and intermittent, concentrated around major issues of immediate and perhaps of only temporary importance. Moreover, since the formation of a consciousness of general interests

is slow and intermittent, it is inevitable that economic groups which are closely related should sometimes struggle against one another as well as against opposing groups. Thus there are conflicts between various groups of employers and capitalists as well as divisions of opinion between various sections of the working class. It is also inevitable that economic interests should be overshadowed from time to time by cultural, religious and racial factors. Nationalism, as both an economic and a cultural phenomenon, tends to offset the formation of classes. Economically each nation is likely to regard itself as a unit with common destiny and common interests as against the other nations of the world. Culturally it tries to consolidate its economic coherence by means of national ideas and ideals which permeate all groups of the community. All these limitations of the class struggle exist in present day national and international affairs.

To the extent to which it manifests itself the struggle of economic groups is a potent factor of social change. Manifestations of group conflict, such as strikes, reveal stagnant or decadent conditions and serve as a stimulus to their elimination or amelioration. Nevertheless, whenever such conflicts in the industrial field are concerned merely with group shares in distribution, regardless of their effects upon the productive process or upon society as a whole, they may result in social detriment. In large social transformations the struggle of classes may lead to a harmful process of disintegration; this is true especially when the struggle is carried on between groups and classes which are in an early stage of economic and intellectual development. Such class struggles have often resulted in social crises which were followed by the development of a new national solidarity.

CLASSICISM primarily denotes certain qualities especially revealed in the art of Greece and Rome. Its essential elements are restraint, simplicity, dignity, serenity and repose. It is further characterized by perfection of form, based upon a unity in which the detail is subordinated to the whole, and clarity of conception, which springs from an imaginative rationality. The Greek adage "nothing too much" expresses the spirit of classical art as well as classical philosophy. The purpose of Greek art, especially, was to invest the universal with beauty. In this respect it differs from realism, which is more interested in the actual and particular and which seeks factual veracity rather than ideal beauty. This difference becomes apparent in a comparison of Hellenic portrait sculpture, which tends to reveal abstract conceptions of character, with Roman statues, which resemble much more closely the person represented. Classicism is objective rather than subjective since its universal conceptions were derived, rationally as well as imaginatively, from the world of impressions. Its abstract nature, however, gives it an element of repose and aloofness from the jarring and conflicting elements of life.

Classicism found its most perfect expression in Athens of the fifth century B.C. A number of factors rendered this period most favorable for artistic development. The victories over the Persians in the first part of the century had removed fear of invasion and had greatly stimulated the nationalistic spirit. There was an unprecedented outward expansion of Athenian power and the city came to enjoy its greatest

commercial prosperity. The most important influence, however, in fostering artistic development was Pericles. Not only did he strive to achieve the highest ideal of democracy by giving all Athenians an active share in the government; he also proposed to make Athens the center of the highest art and literature by developing the Athenians' artistic taste. Toward this end he engaged Phidias and other artists to adorn the Acropolis with buildings and statues, the most striking being the Parthenon. That temple, together with the sculptures which ornament it, represents the high water mark of Greek architecture and sculpture. Pericles also fostered dramatic contests in the theater of Dionysus, at which the greatest writers of Greek tragedy, Aeschylus, Sophocles and Euripides, contended. Herodotus and Thucydides carried history to its high development in ancient times, while in philosophy, although the next century was the golden age of philosophical thought, Socrates made possible the later dialogues of Plato. Because of the democratic nature of the Athenian government at this time oratory became a necessary part of a citizen's training and it came to be reckoned one of the fine arts, reaching its highest development with Demosthenes in the following century.

After the Hellenistic or Alexandrian period the classical qualities of art appeared in Rome. Roman art, however, was for the most part imitative, derivative and at times artificial. With the possible exception of satire the Romans created no new literary forms and many of their metrical forms were derived from Greece. Their language, though more scientific than Greek, was not as pliant nor as adaptable to artistic conceptions. In architecture the Romans added only the arch to what they derived from Greece, while, with the exception of portrait sculpture, their statues were largely copies. They were more steadfast, determined and practical than the Greeks but lacked the latter's flexibility, versatility, manysidedness and imaginative power; nor were they as susceptible to beauty. We find in their art, nevertheless, the same qualities of restraint, freedom from extravagance and a sense of form and unity.

Classicism in art all but disappeared during the Middle Ages, but it was one of the most vitalizing influences in the Renaissance. With the revival of learning the asceticism of earlier centuries gave way before the rich humanism with which the classics are instinct. Sympathy with all aspects of human nature and a lively

interest in every activity of man, apparent in classical art, together with the inquiring spirit of Greek philosophy and science, stimulated and humanized the period. The architecture, sculpture and painting of the Renaissance showed classical qualities, but in literature the feeling for form achieved especially valuable results. The plays of the classical dramatists, those of Seneca in particular, were studied and imitated with the result that the formless traditional drama developed a compactness of structure evident in the best Elizabethan plays. Under the influence of the classics the invertebrate mediaeval romance assumed form and outline, partially in Spenser and more fully in Tasso, while in *Paradise Lost* Milton followed closely the classical epic. Ancient literary criticism, discussed and elaborated in numerous critical treatises during the Renaissance, inspired inquiry into the nature of literature and laid the basis for the development of a critical tradition in Europe. The classics furnished the Renaissance artistic principles and models, a sense of form and unity and an appreciation of, and desire for, artistic excellence.

In the second half of the seventeenth century, however, the classical spirit became overdeveloped both in too close an imitation of ancient art and in too rigid an interpretation and application of classical principles. A rationalism arose, owing partly to the new scientific movement and partly to overemphasis upon the element of rationality in Greek philosophy, which prompted men to distrust the imagination and suppress the emotions. Under its influence classical art and criticism became the reason and excuse for the most logically developed and rigorously applied set of literary principles the world has ever seen. The broad basic principles of classical art were narrowed into a set of superficial and hidebound rules. Form, order and reason were emphasized to the exclusion of beauty, feeling and imaginative truth. Because of the extreme limits to which this formalism was carried, classicism has incurred a prejudice from which it has not entirely freed itself. In no literary form is this narrow type of classicism more apparent than in the drama, particularly the tragedies of Corneille and Racine. The principles, especially the dramatic unities, laid down by Aristotle in the *Poetics* and elaborated upon by the Italian critics of the Renaissance, were so rigidly applied to dramatic composition that plot was impoverished, characters generalized and, on the whole, plays were removed

from the business of life. In the poetry of Voltaire, Dryden and Pope the classical spirit is manifested in the effort to achieve a correct style free from all extravagance and characterized by taste, restraint and good sense. Correctness, however, was sought in expressing proper shades of meaning rather than of feeling. In marked contrast to the literature of Greece, the work of the second half of the seventeenth and first half of the eighteenth century failed to reveal man's deeper emotional life.

In the second half of the eighteenth century a reaction set in against this neoclassical tyranny. The antithesis of classical art had been represented since the Middle Ages by Gothicism inasmuch as it was characterized by grotesque and extravagant designs, the unity of which was lost in a multitude of fanciful details. But as neoclassicism ran its course toward sterility the antithesis implicit in Gothicism found a more profound expression in the rise of romantic art, the main tenets of which were a claim for the truth of emotion and a belief in freedom of the imagination. In classicism the imagination is subjected to rational control; in romanticism it is liberated from all the restraint of reason and is obedient only to the particular moods of the artist. To the classicist truth is reason emotionally and imaginatively conceived; to the romanticist it is emotion imaginatively expressed. Thus there is a rational and ethical center to most Greek art, whereas in romantic art the tendency is away from any central control to an unbounded expansion. Romanticism is subjective. The classical artist subordinates his own personality to the demands and principles of his art; the romanticist follows his own inclinations and inspirations, looking within rather than without for the laws of his work. One expresses the universal, the other the unique or particular. Romanticism does not seek perfection of form; it expresses and inspires restlessness and agitation rather than repose; it aspires to the infinite instead of being confined within limits.

The rising spirit of romanticism manifested itself in more ways than in art. It can be found also in the religious, philosophical, educational and political ideas of the time. The love of liberty and the accentuated individualism which constitute a very important part of romanticism appear in the great democratic movement which found its most tangible expression in the American and French revolutions. The classical spirit, with its regard for law, order and conformity,

conspicuous in Edmund Burke and Samuel Johnson, strove in vain against the rising tide. Johnson especially, in whom was embodied that which was best in neoclassicism, carried on by his conversation as well as by his writings unceasing warfare against what he considered the pernicious principles of a philosophy which advocated unrestrained freedom in society as well as in literature.

In the present century romantic subjectivity has been developed to the farthest limit in a type of art, especially painting, called expressionism. The expressionistic theory, which interprets the function of art as the portrayal not of what the eye sees but of what the mind creates, stands out in sharp contrast to the objectivity of the classical point of view, which manifests faith in nature and impressions produced by it. Expressionism seeks to reproduce an inner vision, not an external image. The essence of classical art is imitation, interpreted in a broad way; the essence of expressionistic art is creation through power of the will and more or less independent of sensuous impressions. The greater intelligibility of classical art springs from the fact that the external world is known to all and conceptions expressed in terms of it possess the conventions of communication and are thus recognizable, whereas the inner vision is peculiar to the artist experiencing it and so affords little common ground for understanding.

Classicism would seem to thrive best in a conservative age. There is a certain affinity between the restraint, rationality and form of classical art and the spirit of law and conformity in the social world. Furthermore, since the standards of classicism are objective and depend not upon the individual but upon artistic principles which must be mastered through study rather than grasped intuitively, conditions should be favorable for the development of a nucleus of educated opinion and taste. A rich culture is essential to the production of classical art, which is a matter of the mind as well as of emotion and imagination. Thus a body of educated men paying allegiance to a common set of literary ideals is necessary. Classical art is not a popular art; it moves upon a plane distinctly above the matter of fact and utilitarian world. Embodying principles that have been established upon the highest achievements of man it pursues its ideal of truth and beauty without compromise with the transient and the ephemeral.

Although classicism may be carried too far and so tend to become narrow and formalized,

at its best it is health and sanity. It always furnishes a salutary corrective to extravagant imagination and rampant individualism and by the permanency of its principles sustains the thread of continuity through ancient and modern art. Although architecture, sculpture and literature from the time of the Renaissance to the present have been directly influenced by the art of Greece and Rome, the classical spirit has frequently entered other artistic forms, such as painting and music, which have experienced no direct contact with antiquity. Whatever art reveals a fine rationality and mastery of form, an adherence to principles set above individualistic caprice, is justly called classical whether it can discover its like in the ancient world or not.

CLAUSEWITZ, CARL VON (1780-1831), Prussian general. In 1815 he was chief of staff of an army corps and in 1831 chief of staff of an observation army concentrated on the Polish border. In the intervening period (1818-30) he served as managing director of the Military Academy at Berlin. During these years he wrote his famous treatise on war, published posthumously in incomplete form.

Together with Jomini, Clausewitz worked out the theoretical principle of the new strategy employed by Napoleon. According to this principle the proper aim of military operation should be the destruction of the enemy's combatant forces rather than wearing him down through manoeuvring and siege. Clausewitz' doctrine of the necessity of concentrating the offensive exclu-

sively on the field forces dominated the entire nineteenth century, influencing the strategic thinking of the Prussian general staff even after the American Civil War and the Franco-Prussian War had shown that victory in the field was no longer sufficient to place the victor in a position to dictate peace.

Other phases of Clausewitz' strategy, in which he differed from later German theorists, are not so well known. He emphasized the interdependence of warfare and politics, assigning the primacy to the latter and by implication subordinating the general to the statesman. He advanced the idea of the superiority of the inner line of operation over the outer, with its corollary that the object of an offensive should be to break through the enemy's center rather than to envelop his flanks. He insisted on the superior strength of the defensive position as such and drew up formulae for determining the offensive superiority required for crushing a given defensive strength.

Piltcher as *War According to Clausewitz* (London 1918), *Politische Schriften und Briefe*, ed. by Hans Rothfels (Munich 1922).

Consult: Schwarz, K., *Leben des Generals Carl von Clausewitz*, 2 vols. (Berlin 1878); Cuemmerer, Rudolf von, *Clausewitz* (2nd ed. Leipzig 1905), and *Die Entwicklung der strategischen Wissenschaft im 10. Jahrhundert* (Berlin 1904); Rothfels, Hans, *Carl von Clausewitz, Politik und Krieg* (Berlin 1920).

CLAY, HENRY (1777-1852), American statesman. Clay, Webster and Calhoun constituted the "great triumvirate" which for a generation before 1850 exercised a dominating influence upon federal legislation and American political thought without being itself agreed upon many matters of public policy. Clay represented Kentucky in the Senate or House of Representatives almost continuously from 1806 until 1825, from 1831 until his resignation in 1842 and again from 1849 until his death. He was three times speaker of the House. As a recognized champion of the economic interests and nationalistic feeling of the new West and as leader of the "war hawks" he urged war with England in 1812. As one of the commissioners to negotiate the Treaty of Ghent (1814) he opposed opening the Mississippi to England in exchange for the Newfoundland fisheries. His support of Adams in the presidential contest of 1824 led to the charge that his subsequent appointment as secretary of

state was the result of a "corrupt bargain" with the Adams supporters. His principal interest as secretary of state was in the new states of Latin America, but the general outcome of his diplomatic efforts was disappointing. As early as 1820 he began the elaboration of an "American system" whose chief elements were tariff protection for young industries and federal aid for internal improvements. South Carolina's attempted nullification of the tariff acts of 1828 and 1832 forced him to modify his protectionist views; the compromise tariff of 1833 was largely his work. His support of the bill to recharter the Bank of the United States led to his defeat as a Whig candidate for the presidency in 1832. The proposal to distribute the surplus revenue among the states had his support, but he opposed the establishment of an independent treasury system in 1838 and broke sharply with President Tyler over the bank question. His attitude toward slavery contributed greatly to his popular title of "the great compromiser": although he had favored the gradual emancipation of slaves in Kentucky he opposed the restriction in Missouri and was influential in framing the compromises of 1820 and 1821 under which that state was admitted. Although he regarded abolition as "a delusion which cannot last" he opposed both Texan annexation and the Mexican War and was the principal author of the compromise legislation of 1850.

WILLIAM MACDONALD

Works: Federal edition, 10 vols. (New York 1904).

(New York 1916); Burton, Theodore E., "Henry Clay" in *American Secretaries of State*, ed. by S. F. Bemis, 10 vols. (New York 1927-29) vol. iv, containing bibliography.

CLEARING HOUSES are devices of organized society to effect economy and simplicity in exchange. The clearing principle is one of the notable manifestations of the effort of human beings to simplify procedure in the different kinds of exchange which characterize highly developed societies. It may function through organizations of the most varied form, ranging from the informal and temporary to the highly organized and permanent. It may cover the interchange of information, such as credit and employment, or the settlement of financial claims between two or more parties. In the latter case the various claims, such as those arising from the interchange of freight cars and the sale

of securities, are offset against each other so as to leave only net differences to be paid. Since so large a proportion of human activity is related to such common media as money and credit, the latter particularly in commercially advanced countries, the clearing device is most spectacular and effective when used to simplify the exchange of such instruments. The outstanding examples of clearing, therefore, from the standpoint of importance, permanence and efficiency, are the modern clearing houses established by banks to facilitate the settlement of their claims against each other.

The clearing principle as applied to the monetary media of exchange is not of recent origin. It has been contended that it was used in Florence as early as 800 A.D. and in Tokyo as early as 2600 B.C. At any rate it is certain that the principle had attained a high degree of perfection at the fairs of Lyons by 1463, and knowledge of the methods used at Lyons was widespread in Europe by the eighteenth century. The first modern clearing house was probably that in London, which took definite form in 1773, although some authorities say the Edinburgh clearing house dates from 1760. Dublin followed in 1846; New York City, 1853; Paris, 1872; Vienna, 1872, although some local banks cleared as early as 1864; Berlin, 1883; St. Petersburg, 1898. In the United States there were but six clearing houses in existence at the outbreak of the Civil War, organized in the following years: New York City, 1853; Boston, 1855; Philadelphia, Baltimore and Cleveland, 1858; and Worcester, Massachusetts, 1861.

The modern clearing house is defined in law as a voluntary association of banks to simplify and facilitate the exchange of such items as checks, drafts, bills and notes, and to serve as a medium of united action upon all questions affecting their common welfare. Most of them are unincorporated, cooperative associations and derive their authority over their members through their written assent to their respective constitutions. In addition to the principal function of clearing most modern clearing houses exercise certain special and secondary functions such as extending loans to the government, rendering assistance to members, fixing rates of interest on deposits, fixing rates of exchange and of charges on collections, fixing reserve requirements, examining member banks, gathering credit data for members, publishing statements relative to clearings and condition of member banks, participating in periodical conferences

and issuing clearing house loan certificates in times of financial stress. Some of these functions have been taken from the clearing house with the establishment of the Federal Reserve system.

In general the modern clearing house clears so-called cash items. The New York Clearing House, for example, clears checks, clean drafts and bills of exchange, all certified items, matured notes and acceptances and (since September, 1926) bond coupons. The clearing procedure is simple and consumes but a few moments. Representatives of the member banks are sent to the clearing house with the items drawn on the other members and at the appointed time each representative presents his items to the other representatives and receives in turn from them the items drawn on his own bank. A balance is struck and the debit balances paid by debtor banks to the creditor banks through the medium of the clearing house. Ordinarily settlements are made by bookkeeping operations, no funds being used. For example, the members of the New York Clearing House carry accounts with the Federal Reserve Bank of New York and at the close of the clearing session the clearing house manager sends a settlement statement to the Federal Reserve Bank directing that the accounts of certain members be debited and others credited. Thus daily clearings which total more than a billion dollars are settled without the actual exchange of any money. Clearing houses differ somewhat in their mode of operation, sessions ranging from one to four per day and settlements being made through bookkeeping operations, as above, by drafts on some bank, by checks drawn on the clearing house, by clearing house certificates or by the use of money.

The system of clearing houses which prevails in a country is conditioned by the type of banking system and reserve structure which prevails. Where central banks exist such banks frequently perform clearing functions. In countries with branch banking, as in Canada or England, clearing houses are relatively few and in general are for the convenience of the parent institutions. Branch banks which carry their reserves with the parent bank send their items to the parent bank for collection, the latter acting as a clearing house for its member branches and as a collecting agent when the items are drawn on other banks. In a country like the United States with its many independent banks the system is less simple, and approximately 350 clearing house associations have developed to take care of the

local clearings. With the coming of the Federal Reserve system the country was divided into twelve districts and a new clearing system was superimposed upon the old. Each of the federal reserve banks now acts as a district clearing house for those banks of its district which choose to use it. For purposes of interdistrict clearing a central agency, the Gold Settlement Fund, was established at Washington, D. C., under the supervision of the Federal Reserve Board. Most of the interdistrict transactions are settled daily through this central fund by means of telegraphic transfers made by the federal reserve banks. Thus the United States has provided the mechanism for a national clearing system, although all banks have not availed themselves of it because of the requirement that all participating banks must remit at par for all checks presented to them.

A complete national clearing system presents the ideal system and secures the maximum economy in the use of all media of exchange cleared. All direct exchanges and collections of credit instruments not preceded by clearing are wasteful and inefficient in procedure. An efficient national clearing system, like that devised for the United States, secures the maximum of economy and speed in collection and transfers with consequent increased safety for all banks; it brings about a wider use of checks or deposit currency; it effects an almost instantaneous transfer of credit from one part of the country to another; it reduces currency shipments to a minimum; it secures the utmost mobility in the use of reserves; and it makes for stability in the national credit structure.

The long established custom of settling inter-country transactions by sterling bills drawn on London has made that city in effect the clearing house of the world. Through this spontaneously developed agency the transfer of gold from country to country has been reduced to a very small proportion of the total international transactions. The creation of a more formal mechanism for minimizing transfers of gold and for making possible a more efficient use of credit upon a given specie basis was probably one of the purposes back of the creation of the Bank for International Settlements, one of whose functions is to establish an international gold clearing system (Young Report, Annex 1, pt. 5). This function has, however, been practically disregarded in the Statutes of the Bank, as adopted by the Organising Committee (Nov. 13, 1929), apparently on the theory that the normal

channels of foreign exchange function sufficiently well.

CLEMENCEAU, GEORGES (1841-1929), French statesman and journalist. Clemenceau was essentially a man of the nineteenth century. By birth he was a gentleman, coming of an old middle class family of the Vendée; yet all his life he retained the manner of the Paris gamin, of the facetious medical student of the sixties holding forth in the internes' clubroom. His political views bore the stamp of the same period: a republican by conviction, he made no distinction between the republic and the *patrie*; an intractable enemy of the Second Empire, he had, nevertheless, a secret weakness for autocratic governments. Above all he was partisan; politics, for him, was the conquest of power, an avid and joyous pursuit in a glorious and ruthless conflict. There was something of the Roman about his patriotism; he had a violent distaste for the mawkish homilies of the pacifists.

These characteristics are the key to his whole career. With the war of 1870 he abandoned medicine and teaching for politics and journalism. In the Chamber of Deputies, to which he was elected in 1876, he joined the group of young republicans who were establishing the new regime under the leadership of Gambetta and Ferry. After 1878, however, when the monarchists had been defeated and the republic

was attaining cohesion and organization, Clemenceau turned radical and Jacobin, becoming the leader of a faction which split from the republican party. Both in the chamber and in the columns of *La justice* he challenged the opportunism of the moderate statesmen and restated their abandoned or compromised ideals: universal suffrage, suppression of the senate, complete separation of church and state, avoidance of colonial ventures. For fifteen years he used his eloquence, devastating as machine gun fire, to bring about the downfall of ministry after ministry. But his path was beset by too many enmities. In 1893 when he failed to secure reelection to the Chamber many believed that his political career was ended. He devoted himself exclusively to journalism until 1897, when he was caught up in the great tide of emotional conflict engendered by the Dreyfus affair. Joining Zola in an impassioned defense of the accused captain, dedicating his newly founded *L'aurore* to the task of securing reversal of the sentence, Clemenceau once more became vitally interested in the affairs of the republic. In 1902 the *département* of the Var elected him to the senate and in 1906 he became minister and premier for the first time in his already long career. The "vieux débutant," as he liked to call himself, took full advantage of the authority of his position and resolutely resisted the miners and other strikers, in whose actions he read a threat to the republic, even though by so doing he incurred the lasting enmity of the more progressive groups. In the Moroccan affair it was he who dared unequivocally to resist the German claims. During the years that followed his resignation from the premiership (1909) Clemenceau labored to keep the French nation alert to the possibility of foreign aggression. In his *L'homme libre* his fulminations against French military inefficiency echoed through the country; and when *L'homme libre* was suppressed *L'homme enchaîné* continued to clamor against the policy of the government. In 1917, when France was at the end of her resources and asked of her leaders only that they hold on, the old warrior, now seventy-six years old, answered the call, succeeding Painlevé as prime minister. He became the symbol of his country's pathetic and tenacious will to survive and in the popular imagination he joined the ranks of legendary heroes: Jeanne d'Arc, Danton, Gambetta. When the time came to make the peace, Clemenceau was named president of the Versailles Conference. But it was a Clemenceau of the nine-

teenth century and not of the twentieth who negotiated the treaty, a Clemenceau who could not forget the war of 1870, who in the face of the idealism which overhung a section of the conference fought stubbornly for security on the Rhineland, indemnification and the maintenance of the old system of alliances. On the morrow of the Versailles Treaty the old "tiger," morose and indifferent to popular acclaim, retired to his home in the Vendée; here he lived in solitude and self-sufficiency, devoting the ten remaining years of his life to study and writing.

CLEMENT OF ALEXANDRIA (Titus Flavius Clemens) (c. 150-c. 215), church father. Clement was born probably at Athens. He became converted to Christianity and after about 200 was head of the famous catechetical school of Alexandria. He elaborated in his *Paedagogus* the first Christian-philosophical ethics; in the religious philosophy of his principal work, *Stromata*, he united the late Greek γνῶσις (knowledge) with the Christian πίστις (faith); and in his homily, *Who Is the Rich Man That Shall Be Saved?* (tr. by G. W. Butterworth in his *Clement of Alexandria*, Loeb Classical Library, London 1919), he gave a conciliatory answer to the earnest question of primitive Christianity regarding the compatibility of riches and faith.

Clement's significance for intellectual history rests upon his acknowledgment of Greek philosophy, especially that of Plato, as preparing the way for Christianity—an acknowledgment which laid the foundation for Origen's crowning work; and upon his demonstration of the already much used conception of the Logos as the firm bridge connecting philosophy and religion. Most important, however, for the social teaching of the church, as later for scholasticism, has been the fact that in opposition to the communistic tendencies which were shown in many writings of the first half of the second century he opened the way for the victory of a moderate, quietistic spirit. Clement, to be sure, was far from interpreting property in the manner of contemporary Roman law as *jus utendi et abutendi*; he himself teaches that property belongs to God and that man has merely the right of enjoyment of it and even this only so far as is necessary. It is not right that some should live in luxury and others in want, and he insists that the greed for profit is the root of all evil. More important, however, and more fruitful of results

was the fact that he no longer upheld as the norm for all Christians an asceticism hostile to society, but pointed out the conditions under which the rich man too might inherit the kingdom of heaven. Thus at the same time entrance into Christianity was made easier for the propertied classes of antiquity and the way opened to an alliance frequent thereafter between church and wealth.

CLÉMENT, AMBROISE (1805-86), French economist. As secretary of the mayoralty of Saint-Étienne, Loire, from 1838 to 1848 and from 1850 to 1860 he applied himself to fiscal problems especially and succeeded in amortizing the city debt and in establishing a surplus. While his office prevented his taking an important part in the intellectual life of Paris, it not only permitted him to study at close range the economics of industry and the life of the working class in one of the busiest sections of France but also exerted a marked influence on his writings.

Clément's early reputation was founded on his *Recherches sur les causes de l'indigence* (Paris 1846). He opposed all forms of socialism and in *Des nouvelles idées de réforme industrielle* (Paris 1848) attacked the national workshops and the doctrines of Louis Blanc. He also objected to state ownership on practical grounds and in his own province successfully blocked the imperial prefect's plan to regulate the grain trade. He was a disciple of the ideologues, especially Destutt de Tracy and J. B. Say, and was strongly influenced by Malthus, Charles Comte and Dunoyer. He was one of the organizers and editors of the *Dictionnaire de l'économie politique* (2 vols., Paris 1852-53; 4th ed. 1873), for which he wrote the introduction. He also contributed to the *Journal des économistes*.

His principal writings, in addition to those mentioned above, are *Essai sur la science sociale* (2 vols., Paris 1867) containing three treatises on economics, experimental ethics and rational politics; *Le bon sens dans les doctrines morales et politiques* (2 vols., Paris 1878); and *La crise économique et sociale en France et en Europe* (Paris 1886), his last work, in which he sums up his arguments against excessive public

expenditure, protectionism and socialism. Clément's contribution to nineteenth century economic thought is creditable but unoriginal.

ROGER PICARD

CLÉMENT, JEAN-PIERRE (1809-70), French historian and economist. Clément, who was employed in the department of finance, undertook a series of studies of French ministers and superintendents of finance. He became especially interested in Colbert, on whom he wrote a series of articles which were published in the *Correspondant* and later collected in a volume entitled *Histoire de la vie et de l'administration de Colbert* (Paris 1846). The work was crowned by the Académie Française. In 1859 he was commissioned by the government to collect and publish Colbert's papers, a formidable enterprise which was to occupy the greater part of his life. In all, ten volumes appeared under the title *Lettres, instructions et mémoires de Colbert* (Paris 1861-82, the two last being published posthumously). The introductions to each volume, which form in themselves a complete study of the work of Colbert, were published separately as the *Histoire de Colbert et de son administration* (2 vols., Paris 1874). At intervals Clément published a series of works on the history of the reign of Louis XIV and of French financial and economic policy, of which the more important ones are *Le gouvernement de Louis XIV de 1683 à 1689* (Paris 1848), *Jacques Coeur et Charles VII* (2 vols., Paris 1853), *Histoire du système protecteur en France* (Paris 1854), *Portraits historiques* (Paris 1855), *La police sous Louis XIV* (Paris 1866), *Madame de Montespan et Louis XIV* (Paris 1868), and *Une abbessé de Fontevault au XVII^e siècle* (Paris 1869).

He had been appointed a member of the Académie des Sciences Morales et Politiques when a section for politics and administration was created in 1855. Although not very active politically, he was for many years a member of the general council in the department of the Var.

As an economist Clément was an ardent advocate of free trade. This, however, did not prevent his admiring the work of Colbert. He recognized the contribution which Colbert's system had made toward putting France in the front rank of manufacturing countries, but he questioned its advantages for national well-being in general and for the agricultural class in particular. In his *Histoire du système protec-*

teur en France he advocated a progressive downward revision of the tariff for the benefit of the people as a whole. He was primarily a careful, documentary historian whose works are models of critical erudition.

CLERICAL OCCUPATIONS. The term clerical occupations is now used to denote a large variety of office positions other than those of an executive or professional nature, most of which involve writing, computing or record keeping. These supplement the conduct of industry, business, education, public administration, scientific research and the dissemination of literature and news.

The existence of a special professional group of copyists and correspondents preceded the designation of clerk. Assyrian monuments as early as the eighth century B.C. and Egyptian reliefs of remote dates portray scribes writing or copying on tablets, leather or papyrus rolls. Toward the end of the fifth century B.C. the Athenian book trade, catering to a wide reading public, employed large numbers of scribes, who were usually slaves. The use of papyrus rolls which were not durable, except in very dry climates, made it necessary continually to prepare new copies of the outworn books. The largest and most learned group of copyists ever assembled were those employed in the great libraries of Alexandria from the second century B.C. Rome not only developed a book trade but at the beginning of the fourth century A.D. boasted a number of public libraries which required the work of scribes. Professional scribes were employed by the illiterate lower classes for business as well as for personal correspondence. The affairs of government at all times necessitated the employment of clerical assistants.

The term "clerk" (*clericus*) itself goes back to the mediaeval "clergy," which was a collective name for the body of clerks who had taken holy orders. Its origin dates from a period when education was the prerogative of the men in the church. The great monastic orders of the Middle Ages set themselves the task of copying, on the more durable vellum codex, documents considered of value for monastic education. In the scriptorium of the monasteries the clerical monks sat hour after hour at their sloping desks, or *carolas*, busy with the transcriptions which were later to be corrected by the best scholars of the

monasteries. The elaborate illumination of the text was, however, most often the individual contribution of the humble clerk. These clerical monks also compiled the monastery's chronicle, a compendium of useful information which often began with the creation of the world and extended to details of the recent history of the realm and of the immediate neighborhood. England owes much of the valuable source material of her history to the industry of the clerical monks.

Eventually, a "clerk" came to be any man who followed an occupation requiring writing. Clerks were used during the Middle Ages in connection with the business of the great secular feudal estates. The bailiff's roll, or annual balance sheet, contained a record of the receipts of rents and the outlays for expenses. As late as the thirteenth century the use of Roman numerals and other intricacies involved in the computation of these records necessitated specialized clerical assistance. Towns, parishes and other public bodies employed clerks.

As industry came into the control of the great craft and merchant guilds the employment of clerks increased. With every expansion in the character and scope of commerce, industry and public affairs the number of clerical workers increased. Very little change, however, in the character of the occupations themselves may be discovered before the last quarter of the nineteenth century. Although the invention of printing in the fifteenth century resulted in increasing rather than diminishing the number of clerks required, the nature of their tasks remained the same.

The introduction of the typewriter into the United States in the seventies marks the begin-

ning of a series of other inventions for duplicating, computing, compiling, dictating, folding, addressing and the like, as well as of innovations in office practise. Concurrently there was a displacement of the small individual enterprise by the corporation and the trust as the dominant units in industrial and business life. These changes have resulted in a great increase in the number of men and women in the clerical occupations, in their congregation into larger units and at the same time in the increasing mechanization of their work. The following table shows the increase in the total number of clerical workers from 1910 to 1920, as well as increases in the various subdivisions recognized by the United States census bureau as comprising the group. These figures include government employees, whose problems, since they differ in important respects from those of non-government employees, are discussed elsewhere.

The three million odd clerical workers in 1920 show an increase of more than 80 percent over 1910. An even more striking increase, both relatively and absolutely, is shown in the figures for the number of women. For the occupational group as a whole, women represented 45 percent in 1920 as compared with 34 percent in 1910, less than 30 percent in 1900 and 6 percent in 1880. Men had long been in the majority in each of the subdivisions with the exception of stenographers and typists, among whom in the last decade women have predominated. The more rapid rate of increase of women greatly reduced the majorities of the men in the other subdivisions. In the subgroup of clerks, for instance, women in 1920 comprised a third as compared with about a sixth in 1910, an increase greater than in any other occupation reported by the

PERSONS 10 YEARS OF AGE AND OVER ENGAGED IN CLERICAL OCCUPATIONS IN THE UNITED STATES

OCCUPATION	1920			1910		
	TOTAL	MALE	FEMALE	TOTAL	MALE	FEMALE

Source. Fourteenth Census of the U. S. 1920, vol. 1 occupations, p. 43, Table A.

census. Women clerks increased almost fourfold within the last decade.

It is within this largest subgroup of clerks, numbering in 1920 a million and a half, or almost half of the total occupational group, that some of the most drastic changes leading to mechanization and the introduction of woman labor have taken place. Women perform tasks which were either new or unknown at the beginning of the century.

The above table reveals the wide variety in the character of the work performed by clerical employees. This has most often been accompanied by a correspondingly wide range in the pay received. According to a study made in 1926 by the National Industrial Conference Board covering 27,000 employees in 427 companies the median weekly salary rate varied from \$15.38 for mail clerks to \$49.87 for chief clerks. Only when combined with administrative responsibility is clerical work well paid. According to the same study median weekly salary rates for general clerks were \$19.38, for senior stenographers \$27.47, for head bookkeepers \$41.34. In the group of occupations most characteristic of office employment the average salary rate was close to \$25 per week, as compared with weekly average earnings of \$27.27 given by this same body for manual workers.

The gradation in tasks and salaries has helped to uphold the lingering tradition that the clerical occupations, in addition to affording more congenial work, shorter hours, vacations with pay and similar advantages, offer not only greater social prestige than factory labor but provide stepping stones to better positions. These advances presumably extend into important executive and technical positions. Such compensations are held to outweigh the small salaries of particular occupations.

Recent studies of wages and of working conditions in terms of hours, occupational hazards, economic security and opportunities for advancement tend to show that the shadowy line between many of these clerical tasks and unskilled factory occupations is becoming more and more imperceptible.

There still exists, of course, the small office in which the clerk, bookkeeper or stenographer finds in the variety of his daily work and in the opportunity for initiative and advancement compensations for a comparatively low salary. The proportion of such workers is small. The majority of clerical workers is concentrated in

large units, attached to vast industrial commercial enterprises, in which mechanization has taken place in all branches of work from that of the file clerk to the more highly skilled bookkeeping and stenographic branches. The subsequent specialization and subdivision, involving physical segregation and precluding the possibility of advancement from one task to the other, have transformed most of these occupations into blind alley jobs. According to a study made recently by the American Management Association one large firm reported that over 80 percent of its clerical force did not expect promotion to other positions.

The technical aspects of mechanization as well as the problem of its immediate enforcement in office practise have been studied by industrial engineers. They have recommended the broader application of such methods as the introduction of piece work and of production standards often mechanically controlled, as well as of practises leading to the virtual elimination of individual initiative. This trend has aroused but little articulate comment either from the workers or from those in charge of business education or from students of labor problems.

The statement that office work is very much less injurious to the health than factory employment has also been challenged by some recent studies, which show that defects in systems of ventilation, illumination and seating arrangements are by no means uncommon and that morbidity and mortality rates are not low. The percentage of male office workers (unadjusted for age groups) suffering from tuberculosis is exceeded only by that of soldiers, sailors, miners (other than coal) and pottery workers. The average length of life of male office workers is computed at thirty-nine years.

It is probably true, however, that since their rate of turnover is lower office workers enjoy greater economic security than factory employees. This may be due in part to the greater docility of the clerical worker and to the selection, through elaborate systems of hiring, of workers likely to be stable. As their numbers increase, however, clerical workers are more and more likely to be subject to the incidence of cyclical fluctuations, especially in view of the steadily increasing oversupply of office workers turned out by the schools. The older men and women find the same difficulty in maintaining and securing employment as in factory occupations.

Supposed advantages in shorter working

hours have in some instances been more than counterbalanced by unregulated and excessive overtime. Moreover, the margin of difference is being cut into by the increasing number of organized manual workers who have won the five-day week and the shorter working day. In a study covering 304 establishments employing 174,000 clerical workers the average working day was 7 hours and 40 minutes, while 106 plants worked an eight-hour day and 25 plants more than an eight-hour day.

It has often been observed that members of the salaried class have an advantage over wage earners in that their earnings in times of depression are not reduced as soon or as much as those of wage earners. On the other hand, they have a corresponding disadvantage in that their salaries in times of prosperity are increased so slowly that they often fail to keep pace with the rising cost of living. According to Professor Paul H. Douglas the salaried and clerical workers in the United States in 1926 were "only 3 per cent better off than they had been during the nineties," which, he comments, is "particularly striking in view of the 29 per cent gain made by the manufacturing wage earners."

No form of organization has arisen among the clerical workers, with the exception of those in government offices, the railway and steamship clerks and a few hundred employees of labor unions. All three of these groups have received some external stimulus to organization. The railway clerks have been particularly successful, their number reaching almost a hundred thousand in 1929, of whom about one third were women. The existence of strong national unions and national collective agreements in other branches of the railway industry accounts in part for the railway clerks' organization. Another factor, which holds for governmental employees as well, is the large role of regulatory legislation, for the securing of which organization is necessary. With the exception of the activities of these three groups efforts to improve working conditions have in the main come from the employers. Workers' participation in any form of employee representation has been passive. Welfare activities, involving recreational facilities, lunchrooms and the like, have a vogue among clerical employees, particularly where women are in the majority. From time to time spasmodic organizing campaigns in the larger cities have been carried on among employees of banks and large insurance companies. Although the response in membership has been

negligible, the agitating groups have claimed that their efforts have brought about increases in wages.

The indifference of the clerical worker to unionism or to any other form of collective organization may be explained by a number of factors. The greater number of women, especially younger women, workers, new to the problems of economic organization, has increased the difficulties of unionization. Most fundamental, however, is the old prejudice of the white collar worker against being identified in any way with the manual worker. The persistence of the belief that clerical occupations present opportunity for advancement may be accounted for by the fact that the number gaining promotion, although a decreasing one, is still much larger than among factory workers. The terminology of clerical employment confirms the assumption of superiority: clerical workers earn salaries, not wages; they go to business, not to work; their positions (not jobs) are in offices, not factories.

The situation of the clerical worker in Great Britain resembles in many respects that of the American clerk. Although clerks were persons of only minor social importance before the eighteenth century, the rise of the middle class in England caused occupational status to become far less rigid. Thus the career of Robert Clive, who had been a mere clerk in the employ of the East India Company and who attained a position of great wealth and influence, may be taken as symbolic of a development in which an amazed society saw the "clerks of yesterday become the capitalists of today." Beginning with the fifties, clerical occupations for women were highly recommended by leaders of the women's rights movement and a conscious effort was made to introduce women into the civil service. The "black-coated proletariat" of England enjoys still a feeling of social superiority to the factory operative.

In 1921 there were about a million and a half clerical workers in Great Britain, of whom a quarter of a million were government employees. Although British office practise has by no means undergone such mechanization and specialization as American, tradition operates against advancement of clerical workers. The economic status of the British clerical worker, especially since the war, is probably lower than that of the American. Various special bills for safeguarding the health and improving the working conditions of clerks in private establishments, in spite of the great need for such legislation.

have been defeated in Parliament. The antipathy of the British clerk to unionization stands out in contrast to the British workingman's high degree of organization. In the first flush of the "new unionism" at the beginning of the twentieth century a national union of clerks was formed. During the war its membership exceeded 40,000, but in 1930 it had dwindled to less than 7000.

In the countries of continental Europe clerical workers have responded to labor unionism, and largely through their efforts measures regulating hours and wages and laws providing social insurance have been specially enacted for their benefit or have been so drawn as to include them.

Austria has been called the cradle of clerical unionism. The largest labor union membership of clerical workers, however, is in Germany. A rich literature is available concerning the status of the *Angestellten*, the term now distinguishing those in private employ from the *Beamten*, or government employees. It has been estimated that the number of clerical workers has risen from half a million in the eighties to two million in 1907 and to perhaps more than double that number in 1926. Of the non-government employees 400,000 belong to trade unions affiliated with the "free trade" union movement and with the Amsterdam International. Another large group is affiliated with the Hirsch-Duncker national organization, a third with the Christian labor unions; some scattered thousands are organized in unaffiliated neutral, or "yellow," groups, while a small number are communist in allegiance. Unionization came later among the clerical than among the manual workers. Incentives to organization may have been the desire for recognition in the extensive social legislation enacted in the nineties for other working class groups and the opportunity to participate in the political labor movement. In some instances it may have been the desire to keep pace with the industrial workers that aroused group consciousness.

The number of clerical workers in European countries is increasing. They now form more than 10 percent of the working population, as compared with 6 or 7 percent in 1906 or 1907. The wide influence in all countries of American business methods, added to the failure of clerical workers everywhere to maintain their economic status, has aroused considerable concern. Recently in Chile legislation enacted to protect clerical workers, of whom a great

number are in the employ of American capitalistic enterprises, has been far reaching in scope, prohibiting the use of "yellow dog" contracts and providing for joint insurance funds and the like. The International Labour Office began in 1928 a series of conferences looking toward the international regulation of the hours of salaried employees in response to the growing concern for their poor economic status.

CLERMONT-GANNEAU, CHARLES (1846-1923), French epigraphist and archaeologist. In 1867 he was appointed dragoman at the French consulate in Jerusalem. After fifteen years in the consular and diplomatic service in the Near East he returned to France, where until 1906, when he retired with the honorary title of *ministre plénipotentiaire*, he combined

diplomacy with research and teaching. In 1890 at Renan's request the chair of Semitic epigraphy was established for him at the Collège de France. Both the French government and various English and French groups interested in archaeology commissioned him on several occasions to undertake archaeological expeditions to the Near East.

During Clermont-Ganneau's lifetime and largely through his own work Palestinian archaeology and epigraphy developed from scanty collections of useless material into exact sciences. After his initial good fortune in discovering the Mesha Stone, the most important written monument ever found in Palestine, he entered upon an uninterrupted series of brilliant archaeological, epigraphic and topographic discoveries, in which he displayed unusual linguistic erudition together with sound philological method and extraordinary archaeological flair, a combination of qualities which has been unsurpassed by any other oriental archaeologist. One of the sensational by-products of his career was the unmasking of the most notorious forgeries of the nineteenth century, the so-called Moabite antiquities, which had deceived the German archaeologists, and the "archetype manuscript of Deuteronomy," which had been offered to the British Museum for a fabulous price. Most of Clermont-Ganneau's papers and monographs are collected in *Études d'archéologie orientale* (2 vols., Paris 1880-92), *Recueil d'archéologie orientale* (8 vols., Paris 1888-1923) and *Archaeological Researches in Palestine* (2 vols., London 1896-99).

CLEVELAND, STEPHEN GROVER (1837-1908), American statesman. Four years after his admission to the New York state bar in 1859, Cleveland became assistant district attorney of Erie county and subsequently served as district attorney and sheriff. In 1881 he was elected mayor of Buffalo on a reform ticket. He attracted considerable attention by the thoroughness with which he carried out the reform program and in the following year, partly as a result of this reputation, was chosen to the governorship of New York on the Democratic ticket. During his administration he became nationally prominent

by his stubborn honesty, his defiance of Tammany and his blunt way of dealing with public questions. Nominated for the presidency in 1884 he defeated Blaine in a campaign which brought him warm support from reform elements, and in the following year he organized in Washington the first Democratic administration since before the Civil War.

Cleveland's eminence is that, not of an aggressive reformer in the Rooseveltian or Wilsonian sense, but of a conservative statesman who was unflinching in his adherence to principle. A man of limited intellect and foresight and yet endowed with clear immediate vision, he pursued a ruggedly direct course. In his first administration he alienated many of the party politicians by resisting the extreme demands of the spoilsmen for office and by his support of civil service reform (which he enlarged still further in his second administration); insisting upon the independence of his appointive power he forced Congress to repeal the Tenure of Office Act. A still larger section of his party was alienated by his vigorous opposition—culminating in his veto of the first general pension bill of 1887—to the practise of indiscriminate granting of Civil War pensions. Becoming convinced of the unfairness of the high protective tariff, which in addition, by piling up a large treasury surplus, was proving a source of embarrassment to the administration, he devoted his entire message of December, 1887, to an attack upon it. Renominated in 1888 he gained a popular plurality but lost the election to Benjamin Harrison. Nevertheless, his tariff message proved a successful stroke. The congressional elections of 1890 were a sweeping popular repudiation of the excessively high McKinley tariff, which had been passed in that year; and in 1892, running against Harrison in a campaign dominated by the tariff issue, Cleveland won a decisive victory. His second administration proved one of the most troubled in American history and was, in spite of his undeviating devotion to sound principles, to a certain extent disastrous. One of his most painful disappointments was the defeat of his low tariff policy, which had been endorsed by the country in two national elections. By means of lobbying and logrolling and by an alliance between the Republicans and a small group of protectionist senators of Cleveland's own party under the leadership of A. P. Gorman, his opponents were able to carry through the unsatisfactory Wilson bill, which Cleveland de-

nounced and allowed to become law without his signature. The financial problems of the second administration were strikingly different from those of the first. The president was embarrassed, no longer by a surplus, but by an acute shortage which had been gradually produced by heavy expenditures under President Harrison and by the effects of the Sherman Silver Purchase Act of 1890 in draining the treasury of its gold. In the severe crisis precipitated by the panic of 1893 Cleveland was finally successful, although at the cost of permanently alienating the great body of free silver Democrats, in saving the government from bankruptcy. He compelled the repeal of the Sherman Silver Purchase Act, rescued the treasury by the desperate remedy of four bond issues and sustained the capacity of the government to continue its gold payments. To restore order in Chicago following the violent Pullman strike disturbances of 1894 he secured a federal court injunction against the strikers and by sending federal troops maintained the national government's right of intervention. Although he resisted the annexation of Hawaii and refused to be driven into war with Spain over the insurrection in Cuba, he emphatically asserted the interest of the United States in an equitable settlement of the Venezuelan boundary and forced Great Britain to recognize the implications of the Monroe Doctrine. So unpopular were many of his acts that during his last year in the White House he was left in political solitude, but he accepted doggedly the penalty for his inability to compromise. Cleveland lived long enough to witness a general public recognition of his civic heroism. He will be remembered for some of his specific policies, but much more for the example he gave of unflinching adherence to his ideal of public duty, which, although sometimes narrow and unimaginative, was always conscientious.

CLICQUOT-BLERVACHE, SIMON DE (1723-96), French economist. Both before and after his appointment as director general of manufactures and commerce in 1766 he wrote a number of tracts dealing with matters of economic policy. He was fundamentally an economic liberal, although caution occasionally impelled him to favor moderate internal regula-

tion or more drastic regulation of foreign trade. In the most notable of his works, *Considérations sur le commerce et en particulier sur les compagnies, sociétés et maîtrises* (Amsterdam 1758), which according to Dupont de Nemours was written "under the supervision and with the advice of Gournay," he traces the history of the guild system in France, analyzes its effects and concludes by advocating its abolition. His attention was directed primarily toward commerce and industry, but he was careful, in that age of physiocrats, to give adequate recognition and consideration to agriculture. In order to encourage the peasant class in a kingdom where he saw "many trades and few ploughs" he suggested such changes as the reform of the *taille* and the suppression of all feudal dues (*L'ami du cultivateur*, 2 vols., Chambéry 1780). In general he was inclined to accept the rural policy of the physiocrats, with the reservation that consumers' interests must be safeguarded. Clicquot-Blervache's other works include: *Dissertation sur les effets que produit le taux de l'intérêt de l'argent sur le commerce et l'agriculture* (Amiens 1755), in which he called for legislation to reduce the interest rate, a policy of which he later perceived the fallacy; *Dissertation sur l'état du commerce en France depuis Hugues Capet jusqu'à François I* (Amiens 1756); *Essai sur le commerce du Levant* (unpublished); *Éloge de Sulzy* (unpublished).

CLIMATE. *The Climatic Regions of the World.* Because of the recurrence in the several continents of similar relationships between land, water, wind direction and distance from the earth's equator it is possible to define type climates which serve an important purpose in the science of climatology. Since the earliest times the device of type climates has been employed, but until recently the definition of types has been loose and misleading. Thus the term "torrid zone" is descriptive of neither land nor climate, for the area so designated contains deserts and swamps, thick hot forests and bleak cold plateaus. The continental designations, as "Africa" or "Europe," are equally non-descriptive. But "tundra" or "equatorial forest" are definite descriptive terms. Excellent climate maps constructed on scientific lines are now available. Among them that of W. P. Köppen (to be found in Petermann, A., *Mittheilungen*, ed. by P. Langhans, vol. lxiv, 1918, p. 240) is a

marvel of completeness but is too complicated for the purposes of the present discussion. The accompanying maps are based on the classification of A. J. and F. D. Herbertson (*The Senior Geography*). By means of such charts a more adequate knowledge is obtainable of the typical climates of the world and of their relation to some of the elements of civilization.

The wet equatorial lowland or Amazon type (4c) is a climate with sufficient heat and humidity to produce a thick forest with dense foliage and huge tree trunks. When the forest is cleared an impenetrable jungle quickly springs up. This is the land of palms, bananas, cassava and rice and covers large areas in South America, Africa and the East Indies.

The summer rain or Sudan and monsoon types of climate (4b) are found in tropic grasslands marked by frequent and heavy rains which alternate with months of drought. In the wetter areas near the equator these lands are covered with tall grass interspersed with trees, forming a landscape called savannah. The amount of rainfall decreases with distance from the equator, and grass and trees become progressively scarcer until the grassland tapers off to sparse scrub and bunch grass and finally, in Africa, merges into the deserts of Kalahari and Sahara. In Asia the great land mass of the continent heats up in summer, causing the air to become light; the barometer falls and there is great indraft of wind from the seas. This summer wind is called a monsoon. India has a monsoon type of climate. In Australia the smaller land mass located, like Asia, just outside of the equatorial belt produces a similar summer season but one not so strongly

developed as that in the more gigantic Asia. In these tropic grasslands the rainfall is much more irregular as to both quantity and time than it is in Europe. As a result wild animals must struggle for the water hole and man must deal with the recurrent problem of famine. The tropic grasslands of South America are almost entirely uninhabited, a condition due not to whim or accident but to irregularity of rainfall. Within recent years the complete failure of crops in the Brazilian state of Ceará, just north of the east point of Brazil, caused most of the population to move to the seacoast to be fed for a season at government expense.

The lofty plateau or Bolivian type of climate (4d) is found in the Andean and Tibetan plateaus. These are lands of cold dry pastures with patches of potato and hardy cereal tillage.

The western desert or Sahara type (4a) is hot and dry. It is found on the western margins of continents in latitudes of twenty to thirty degrees and these regions have deserts immediately upon the shore of the sea.

Warm temperate, western margin or Mediterranean climate (3a), lying poleward from the desert areas, is as systematically distributed as is the desert type. Rain falls only in winter, when plants cannot make the best use of it. The winter rain is accompanied by temperatures usually above freezing, and grass, wheat, barley and other hardy plants may grow through this season. The grass and flowers of early spring are followed by a summer of shimmering heat, dead grass, bare fields, hazy atmosphere and a mantle of dust. Mountains are extremely important in regions with Mediterranean climate because

they catch and hold the winter snows and furnish water for the irrigation of the low plains that are otherwise dry in summer, as in California, Chile, Australia, the *huertas* of Spain, the orange orchards of Sicily and the coasts of Palestine.

Warm temperate, eastern margin or China type of climate (3h) is found in areas in the same latitude as those having the Mediterranean type, but on the eastern side of continents. These areas have abundant summer rains, thus providing vegetation with heat and moisture at the same time. Of the six areas which have this climate the Asiatic, peopled by the Chinese, the Japanese and the Koreans, supports greater populations than any other. Southeastern United States, with about 700,000 square miles of this type of climate, is one of the great potential food reserves of the world. The South American, the African and the Australian areas are much smaller, not so well supplied with rain and attached to large tropical land areas from which locusts, boll weevils and other pests come to ravish and destroy the crops.

Warm temperate, interior lowlands or Turan type (3c) and plateau or Iran type (3d) are found in America and Eurasia where there is some lowland, like the plains of Turkestan, or where there are wide areas of land of little rain and some high land, like the adjacent plateau of Iran. These are lands of pastoral nomads in the Old World and of cowboys and ranches in the New. They are also lands where mountain streams furnish water to irrigate lowland spots and to support the urban centers, such as Samarkand, Tehran and Salt Lake City.

Cool temperate, western margin or west European climate (2a) is found poleward from the Mediterranean type, on the west coasts of continents. These areas, with their frosty winters and cool summers well suited to maturing crops of wheat, barley, rye, oats, potatoes, beets and various clovers, have one of the best of all climates for man. The white races seem better adapted to the temperature of this region than to that of any other which affords an abundant food supply. Europe opens a plain to the ocean at forty to fifty degrees north latitude, permitting a wide extension of this climate into its interior. Scandinavia and Alaska may preferably be considered as a separate type. In North and South America, with their western mountain walls, this type of climate is restricted to narrow coast lands where agricultural land is limited to a few thousand square miles. There is no climate

of this type in Australia, but Tasmania and New Zealand offer a fair counterpart to the British Isles.

Cool temperate, eastern margin or Laurentian climate (2b) has the latitude of the west European, but the winters, both in Asia and in North America, are very cold and the land is buried deep in snow. Rye, oats and potatoes are grown in this region. Patagonia, the South American land with this Laurentian climate, suffers from drought because the Andes shut it away from the moisture bearing winds of the Pacific. A large proportion of the 2b areas and also of the 2c areas is too cold for agriculture but nevertheless permits coniferous trees which sweep in a wide belt around the north pole in Siberia, Russia, Sweden, Norway, Newfoundland, New England, Canada and Alaska—all lands of the fur hunter.

Cool temperate, interior lowlands or Siberian climate (2c) is found in North America and Eurasia where the land is low and cut off from the sea. This continental climate is extreme—hot in summer, cold in winter. The influence of ocean and continent in differentiating climates in similar latitudes is well shown by comparing the London January average of 38.7° F. with the January average of —15° F. directly eastward in Siberia. The ocean that keeps London warm in winter keeps it cool in summer, affording it a July average of 63.1°, while the July average in Siberia is 74°. North America shows similar contrasts. This continental interior climate has light snows and a maximum of rain in summer. It is this climate which, if warm enough, fosters spring wheat, oats, barley, flax and in moister places the potato and the sugar beet.

Cool temperate, interior highland or Altai type of climate (2d) in the higher lands in the interior of continents contains large areas of upland forests, rock, snow and summer pastures.

Polar lowland or tundra climate (1a) is found in the wide area of lowland facing the Arctic Ocean. This low, treeless plain is called the tundra. It is frozen for nine or ten months of the year and wet and slushy during two or three months of partial thaw. The tundra is the home of the reindeer and of a few reindeer peoples; of the rabbit, fox, wolf and of waterfowl which go there for the summer nesting period and migrate to the tropics in winter.

Polar highlands or ice cap climate (1b) is found in Antarctica and in Greenland. The polar ice caps cover all arctic highlands for three or

four million square miles in Antarctica and half a million square miles in Greenland.

These climates have not always occupied their present areas. In the glacial epoch the areas between the arctic tundra and the equatorial forest were compressed within much narrower limits. There is also much evidence to indicate that even during the time of man there have been variations in rainfall as well as in temperature that have caused the boundaries of climatic regions to shift back and forth across marginal zones many miles in width. These differing amounts of rainfall have been a factor in causing variations in natural vegetation, animals, crops and human cultures in given locations.

The Study of Weather. The rainmaker is an important man among primitive peoples. He is found in almost every climate where drought harasses mankind, especially in Australia, the grasslands of Africa (although he is absent from the forest), parts of Russia, Central America and in southwestern United States, where the Zuni and other tribes living in the less arid spots of Arizona and New Mexico perform a most elaborate ritual to bring rain. Ritual and prayer for rain are, in fact, almost universal. Homer attributed the changes in the wind or weather to the direct action of the gods, and Biblical authors ascribed them to the Deity. It has long been known that the weather follows fixed laws. Yet the primitive and pious belief in the reversal of these laws by the special intervention of deity still persists. During periods of drought in various parts of the United States many thousands join in prayer for rain.

No successful artificial rainmaking technique has as yet been devised. Men can at present merely predict the weather to a limited extent by the careful observation and study of atmospheric changes. Weather prediction is a very ancient art. Primitive man made and still makes predictions about the weather and every civilization has developed its weather proverbs. Aristotle made a formal attempt to study the subject, but his field of observation was small and his method poor. His pupil, Theophrastus, published in his *On Winds and on Weather Signs* (tr. by J. G. Wood, ed. by S. J. Symons, London 1894, §§ x-xii) in the fourth century B.C. an elaborate exposition of weather lore, giving eighty different signs for rain, for five for wind, fifty for storm, twenty-four for fair weather and seven for the weather for periods of a year or less. Vergil, in the *Georgics*, bk. i, prevents a notable collection of weather signs for the

guidance of husbandmen. Many of the signs and sayings recorded by Theophrastus and Vergil are still the guidance of the uneducated of Europe and America. Mediaeval England added items appropriate to a weather with summer rain. The American weather lore is the European tradition with modifications. The United States Weather Bureau has recently collected and published many interesting items of weather lore.

After Aristotle there was no advance in the study of weather and climatic conditions for nearly two thousand years. Around 1600, however, Galileo invented the thermometer and in 1643 Torricelli invented the barometer. With these instruments of precision meteorological science began to progress. By 1659 Robert Boyle had used Toricelli's barometer to discover some important facts about the pressure and masses of air, so that within another decade barometers could be made with signs much as at present: "change," "rain," "fair," etc.

In the first half of the eighteenth century Edmund Halley presented the hypothesis of the general circulation of the atmosphere with a zone of ascending air at the equator as an important element. Shortly after this George Hadley worked out the theory of the trade winds as influenced by the rotation of the earth. In 1800 Dalton published his epoch making paper on rarefaction and condensation, which became the basis of modern physical meteorology.

H. W. Brandes, a German from the Palatinate, was the first to publish a series of daily weather charts. They appeared in 1820 but covered the year 1783. His work was dependent on the data of the Chevalier de Lamarck working with Laplace, Lavoisier and others who had been collecting and publishing meteorological information for about twenty years. Brandes also published maps of certain great storms of 1821 and 1823 and explained them in a proper meteorological way as being produced by barometric depressions, now called cyclones, advancing from west to east over the earth's surface. He had been preceded in this theory by the observant Benjamin Franklin, who by asking for information about a certain storm from members of the Continental Congress who came to Philadelphia from various points in the eastern part of the United States made the discovery that storms move. Brandes proposed the organization of regular meteorological services for the study of storms, and between 1850 and 1856

several European countries established meteorological stations.

The telegraph made it possible to assemble data promptly and was a necessary device for the modern weather service with its daily forecast, which began to be published regularly in England in 1872. Only two continents, Europe and Australia, have complete daily weather maps, but such maps are also published by the United States, Argentina, India, Japan, the Soviet Union and by the Jesuit Observatory near Shanghai.

An obstacle to the study of weather and climate is the lack of sufficient preliminary data. We live at the bottom of a sea of air which is perhaps 200 miles high and covers about 200,000,000 square miles of land and sea. A small captive balloon released and allowed to ascend 20,000 feet will sometimes show four different wind directions within the zone of its ascent—a fact suggesting the need of observing the upper air as well as making the usual surface measurements of temperature, pressure, rainfall and cloud and wind direction.

Through the work of Alexander Buchan, for years secretary of the Scottish Meteorological Society; Julius von Hann, director of the Austrian Meteorological Service; the British Meteorological Office; the American Weather Bureau and many other weather bureaus and private scientists, many weather data have been collected, but many more are needed. For example, William Hobbs has recently advanced a plausible theory, supported by some observation, to the effect that the Greenland ice cap is the place of origin for many storms of the north Atlantic (*The Glacial Anticyclones*, New York 1926). Years of observation will be required to prove or disprove this theory. Meteorologists are sure that meteorological observation on the antarctic continent would be of great value, perhaps in aiding prediction of great droughts in the southern hemisphere especially and in some measure in the rest of the world. If the money necessary to run two battleships could be devoted to the study of the air, man's power to predict weather could probably be multiplied many fold.

The Influence of Climate on Man and Civilization. It is generally agreed that weather and climate have both direct and indirect influences upon man and upon civilization, but there is very little exact knowledge as to the extent of this influence. Everyone knows, however, that extreme heat, especially when accompanied by

humidity, makes men disinclined to physical or mental exertion; that cool, bracing weather stirs him to activity; that strong wind is unpleasant.

Weather and climate have an indirect influence upon man through the action of pests: gnats, mosquitoes and other annoying insects. Still more indirect are the influences of certain climates on the prevalence of diseases, such as yellow fever and malaria, which are transmitted by mosquitoes. The tsetse fly bears sleeping sickness; in certain damp climates the hookworm thrives. As medical knowledge advances man may control and even eradicate these diseases thus making the regions habitable, but at the present time it is the insect and not man who reigns over large areas.

Climate indirectly influences man also through its relation to the food supply. Irregularities of weather, producing great fluctuations in the supply of food, tend to result in migration. Climate has a great part in deciding whether man in a certain place shall be a farmer or a follower of flocks; whether certain land will have no inhabitants, one inhabitant to ten square miles or one or one hundred or one thousand to the square mile; whether man must live in a tent or may live in a city rich with cultural accumulations. Climate is sometimes a factor even in the degree of dependence among men. For example, in some areas the necessity of irrigation compels men to work in large groups in order to control the distribution of rainfall, while abundant and regular rainfall permits the small farmer to be entirely independent of his neighbor, as far as farm production is concerned.

Hippocrates, in the fifth century B.C., was probably the first writer in western literature to express the idea that weather molds the life of man. In his treatise on *Airs, Waters, Places* he tells how the knowledge of climate ought to be used and explains the differences between the East and West in habits of life and character as a result of the differences in climates. This idea of climatic dependence was also firmly held by Montesquieu, even to the point of belief in the influence of climate on philosophy and religion. He points out that people in cold climates are more vigorous than those in hot climates and that heat results in a profound disinclination to mental effort and hence produces differences in culture, philosophy and the observances of religion.

Buckle in his *History of Civilization in England* advances the thesis that civilization can

arise only where wealth, made possible by a favorable climate, gives leisure. He cites the semibarbarous nomadism of the Asiatics while they lived in arid pastures and the contrast of their culture when they had migrated to regions where water made fat lands and permitted them to build Cordova, Bagdad and Delhi.

The German geographer Karl Ritter is commonly regarded as the first modern exponent of the school of thought which holds that geographic elements, including climate, are often a force that molds the affairs of men. Ritter cites the work of Schouw, who divided Europe into four zones according to the indigenous trees rather than the latitude: pine and birch; beech and oak; chestnut; and evergreen tropical trees. Such zones, characterized by their indigenous trees and crop plants, Ritter held to be easily establishable over the entire earth. This is properly regional geography. The map of Herbertson expresses this type of analysis.

The views of Friedrich Ratzel are virtually the same as those presented at the beginning of this section.

From Hippocrates to Buckle and Ratzel the philosophers on the influence of climate have dealt mostly with unmeasured data derived from casual observation. In our own time Ellsworth Huntington has introduced the quantitative method. Geological studies in central Asia brought Huntington to large ruined cities in deserts where men could live at the present time only by irrigation, for which the nearby streams are entirely inadequate. These observations suggested to him that climate had changed within historic time. His theory of cyclical fluctuation was developed by further study and embodied in *The Pulse of Asia*. The thesis of this book is that wet eras raised large populations and that dry eras forced them to migrate into Europe, China and India. The variations in the rate of growth of the big trees in California furnish interesting corroborative climatic evidence of this theory.

In *Civilization and Climate* Huntington passes to the effect of climate upon man and advances evidence from records of factory workers and marks of college students to show that man is most energetic physically at a temperature of about sixty to seventy degrees and in a place where there are frequent changes of temperature of a few degrees in each direction. This requirement is furnished by the cyclonic weather of western Europe, western North America, eastern North America and eastern Asia, north of latitude 30° on the east

coasts and 35° on the west coasts—the present centers of greatest human activity. Huntington goes even farther and claims that man's mental activity is greatest at a temperature of about forty degrees and that both physical and mental activity decline with extremes of either heat or cold. He finds similar conditions in the physical activity of animals and plants.

Such deductions as these point toward an interesting theory concerning a climatic explanation of history. Ward, Sorokin and others have criticized the Huntington theory in various of its aspects, and certainly much research remains to be done. For the present, however, it has at least the advantage of coinciding with many conclusions already accepted by most students. For many of the questions he raises there can be no possible answer in the present state of our information. There are still basic data missing in our comprehension of changes in both climate and weather. Even the important question of atmospheric circulation and variation in air pressures remains still unsolved.

When one considers that the whole human race is continuously influenced by climate, so absolutely dependent upon it, one is shocked that it has been but little studied. Potential economists, historians, political scientists, sociologists and anthropologists are trained with no insistence on a knowledge of geography further than that required in the elementary schools. This omission of a fundamental science becomes all the more incomprehensible in view of the fact that the basic importance of climate and other elements of geography has been known for centuries. The study of climate should be a major research of the scientific and also of the economic world.

CLINICS AND DISPENSARIES. A clinic is a medical institution for the treatment and prevention of disease or for the promotion of health among ambulatory patients exclusively. This description more nearly corresponds to modern usage than the etymological definition, "a center for medical education." When the clinic is attached to a hospital as a division furnishing service to ambulatory patients it is known as an out-patient department. The portion of a clinic concerned with the actual dispensing of medicine is usually called a dispensary, although in some instances the term is still used to denote the type of organization defined above as a clinic.

The various types of clinics are classifiable, according to affiliation, as out-patient departments of hospitals or unattached clinics. According to function they may be curative, preventive or diagnostic. They may be teaching clinics, attached to hospitals or working independently, or health stations and health centers. According to the range of diseases treated they are ordinarily defined as general and special; according to their motivation, as non-profit and profit making or proprietary. The special clinic may relate to any one of the subdivisions or specialties into which medicine is divided from anaphylaxis to X-ray. The non-profit clinic may be a free or a pay clinic, and the latter may make only nominal charges or may charge fees high enough to cover all expenses. The auspices under which clinics are conducted, whether an industry, a church, a school or a child welfare organization, may also furnish distinctions between them and may have considerable bearing on their medical scope and purpose.

Health centers or organizations which provide, promote and coordinate medical service and related social service for a specified district sometimes establish clinics, but usually devote them solely to preventive services such as infant welfare, prenatal work, nutrition, dental prophylaxis, habit clinic service for preschool children, child guidance and other recognized public health activities. Mobile clinics of various

types for rural health work are often conducted by public health organizations. Health centers may also conduct clinics for the treatment of special conditions such as tuberculosis, cardiac, venereal and mental diseases or correction of the eye, ear, nose and throat defects of school children. Birth control clinics may or may not be affiliated with social agencies or hospitals.

Proprietary clinics run on a business basis are to be distinguished from clinics conducted as non-profit organizations or as branches of charitable societies. Proprietary clinics are usually group clinics organized by a number of physicians who voluntarily associate themselves to gain the professional and economic advantages of using in common a certain plant, equipment and organization. This type of clinic makes possible group diagnosis and group therapy and facilitates the exchange of ideas among the doctors so associated. In such units, however, medical social service is for the most part lacking. A group clinic may be distinguished from an association of independent practitioners utilizing personnel and offices in common by the fact that the former is financed by a joint income.

In 1926, the last year for which a list of clinics was compiled, the total number in the United States, classified according to type, was as shown in the table below.

NUMBER OF CLINICS IN THE UNITED STATES, 1926

Total Reported June, 1926	5726
Out-patient departments	1790
General	1302
Hospitals	1252
Medical schools	50
Special hospitals	488
Nervous and mental	197
Tuberculosis	107
Children's	52
Women's	49
Eye, ear, nose and throat	37
Orthopedic	26
Other	20
Unattached clinics	2793
Baby and child hygiene	1000
Tuberculosis	585
Venereal disease	350
Red Cross and health centers	350
General	347
Mental	79
Dental	57
Other	25
Clinics serving special groups	923
Industrial	500
Federal	423
Group clinics	220

Source: Davis, Michael M., *Clinics, Hospitals and Health Centers*, p. 38.

Clinics for the poor appear to have been established in some mediaeval European medical centers, and there are indications that similar institutions existed in ancient Greece. In Great Britain the earliest clinics, known as dispensaries, were established toward the close of the seventeenth century; those in the United States, modeled after the English clinics, appeared a century later. As medical education developed beyond the stage in which the student learned through individual preceptors, the clinic, originally charitable in purpose, was utilized also for medical teaching. In Boston, New York and Philadelphia medical education began to utilize the clinic before the middle of the nineteenth century. Later in the century the division of medical practise into specialties required opportunity for concentrated study of particular organs and diseases. Hospitals concentrating on the treatment of eye, ear, nose and throat defects and pediatrics usually had large out-patient departments which afforded students opportunity for observation and practise work.

The early twentieth century marked the beginning of organized public health work for the control or prevention of tuberculosis, infant mortality, maternal mortality, venereal disease, mental disorders, diseases of the heart and cancer. All of these health campaigns have in common two methods of procedure: the education of the public to the need of preventive measures and the increasing of facilities for the detection, care and control of disease. Each movement has required a large extension of clinic service. The development of health clinics and health centers may be said to have begun in the years immediately preceding the war, and they entered a period of more rapid growth shortly after the close of the war. In eighty-three large cities of the United States covered by the survey of the Committee on Municipal Health it was found in 1923 that eighty-one had clinics for the treatment of babies, seventy-seven for tuberculosis, sixty-eight for prenatal care, eighty-one for venereal disease and thirty-one for mental disorders, whereas in 1900 there had been only about one hundred and fifty clinics of all kinds in the entire United States. The new preventive or public health clinics were maintained largely by city health departments, with the exception of the venereal clinics, most of which were in out-patient departments of hospitals either supported entirely by private funds or with some state subsidy. In recent years many hospitals have taken over as out-patient departments un-

attached clinics either with help from the city health department or with merely general co-operation from health authorities.

In Great Britain the long established voluntary hospitals in the larger cities have well developed out-patient departments. The total amount of out-patient service in London is probably greater than in New York, but is almost exclusively for the very poor. Through the panel system of providing medical service the British national health insurance has rendered it unnecessary for employed persons to come to these clinics for general treatment, but the clinics are widely resorted to for specialized treatment since specialists are not furnished under the British Health Insurance Act.

On the continent out-patient service was developed at first chiefly in the teaching institutions; more recently the health insurance systems in Germany, Austria, Poland, Russia and other countries of eastern Europe have initiated extensive clinics. Certain of these health insurance clinics provide general medical attention; others are centers for referred diagnostic cases and for specialized treatment. They are not charitable institutions but, like the German and Austrian health insurance systems, are supported by payments from the beneficiaries and their employers and are managed by a committee which is chosen jointly by these two groups.

Standards of clinic service are usually adapted to the field of work undertaken. A clinic may be organized solely to receive a dozen or twenty mothers and babies in a day and may be in session only a few times a week, or its administration may be confronted with the problem of assembling and managing an organization of as many as twenty specialized departments receiving two thousand patients in a day. Consequently if standards or principles for the organization and administration of clinics are to be broadly applicable they must be framed in very general terms.

The standards of a clinic are determined by the quality of the medical service, the adequacy of quarters and scientific equipment for the amount and scope of medical work to be covered, the quality and quantity of such professional and administrative personnel as is necessary to assist the physicians and the extent to which cooperative relations are established with the organized social forces of the community. These forces include the practising medical profession, official and voluntary health agen-

cies, social agencies and business establishments as well as possible sources of financial support such as philanthropic individuals or organizations.

Technical standards, formulated by the Associated Out-Patient Clinics of New York and later adopted by the American Hospital Association, included the intimate association of the out-patient and in-patient services of the hospital and the unification of their medical staff and administrative organization; the limitation and regulation of the number of patients in accordance with the facilities of staff, space and equipment; the establishment of adequate laboratory service for the out-patient department; the provision of nursing service, hospital social service and clerical service; and the maintenance of adequate records of medical work, attendance, income and expenditure.

A system of case accounting is valuable in giving statistics for testing the clinic's efficiency and the relative proportion of its work which is carried out to a conclusion. Through it the clinic management and the physician may learn the degree to which patients are attending the clinic and are thus able to make periodic summaries of the extent to which patients remain under treatment, lapse or drop out altogether. Local studies have shown that as a rule more than half the patients make only one visit to the clinic and that only two fifths of all cases are considered satisfactorily closed.

In the United States several organizations are now engaged in surveys of the work of clinics. The Committee on the Cost of Medical Care includes in its five-year program of study special consideration of clinic service. The Committee on Out-Patient Work of the American Hospital Association and the Associated Out-Patient Clinics Committee of the New York Tuberculosis and Health Association are interested in higher standards of efficiency.

The divisions of a clinic which are principally responsible for its efficiency are the service departments, which deal directly with the diagnosis and treatment of patients. The primary professional staff of these departments consists of the physicians or dentists, divided for working purposes into such departments or specialties as the size and scope of the clinic may require. They are usually appointed by and are under the supervision of the final authority of the clinic, generally the board of trustees. In the out-patient department of the hospital the in-patient and out-patient staffs are expected to

work as one organization and the executive in immediate charge usually has the rank of assistant superintendent of the hospital or its equivalent. In the better organized clinics the staff communicates with the trustees through a liaison officer or committee. In unattached clinics the executive officer is appointed by and is responsible to the final governing authority. Research workers and technicians also may be considered as part of the clinic staff although in a hospital with an out-patient department the laboratory and X-ray departments usually serve both ambulatory and bed patients.

The secondary professional groups are the nursing staff and the social service workers. In an out-patient department the former is part of the general hospital nursing service, and out-patient work provides valuable educational material for the student nurses. Hospital and clinic social service is a comparatively new development. It has become an important aid to the physician in supplying him with the necessary information concerning the patient's background, assisting him to instruct the patient and in removing obstacles to successful treatment which the patient's social and economic circumstances may involve. The follow up work of the social service department in seeing that the patient puts into effect the clinic's recommendations is particularly necessary in view of the high number of single visit cases and of cases recorded as incomplete. The social worker in the clinic is also essential in establishing cooperative relationships with the charitable and educational agencies of the community, and aids in determining the somewhat obscure boundary line between medical and social responsibility in a case.

Clinics are governed by the general laws affecting medical practise and philanthropic organizations and have been subjected to few special legal regulations. A few states require clinics to be licensed by a state authority, mainly for the purpose of protecting the public against commercial and quack undertakings masquerading as public spirited services. In a few large cities this authority is vested in the local health department. The legal responsibility of the clinic physician is generally the same as that of the physicians in hospitals and charitable institutions. In group, industrial and other clinics conducted on a proprietary basis, however, the position of the physician is legally that of a private practitioner. Medical societies have in some localities taken steps to define the

conditions under which member physicians may engage in clinic work.

The financing of clinics and their effect on the income of private practitioners has been the subject of much debate. Clinics, like hospitals, were originally established solely as charities; consequently the income derived from their operations was insignificant. The financing of clinics was until recently almost wholly a question of securing gifts to meet the meager expenses. With the development of higher standards and more expensive personnel and equipment, costs have greatly increased; and with the broadened scope financial policy has changed. Throughout the United States fees are now generally collected from patients attending curative clinics, although clinics maintained by tax funds generally, but not always, furnish free service. In clinics giving treatment there has been a steadily growing tendency to make additional charges for X-ray, laboratory work, special treatment and appliances. As a result the out-patient departments of hospitals now earn an increasingly large proportion of their expenses. Clinics doing only preventive work rarely exact fees.

The operating expense of a clinic is generally expressed in terms of the cost per visit. This cost varies within the departments of a clinic and is largely determined by the clinic's standards of service. The average cost per visit in out-patient clinics of higher standing now approaches one dollar and is approximately double that in clinics which pay their physicians.

In the traditional charity clinic the physician gave his services without financial remuneration and this is the case in many of the present day clinics. In return the physician derives some professional experience and prestige from his association with the clinic. This in important teaching clinics may be a very real form of compensation and has significance even in smaller clinics.

The large amount of time given without pay to clinic service is frequently offered as a defense for the high fees charged private patients. In recent years, and especially in cities, hospital and clinic work has made an increased and more systematic demand upon the time of the best known physicians and selected younger men, and it is possible that this is a valid argument. On the other hand, it may often be the case that the experience, the reputation among the laity and the professional prestige which enable physicians to charge the high fees men-

tions are derived from these otherwise unremunerated hospital and clinical connections. Whatever the causal relationship, and there seem to be grounds for both types of argument, there can be little doubt that the growth of clinic service and the increase of rates charged to private patients have gone hand in hand. There is, however, a growing tendency to pay physicians for clinic service. This is particularly true of clinics established for public health service in which the experience has less professional value. It is extending also to clinics treating the sick, particularly the "pay" clinic, in which the term "pay" refers to the practice of charging a fee to the patient. It is thought, incidentally, that a patient will more probably carry out instructions when a fee is charged than when the treatment is free.

As clinics extend their medical scope and serve a larger proportion of the population, including those who can afford to pay moderate fees, it is essential that remuneration of physicians for clinic service should become more general and be in proportion to the services which they render and the benefits which they derive. Also, paying patients complain of clinic diagnosis by inexperienced and sometimes incompetent "externs," the waste of working time through long waits and ill arranged schedules and the mass methods of treatment. This dissatisfaction with the service at a non-profit pay clinic may lead the public to turn to private group clinics for specialist services or may result in a willingness to pay clinic fees high enough to allow reasonably high payments to physicians within the clinic.

The determination of patients' eligibility for clinic service has received much study. Many clinics have examined social-economic standards for the guidance of their admission departments. According to the American Hospital Association in a report of one of its committees, "three factors need to be considered with due consideration of local community conditions; namely, the income of the patient or family, the size and responsibilities of the family according to a reasonable standard of living, and the character and probable cost of adequate medical treatment for the disease or condition found." The best organized clinics do not reject a patient on economic grounds before these factors have been determined. In considering the living standard allowances should be made for the element of variation based on individual family standards. The widely varying

cost of care for different illnesses is also a factor affecting the ability of patients to pay.

The subject of eligibility to clinic service has become more complex with the increasing tendency to adjust medical rates in private practice and in institutions to the patient's ability to pay and with the development of pay clinics. Some doctors complain that the clinic takes away their more profitable ambulatory practice but leaves to them the time consuming and less lucrative bedside practice. Protracted discussions and not infrequently controversies have arisen over the so-called "clinic abuse," by which has ordinarily been meant the application and acceptance at free clinics of patients who could afford to pay for the services of a private physician. Yet it has been pointed out that public protection requires adequate treatment of the diseased condition of a patient as a more primary need than ascertaining his ability to pay. In a committee report of the American Hospital Association in 1928 it was shown that only a very small number of patients accepted by many clinics which were studied could have paid for private services, the proportion being usually about 2 percent.

The improvement of service in clinics and greater public attention to the care of disease and the correction of physical defects as well as the increased costs of private treatment have caused an increasing number of self-supporting persons to seek clinic care, particularly at outpatient departments of teaching and other well known hospitals. Statistical evidence indicates that the great proportion of middle class patients come for treatment in the specialties or for conditions which are relatively expensive to diagnose and treat because of their duration or the large amount of laboratory and X-ray work required.

The relation of clinics to the organized medical profession is a problem as yet imperfectly worked out. Some clinics in this country and some of the health insurance clinics in Europe have been opposed by medical societies. These difficulties are in part due to misunderstandings which could have been removed by conference between those sponsoring the clinic and local representatives of the organized medical profession. Up to the present time in the United States clinic work has advanced chiefly in the specialties and the more expensive forms of diagnostic and curative service; a relatively small proportion of patients have come to clinics with conditions that would be treated by general

medical practitioners. It is to the interest of public health that adequate medical service be available to all and that clinics be utilized to this end in so far as is necessary.

The mere existence of competition between clinic practise and private practise is not in itself inequitable. If clinics can provide general or special medical service of good standard at substantially lower cost to the public and include in this cost reasonable remuneration for the medical personnel, then clinics undoubtedly have a sound economic reason for development as a form of medical practise and not merely as medical charities.

CLINTON, DE WITT (1769-1828), American political leader. Clinton entered political life as a Republican a short time after he had graduated from Columbia College in 1786 and, with the aid of family connections, rose rapidly to prominence. He served in the New York state legislature, in the United States Senate, from which he resigned to become mayor of New York City, as lieutenant governor and as governor of New York for several terms. His career was illuminated by an amazingly progressive social viewpoint and a remarkable capacity for leadership. He found time also to indulge numerous scientific and intellectual interests worthy of an eighteenth century savant.

In matters of politics—although he has been accused of being responsible for the introduction of the spoils system in New York—Clinton

usually followed his convictions, irrespective of the loss of personal advantage. He was a vigorous opponent of the Tammany-Virginia wing of Republicanism and many of his views resembled those of his Federalist opponents.

Clinton was an ardent proponent of measures to ameliorate the condition of the poor and to safeguard public health. He advocated the abolition of slavery in New York, of imprisonment for debt, of the severe punishment for minor infractions of the law and of the political disabilities of Roman Catholics. Clinton was the first president of the successful New York Free School Society, which adopted the then highly regarded Lancasterian system of teaching. Holding liberal views on the questions of the education of women, Negroes, Indians and juvenile delinquents he urged the necessity of universal publicly supported education as a basis for democratic government and human progress. He gave a great impulse to free school development, the professional training of teachers, the broadening of curricula and the spread of vocational education.

From the beginning of his political career Clinton took an active interest in the development of internal improvements. His long fight for the construction of the Erie Canal, carried on in spite of the strenuous opposition and humiliating personal attacks of politicians in New York City and elsewhere, was the greatest achievement of his life. Clinton foresaw the value of the canal for the economic development of New York and the success immediately following its completion in 1825 demonstrated the truth of his views and encouraged other states to undertake internal improvements which marked the beginning of a new era in the economic expansion of the United States.

CLIVE, ROBERT, LORD CLIVE (1725-74), British soldier and colonial administrator. The founder of the British Empire in India was born in Shropshire, where his family had held an es-

tate since the twelfth century. At eighteen he was nominated to a writership (clerkship) in the service of the East India Company and arrived at Madras in 1744. After a few years he secured a commission and began active service in southern India, where the French and English were engaged in rival intrigues among the native rulers. He showed conspicuous daring and resource, and his bold and successful seizure of Arcot in 1751 had a resounding effect throughout India. In 1753 Clive was given a great welcome in England. On his return to India two years later he was at once called to Bengal. In 1757 he defeated at Plassey the nawab, Siraj-ud Dowla, who had captured the new British city of Calcutta and perpetrated the atrocity of the Black Hole, and thereby he made himself the virtual ruler of Bengal. It was in the plot against the nawab that Clive sponsored the forging of a treaty which betrayed his Bengali agent, Omichand. Clive's four-year governorship, during which he displayed a capacity for civil rule almost as great as his military genius, laid the foundation of British power in India. He was sent out to Bengal again in 1764 to end the rapacity and corruption into which the administration had fallen. In 1765 he obtained from the decadent emperor of Delhi a firman conferring upon the East India Company the revenues of Bengal, which gave the alien trading corporation complete authority over a great region. Clive's second governorship lasted only twenty-two months. The evidence is clear that although he became enormously wealthy in India he refrained, especially in his later years, from the more shocking practises of too many of his Anglo-Indian contemporaries. His Irish title did not debar him from the House of Commons and he sat there until the year of his death, fighting directly against an organized parliamentary attack upon his record. This did not end until 1773 with the report of the select committee that he had rendered "great and meritorious services" to his country. Clive engaged also in a long struggle with certain agents of the British East India Company whom he charged with being guilty of political incompetence. He early favored the extension of British sovereignty to the company possessions as well as the unification of the Indian administrative service. He died by his own hand, leaving behind him in British India a political system molded by his bold and energetic mind and method.

CLOOTS, JEAN BAPTISTE (Anacharsis Cloots) (1755-94), Prussian baron, publicist and agitator at Paris during the French Revolution. He was rich, well connected and seems to have suffered from none of the cruder maladjustments sometimes supposed to explain revolutionaries. Early an admirer of Voltaire, he left his Westphalian home as a young man and went to Paris to join the *philosophes*, among whom he attracted no great notice. He has a dramatic moment in history: on June 19, 1790, he appeared before the National Assembly as "ambassador of the human race" at the head of a delegation of real or make believe members of various races, white, yellow, red and black, to thank twenty-five million Frenchmen for awakening the whole world from slavery. As an influential speaker at the Jacobin Club and as a member of the Convention he played a real part in the political history of the revolution, especially in preaching the crusade to free other peoples, in overthrowing the Girondins and in furthering violent dechristianization. His activities aroused the fierce enmity of Robespierre and he was guillotined in 1794. Cloots' writings by virtue of their complete unoriginality are excellent examples of how the political thought of greater men penetrated to the crowd, of how revolutionary ideas became revolutionary stereotypes. For the subtle and venomous anticlericalism of Voltaire he substituted the bludgeoning intolerance of the Jacobin. The general will of Rousseau he saw realized in loyalty to the Mountain. Saint-Pierre's theoretical schemes for world peace he transformed into the paradoxical armed conquest of peace by enlightened France.

CLOSED SHOP AND OPEN SHOP. A closed shop, as popularly understood in the United States, is a place of employment where none but union members may work. An open shop, according to its formal definition, is a place where workers are employed regardless of union affiliation and where unionists and non-unionists may

work without discrimination. This formal definition is intended to imply a certain ethical superiority for the open shop over the closed shop, and employers who are opposed to labor unions attempt to press this advantage still further by spreading the use of the term "American Plan" as a synonym for open shop. It is to be noted that a place that is closed to union members, where none but non-unionists may work, is commonly called an open shop.

These names, however, are but battle cries in the conflict between employers and labor organizations over the problem of unionization. They serve to obscure the essential point of contention, which is whether the shops shall be union or non-union. Many unionists therefore have insisted, vainly, on the substitution of the designations "union shop" and "non-union shop." If terms of employment are fixed by mutual agreement between an organization of workers and their employers the places covered by such agreements are union shops. If workers are employed individually on terms which the employers stipulate then non-union shops are maintained. The difference between the two types of shops thus hinges on whether wages and other conditions of employment are fixed by collective bargaining or individual bargaining. This is the crux of the controversy between labor organizations and employers, which the ethical implications in the words open, closed and American tend to obscure.

Both union shops and non-union shops may be open, closed or preferential. A closed shop may exclude union labor or it may exclude non-union workers. A preferential union shop gives preference to union members, while a preferential non-union shop discriminates against union members in favor of those who are not members. An open shop may be operated under a collective contract with trade unions as well as by employers who refuse to deal with unions. In industries dominated by great corporations and in those where the majority of workers are unskilled or semi-skilled laborers or women, shops are operated most commonly on a non-union basis. In the smaller, more competitive industries and in those where skilled labor predominates, union shops are, except in the smaller cities, most common. The building trades and the printing trades in the larger cities, as well as newspaper printing offices throughout the country, are outstanding in maintaining closed union shops. In the metal trades employers' organizations have been most successful in keep-

ing their shops closed and anti-union by means of central labor bureaus to which the names of active unionists are reported—in effect, a labor blacklist. Employers rarely admit that they close their shops to union members and usually espouse the open shop. But they mean thereby not union open shops such as prevail on the railroads but non-union open shops where members of labor organizations are permitted to work so long as they do not try to have the union represent them in negotiating terms of employment.

Trade unionists frankly defend the principle of the closed shop although in practise, because of the active opposition of employers and through considerations of expediency, they consent to open and preferential shops. Thus the United Mine Workers insist on closed shops in the bituminous fields, while in the anthracite districts the open shop was accepted until the agreement of 1930. Similarly the Molders' Union, which has a continuous history of almost forty years of collective agreements with Foundrymen's Associations, has found it expedient not to insist on the closed shop as a national policy, leaving local conditions to determine whether shops shall be open, closed or preferential. The railroad brotherhoods have never espoused the closed shop policy; and the Amalgamated Clothing Workers have open shop agreements in Rochester, preferential agreements in the Chicago market and closed shop agreements in New York City.

Methods of enforcing the union closed shop vary. In the bituminous coal fields the prevailing method is the check off, or deduction by the employer of union dues payable to the union. The use of this device by the union grew out of the traditional practise in the industry of employers deducting from workers' pay envelopes for equipment, company stores and rent, and was reinforced by inherent difficulties in the collection of dues and the maintenance of union standards. This method was adopted in the anthracite coal agreement of 1930. The "card" system, requiring due authorization from union officials for the hiring or continued employment of workers, the "button" system, by which union workers may identify those who are members in good standing, are other devices which shift back to the union some of the burden of keeping the shop closed. In other cases, where the discipline of the business agent or shop chairman is deemed sufficient to maintain the closed shop, no special device is required.

The issue of the closed shop is confined at-

most exclusively to the United States. In European industrial relations the union shop has been accepted more or less tacitly by employers and its tradition in workers' circles dates back to the period of the guilds. The closed union shop has not been so much stressed by European trade unions for many reasons. The higher degree of unionization, the fact that the working classes are more homogeneous in character and that opportunities for wage earners to move up in the economic scale are rare make it possible for them to depend far more on the class feeling of the workers to protect gains won by strikes and organization. In the United States, however, the presence of great numbers of immigrants, the relatively ample opportunities for workers to rise out of the ranks of labor, as well as other economic and social factors, made the development of such a feeling of class solidarity impossible. Threatened on the one hand by those who were willing to accept low wages and a long working day because they considered their position as wage earners only temporary, and on the other hand by new groups with lower standards of living, most American trade unions saw in the closed shop their only protection. Their policy, therefore, is not to be explained as a mere desire to force non-unionists to pay their share of costs and sacrifices involved in maintaining organizations and securing improved conditions.

The railroad brotherhoods had nothing to fear from immigrant competition; train crews could not be made up of foreigners. The nature of railroad administration, requiring as it does standardized schedules of wages, hours and rules of discipline which can be changed only by orders from a central office, also eliminated the possibility of lowering union standards by secret individual bargaining. Moreover, the hazardous nature of their occupation brought the men into the union rapidly in order to take advantage of insurance benefits. Amply protected by these conditions, the railroad organizations have been content with open union shops. The degree of insistence by unions on the closed union shop policy thus varies with their ability to make gains secure by other means.

There is a growing opinion on the part of the more far sighted American labor leaders that there must be a shift in discussion and policy from the issue of the closed shop to that of the union shop. Overemphasis on an inflexible closed shop policy has in some instances led to abuses in union management, has stiffened the

opposition of employers to all union shops and has alienated influential sections of the public. In such a shift the problem of whether union standards shall be maintained through closed, preferential or open shops will depend upon the special circumstances of each situation.

CLOSURE is the term applied in the British House of Commons to various devices for restricting debate. Like so many other English constitutional terms, such as cabinet and parliament, the word is of French extraction. On the continent the word *clôture* described the procedure of bringing debate to a close when members of a legislative assembly were still anxious to speak or unwilling that a vote be taken on the principal question. The word was anglicized when similar procedures were used in Great Britain and has been adopted in American procedure.

Although the progeny of the "Mother of Parliaments" found it necessary to restrict debate long before the British rules were formulated, the forms of closure which developed in the House of Commons are of special interest and importance. The lateness of the date (1881) at which the House of Commons acted on this question was due to several causes. The principal British parties differed on methods rather than on fundamentals. The members of the Commons were drawn in large part from the "governing classes," who looked upon parliamentary contests as a pleasant game to be played without undue intransigence. Before the advent of the Irish members there were in the House of Commons few irreconcilables. The Commons escaped the phenomena of religious.

racial or class parties whose obstructionist tactics on the continent had made various forms of closure inevitable. In the House of Commons, however, from 1875 on, Parnell and his Irish nationalist followers took every possible advantage of the rules of procedure. Long speeches, dilatory motions, points of order, questions of quorum and similar devices were developed to delay pending business. The motion giving precedence to the Protection of Person and Property (Ireland) Bill was fought for twenty-two hours in January, 1881. The introduction of the measure was opposed for four sittings, the last of which consumed forty-one hours. It was at the close of this sitting (February 2, 1881) that Speaker Brand intervened with his so-called "coup d'état" which introduced closure into the Commons. Brand refused to recognize any member for further debate and put the question. A crisis had arisen, he declared, "which demands the prompt interposition of the chair and of the House. The usual rules have proved powerless to insure orderly and effective debate. . . . The dignity, the credit and the authority of this House are seriously threatened and it is necessary that they should be vindicated. . . . Future measures for insuring orderly debate I must leave to the judgment of the House." The following day Gladstone moved an urgency rule which provided that if on motion of a minister the House resolved by a majority of three to one that the state of public business was urgent the whole power of the House to make rules should reside with the speaker until he should declare that the state of public business was no longer urgent or until the House so determined upon motion. The rule was adopted, but during the remainder of the session nearly two thousand points of order had to be decided by the speaker or chairman of committees. Disputes between the chair and members occupied one hundred and fifty hours of the time of the House.

At the next session more far reaching changes in the rules of procedure were made. They provided that when the speaker or the chairman of committees deemed it to be the evident sense of the House or of the committee that the question be put the presiding officer should so inform the House which would proceed to vote on a motion "that the question be now put." If supported by more than two hundred members or, if less than forty voted in the negative, by more than one hundred, debate would be closed. A discussion lasting through nineteen sittings was necessary before the change was effected.

The rule, however, was not put into operation until February 20, 1885, and only once thereafter. In 1887, when the Conservatives were preparing to introduce the Irish Crimes Act, the rule was drastically amended. The right to propose closure was taken from the speaker and given to the individual members of the House, although the speaker could refuse to put the motion if he thought that there should be further discussion. This closure rule was made a standing order on March 18. The next year the majority necessary for the rule was reduced from two hundred to one hundred, the speaker retaining the power of refusing to put the motion, if he thought it an infringement of the rights of the minority.

It soon became clear, however, that even more far reaching and at the same time more flexible devices to bring debate to a close were needed. Obstructionists could move amendments to every clause of a government bill. "Closure by compartments" (i.e. by sections and clauses) was therefore provided for, and this became known in common parlance as the "guillotine." A time table of days and hours for the discussion of sections of the bill in committee and on report is set up. At the times fixed the sections must be voted on without debate. Only the clauses of the bill and government amendments can be considered. The debate and votes on other amendments are automatically ended at the prescribed time. Governments, if they have a comfortable majority of the House of Commons, can always secure closure by compartments. In the early days, however, they were reluctant to do so until after considerable privileges had been given the minority. Thus the Irish Crimes Act of 1887 was debated for sixteen days and only clause six was reached. The remaining fourteen clauses of the measure were therefore put without discussion. The Home Rule Bill of 1893 was discussed for twenty-eight days and the Education Bill of 1902 for thirty-eight days before the guillotine was used.

Under the Liberal government of 1909 a new type of closure practise was introduced to meet the difficulty that, under the existing arrangement, important sections of a bill might go completely undiscussed and when inadequacies were discovered the government had to seek necessary amendments in the House of Lords. It was therefore decided to give the speaker or the chairman of Ways and Means authority to select amendments for discussion and to pass

by those which he deemed of scant importance. Thus discussion could jump from one section of a bill to another as the presiding officer determined. Such a form of closure speedily became known as "kangaroo." In its original form it could be used only when specially moved, but in 1919 the standing orders of the House incorporated kangaroo as part of the ordinary procedure. Every one agrees that it is a considerable improvement over closure by compartments, which was resorted to only once during the war—the Military Service Bill of 1918—and only twice in the 1918–22 Parliament. Guillotine was used, however, on the Trade Disputes and Trade Unions Bill of 1927, the Unemployment Insurance Bill of 1927, the Rating and Valuation (Apportionment) Bill of 1928 and the Derating and Local Government Bill, 1928.

Closure in debates on supply is covered by a special order. Since 1896 discussion has been limited to twenty days, with the possible addition of three days upon motion of a minister. Closure rules in Committee of the Whole are the same as those of the House, the chairman of Ways and Means or the deputy chairman exercising the power of amendment selection. In Standing Committee the majority required for closure is twenty instead of one hundred and kangaroo cannot be used.

Continental closure devices vary in severity and manner of application. In some cases closure cannot be moved while there are still *orateurs inscrits* who remain to be heard; in others an extra five minutes is allowed on a speech, or a speech by a minister cannot be prevented, or a two thirds vote is necessary. The result is, however, that dilatory tactics and obstructionist manoeuvres—*Dauerreden* was the term used in Germany—cannot be long continued. In all probability anything resembling the prolonged German and Czech obstructionist activities in the Austrian parliament at the turn of the century will not be repeated.

"Filibuster," the word used to describe minority obstruction in the United States, is now carefully guarded against by the rules of the House of Representatives. In the early congresses minority members did not wish to offend the "sense of the House." Not until the Eleventh Congress was there any use of the previous question (discussed in Jefferson's *Manual*, Sec. 34) and from 1811 to 1828 it was called for only four times. In 1821 a rule was adopted providing that, except with unanimous consent,

no representative could speak for longer than one hour. The most spectacular case of obstruction in the annals of the House had to be dealt with by a speaker's ruling rather than a closure motion. Parties were nearly equal in the House; the minority members refused to answer roll calls and the majority was thus unable to get a quorum. Speaker Reed finally put an end to this by the simple expedient of counting as present members whom he saw in the hall. A corporeal quorum, he ruled, constituted a parliamentary quorum.

It soon came about, however, that the most effective forms of closure in the House of Representatives were *ad hoc*. In other words, they were reported by the Committee on Rules for the consideration of particular bills. Most of the important and controversial business of the House of Representatives is now conducted, not under general rules but under special orders reported by the committee. The rules committee, indeed, has become the American counterpart of the British cabinet, controlling the time and dictating the decisions of the legislative body. There are, however, two important differences. The rules committee, though chosen and supported by the majority, is not a responsible leader securing its ends through a threat of resignation if its proposals are repudiated. In the second place, the committee frequently works by persuading the majority to accept, in advance, a self-denying ordinance depriving the House of the right to vote on anything except the enactment of a measure in the form proposed by the legislative committee. Guillotine and kangaroo in the House of Commons are by no means so extreme as this procedure in their operation.

How closure works in the House of Representatives is well illustrated by the procedure on the Tax Revision Law of 1921, which was substantially the procedure on the post-war tariff legislation. The 1921 rule provided that upon its adoption the House should go into Committee of the Whole House on the State of the Union for the consideration of the Tax Revision Law; that there should be two days of general debate equally divided between the chairman and the ranking minority member of the Committee on Ways and Means, terminating on August 18; that, thereafter, the bill should be considered for amendment under the five minute rule "but Committee amendments to any part of the bill shall be in order any time and shall take precedence of other amend-

ments"; and that on August 20 at 3 P.M. the bill and amendments should be reported to the House "whereupon the previous question shall be considered as ordered on the bill and all amendments to final passage without intervening motion except one motion to recommit: that the vote on all amendments shall be taken in gross." This meant that, despite much discussion, when the hour fixed for a vote arrived the House had but a single opportunity to express an opinion on what should or should not go into the bill. The minority leader could single out only one disputed issue and get a record vote upon it. In short, such a form of closure—not to speak of passage of measures under suspension of rules after forty minutes of debate and with no opportunities for amendments—makes guillotine and kangaroo seem extremely mild.

Practically alone among modern legislative bodies the House of Lords and the American Senate are extremely reluctant to limit debate. The House of Lords, scantily attended and shorn of any real legislative power, is not a forum in which conflicting aspirations struggle for supremacy. The political battle is always much more of a sham than in the House of Commons. Not until 1926 was closure ever resorted to by the House of Lords. Then it was applied to check Labour opposition to the bitterly contested eight-hour bill. Subsequent criticism and discussion seem to indicate that a much more extraordinary emergency will be necessary to justify a second use.

Until 1917 the American Senate had no rules for limiting debate. The rule (XXII) now provides that, upon a motion signed by sixteen senators, the presiding officer shall, without debate, on the following calendar day but one submit to the Senate the question, "Is it the sense of the Senate that the debate shall be brought to a close?" If a two thirds majority is secured the pending measure remains unfinished business. No senator is thereafter entitled to speak more than one hour and no dilatory motion or amendments are in order. The rule was invoked for the first time in November, 1919, when, after several months of discussion, the debate on the Treaty of Versailles was brought to a close. The rule has been used several times since then and its use has been occasionally threatened, but it remains an emergency and not a normal method of procedure. The same result is usually reached in the Senate by a unanimous consent agreement that on

particular legislation a time table be adhered to.

In short all legislative assemblies have the problem of attempting to reconcile two irreconcilable conditions: certainty of business and liberty of discussion. A minority which successfully obstructs may in effect defeat. Hence the development of various forms of closure, whose justification can be determined only with reference to the general framework of government in which the particular assembly functions. The House of Lords needs no closure to bring debate to a close. In the American Senate occasional filibusters are preferable to even moderate gagging, for the peculiar position of this body makes closure undesirable. In most other assemblies, however, the problem is to insure adequate discussion and to permit adherence to a legislative time table.

CLUBS. As a form of voluntary association a club is clearly distinguished from all those major associations—the state, the church, the family—in which membership is practically obligatory and which have been considered basic for the continuance of society. It may be defined narrowly, so as to include only the clubs of Pall Mall and their imitators, or so broadly as to include almost all forms of voluntary association. If, however, we adopt a classification of voluntary associations into occupational, religious, cultural and recreational associations, clubs will be found to fall, at least in modern times, mainly in the last two categories. Perhaps their distinguishing mark, as contrasted with other voluntary associ-

ations, is that they are concerned with leisure activities. Whether the interests that they are formed to foster are social, literary, artistic or athletic, their demarcation from such associations as learned societies, joint stock companies, trade unions and political parties is fairly clear.

In primitive communities the dominance of ceremony and ritual in all phases of life makes clubs and secret societies common, and the age groups and systems of consanguinity often furnish a convenient nucleus for them. These clubs and societies are associated with religious and leisure activities and sometimes even perform political or military functions. But they differ sharply from modern clubs because of the entirely different nature of their social setting. Generated by impulses toward ceremony and secrecy and sanctioned by a mass of traditions, they lack the comparatively unregulated and ad hoc character of modern clubs.

Although we can find no duplicate of Brooks's in the history of Greece and Rome we find numerous groups which give play to the same desires and ambitions that animate the English clubman. The Doric *συσσίτια* were really eating clubs. The *ἐταίρειαι* of Athens were clubs of young men, originally meant to provide pleasant meals and good company, but later becoming involved in politics on the oligarchical side. These hetaerics eventually became full fledged political clubs, instrumental in swaying the deliberations of the assembly and the outcome of elections and active in manipulating the machinery of justice in lawsuits; but, as with most political clubs, their social activities continued. The religious associations, organized to maintain and administer the cults of foreign deities, also constituted a striking feature of Greek life, and with the growing cosmopolitanism of the Hellenistic period their number increased. But by the nature of their purposes they seem to fall rather with the shamanistic societies of the American Indians and the Melanesians than with our modern concept of a club.

The fact that the Roman *collegium* is generally translated "guild" should not obscure its real nature as a club. The groups of artisans which composed these clubs, although banded together primarily to protect the economic interests of the craft, also provided banquets, honorific titles and burial benefits and in general served social rather than economic ends. The *collegia* spread like a network over the whole of the empire; in the large and sprawling Roman world they satisfied the need, especially of the poor, for a com-

pact companionship during life and secure burial after death. The *sodalitas*, associated with the maintenance of cults, was probably a social gathering originally, with feasting at least as important as the religious rites which united it to a simpler past. By Cicero's time, however, the *sodalicia* were as completely and almost as effectively political clubs as Tammany Hall. The great Roman baths with their conversation halls, lecture rooms and even libraries were obviously clubs in all save exclusiveness.

Amidst the large number of autonomous associations that grew up in the complex social life of the Middle Ages there were many forms that were virtually clubs. The guilds, which up to the eleventh and twelfth centuries were primarily leisure associations, obtained an importance in the lives of the middle class (the freemen) greater even than in the time of the Roman Empire. Even when the guilds became primarily economic they still did much to foster drama, music and education; they offered a social life for both sexes and for old and young. The universities before they became endowed institutions were student societies. Religious fraternities were built up around the shrines of the saints to which pilgrims came seeking indulgences, and out of these developed later provident, burial and intercessional associations. Nor is it a remote analogy that sees in much of chivalry, with its orders of knighthood, its oaths and ceremony, its courts of love, the psychological equivalent of certain modern associations.

With the humanistic revival learning became one of the important interests around which clubs were formed and learned academies sprang up. In the seventeenth century in Germany *Sprachgesellschaften* did much to crystallize the vernacular. The rise of modern science in the same century brought in its wake numerous societies of natural philosophy which were chiefly discussion clubs. The modern club in the narrow sense of the word, however, had its typical development in England. Hoccleve's Court of Good Company serves as the starting point for most histories of English clubs. English history since Elizabethan times is full of the names of famous clubs—the Apollo, the Rota, the Kit-Cat, White's, Brooks's, the Carlton. Eighteenth century France had more of these associations than theorists would believe compatible with absolute monarchy—local academies, drinking and feasting clubs, agricultural societies, *chambres littéraires*; in the last named conversation, cards and politics made a combi-

nation almost orthodoxly Anglo-Saxon. The revolutionary clubs, whatever their origin, fused interests so immediately concerned with political change that they became at times coterminous with the government and made world history.

Behind all these eighteenth century clubs we may discern forces which were fashioning a society where classes were taking on new alignments, thought was mobile and innovation was becoming a matter of course. A new world was emerging as a result of the geographical discoveries and the mechanical inventions. A new class, the middle class, was coming to power, and its members were preparing themselves for their mastery of the new world by extending their interests in every direction or were consolidating the advance they had already made by banding together to give one another comfort and congeniality.

The most amazing proliferation of clubs was left to the nineteenth and twentieth centuries. One large category of them was organized for reform purposes of every variety. The regime of feudal aristocracy had left behind institutions which were anachronistic in a middle class society, and the industrial revolution was engendering new iniquities. To combat both, zealous groups of men and women organized themselves into clubs, threw all their energies into their common cause and often evolved the most efficient techniques of propaganda and administration. Abolition and revolution, corn laws and parliamentary representation, civil service, municipal politics and silver standard, temperance and women's suffrage, come readily to mind as foci of interest. Between these and the thousand and one organizations which have stirred public amusement by their insistence on their crotchety purposes the line is often hard to draw; what seems at first an eccentric whim becomes with the widening of humanitarian sentiment a condition of social order.

Another large category of clubs centered about the enlarged interests of groups such as women, working men and children, of whose importance and capacities society was growing more aware. Of these the most significant single development has been the growth of women's clubs, made possible by the economic revolution in the home and the new social status of women. These clubs have directed what might otherwise have been fugitive energies into channels of education and public affairs. Youth too has become more aware of the possible impact of its intensity on the temper of affairs; and while the numerous

fraternities and sororities are primarily for social distinction and in the tradition of secrecy, the organizations comprised under the somewhat flexible category of the youth movements indicate a new trend of the development in clubs. Germany particularly, where for a long time music and conviviality thrived under forms of club organization, has, especially since the revolution, turned this organizing propensity in the direction of cultural and physical development. Russia under the Soviet regime has extensively adopted the club form of organization for all sorts of groups with the purpose of mobilizing social energies for the new order. Perhaps the most extraordinary recent development of all has been the formation of sports clubs among all races and in all climates.

Clubs have apparently always helped to satisfy the desire, common at least among western peoples, to run things. They have provided offices and titles, committees, debates, resolutions, oaths, secrecy. Where their aims have not run counter to those of the government they have often played the part of safety valves and have given the common man an importance he would not otherwise have had. In large modern societies they have helped to satisfy human gregariousness. They may perhaps be regarded as taking the place of those extensions of the family, such as the clan and the brotherhood, which have disappeared from advanced societies. Finally, they give an obvious scope to minorities. Underdogs united are often well on the way toward ceasing to be underdogs.

Many social clubs are constantly tending to become something else: political clubs, economic organizations, even religious bodies. The *hetteries* and the *sodalities* became political bodies. Harrington's Rota was full of politics from the start. But White's, originally a coffeehouse run by an Italian named Bianco, became a gambling club and was turned into a Tory club by Pitt. The Jacobin clubs in most provincial centers grew from *chambres littéraires*, masonic lodges, mesmeric societies and such social groups and became during the Terror a religious sect. The Ku Klux Klan, in its origins merely a device to cow the Negroes, suffered a twentieth century revival as a body with unlimited political ambitions. Freemasonry, especially in the Catholic countries of Europe, has a definite political connotation.

The extent to which clubs reflect the larger society of which they are a part is difficult to determine. Their organization is usually mod-

eled on that of the state. The Roman burial clubs and guilds had as officers quaestors, praetors, aediles and so on and met and voted as assemblies. The American club has its president, vice president and secretaries, its constitution and by-laws. A little club at Toulouse in 1789 was presided over by the eldest member, called the *père patriote*, a curious reflection of the position of the *père de famille* in old France. Nevertheless, one cannot say, "like state, like club." The view that certain politically gifted peoples such as the Romans and Anglo-Saxons freely permitted rich association life while less gifted peoples did not is somewhat old fashioned. Fifth century Athens, eighteenth century France and almost any country today sufficiently controvert it. Nor can we definitely associate certain kinds of clubs with certain kinds of government. The stock despotism of the political theorist has of course no room for clubs. But most attempts at absolute government have evoked secret societies, like the Carbonari, in opposition. In democratic Athens the clubs had an oligarchic tinge. In Rome the clubs were used by the republicans to oppose the triumvirs. Although the great London clubs have set a characteristic tone, this has not prevented what must seem—save perhaps to a London clubman—their successful imitation in such different cities as New York, Paris and Berlin. It might appear that the federal form of organization, common to many American clubs, such as the service clubs, was a natural reflection of the federal state. Yet the famous Jacobin network was federal in origin, not by any means imposed from Paris, and nothing could be more genuinely federal, in the sense of a jealous reservation of local characteristics, than many present day federations of sports clubs in centralized France.

Of fashion at a given moment clubs are a surer reflection. For the history of the important part of human life summed up under the word fashion there are no better sources than the Athenian symposium, the Roman baths, the French salon, the English club, the American woman's club. Indeed, in one form or another the social club is perennial. Clubs have also helped to set the fashion in literature and the arts. The Mermaid Tavern group, "The" Club, the Cénacle, the Athenaeum and many others can hardly be omitted from literary history. The influence of clubs in literature, however, is not constant. "The" Club was a main factor in English letters of the later eighteenth century, but the romantics of the next generation eschewed clubs. And

if clubs often set the fashion they tend equally to become fashionable. Often membership in a woman's club is a result not so much of genuine interest as of social necessity. And for many in political life the political club, the chamber of commerce and the fraternal society represent each a nexus whose maintenance is a matter of prudent generalship in the struggle for votes.

The amazing variety of clubs in modern societies sets still other problems. Do clubs buttress class distinctions and attempt to fix standards? It is true that any club which brings its members together in their hours of ease to eat, drink, talk, play, will have them conform to common social habits; and it is true that groups, as such, resist change. Yet it may be doubted whether clubs in modern societies seriously add to class hostilities. In the first place, what Pareto calls the circulation of élites works particularly through clubs. Even Pall Mall has always maintained an alliance with the City and admitted those who have made commercial successes. The self-made man finds club life one of the best ways of entry into the ruling classes. Again, the diversity of clubs may serve to dissipate rather than to concentrate class feeling, especially such simple class feeling as that between rich and poor. Finally, many if not most modern political clubs were originally minority groups devoted to some great cause. Their composition cuts completely across class lines, for their cause is rarely a purely economic one. Jacobin clubs, abolition societies, the Anti-Saloon League, have numbered rich and poor alike among their members.

What is the true place of clubs in the modern state? Guild socialists may almost be said to plan a state composed of independent clubs, and the pluralists are generally favorable to these as to other groups within the state. In the past governments have generally attempted to encourage clubs favorable to themselves and to suppress clubs considered hostile or subversive, a policy not unknown even today. The simple solution, that of allowing complete freedom of association, is hardly acceptable, save to the philosophical anarchist. For the most harmless clubs have a way of acquiring a program of trying to get something done, a process which means today influencing or even controlling the government. Clubs are the natural instrument for a form of tyranny perhaps peculiar to modern democracies, the tyranny of altruistic minorities. Governments may be justified in suppressing or restricting such clubs. It must be admitted, how-

ever, that a mechanism for so selective a repression is yet to be found.

CLUBS, POLITICAL. The political club is perhaps best distinguished from other types of political associations by its possession of quarters available for social use by its members. It is less readily distinguishable from the general social club because the very idea of a club implies social activity and any club may on occasion acquire a political significance. Perhaps it is enough to classify as political those clubs in which social or recreational features are more or less subordinated to the political interests of the membership. Even this definition tends to exclude some of the more prominent national

political clubs in the United States, but this may be merely another way of saying that these clubs are of slight political significance.

The club is older than its clubhouse, the place of the latter having long been supplied by the tavern or the coffeehouse. The ancient guilds and the early masonic lodges were true clubs and many possessed local political importance. But the real prototype of the political club was Shaftesbury's Green Ribbon Club which flourished in the time of Charles II. This developed all the technique of leadership of the London mob and it played an active role in the Rye House and Popish plots and numerous political currents of the day. It may be credited with the earliest systematized "whispering" campaigns, and in the election of 1679 it functioned as a campaign headquarters. In many ways it anticipated the methods of the clubs of the French revolutionary era. Of the same era was the Rota (1659), or Coffee Club as Pepys calls it. The English coffeehouses generated clubs spontaneously. White's and Brooks's, which still survive, illustrate the evolution. The former was opened as a coffee or chocolate house just before 1700, the latter about 1764. As Tories became more numerous at White's and Whigs at Brooks's they developed into political clubs—genuine party centers. In the last half century the social features have overshadowed the political and these clubs, without losing a party tone, have been less important politically.

Political clubs were unimportant in France before the revolution, but with the turbulence that attended that upheaval a group of important clubs sprang into being. The most famous was the Jacobin Club, so called from the monastery which became its headquarters. This group had originally been the Breton Club, but with the revolution its members styled themselves "Les Amis de la Constitution," which they later amended to "Les Amis de la Liberté et l'Égalité." This was Robespierre's organization and had chapters widely scattered in the departments. The Cordeliers' Club, numbering among its members Danton, Marat and Desmoulins, had more influence in Paris, however, and was more outspokenly radical. The moderates too had their clubs, particularly the Club of 1789 (also known as the Fayetteists) and the Feuillants' Club, which had fewer members but wider influence. Even the royalists organized a club of their own—the Monarchical Club. With the passing of the revolutionary turmoil the clubs either went out of existence or con-

tinued with less political emphasis. These clubs were all essentially political parties.

The last quarter of the eighteenth century saw the growth of Whig clubs, and as the menace of the French Revolution became clear Pitt clubs were organized in all of the principal cities of England and Scotland. After the post-revolutionary reaction the renewed attack on the old order led the Tories with Wellington at their head to establish the Carlton Club in 1831. Five years later the Liberals countered with the Reform Club, which in a decade largely replaced Brooks's in the party councils. The Liberals also have among others the Manchester Reform Club (1871) and in London the Eighty Club (1880) and the more recent National Liberal Club. The Carlton remains the center of Conservative activity. There is a democratic atmosphere about the English political clubs which sets them off sharply from the English social clubs. The carefully preserved absence of haste which the English cherish gives these clubs a leisurely character that their American counterparts have never attained.

Persecution has always been an important stimulus to the formation of political clubs. There is a type which thrives only under oppression and languishes as soon as that is relaxed. The Dutch and Huguenot clubs of the early sixteenth century, the numerous clubs of all political complexions, but particularly the Puritans and Levellers, of seventeenth century England and all revolutionary clubs throughout their history from that day to this illustrate this tendency. In some cases clubs ostensibly non-political have had political aspects. Thus the Bohemian branches of the Sokol, a Slavic athletic and gymnastic organization, were rallying points for Czech nationalists before the war.

If politics were a matter of discussion the club would be an ideal instrument of political action. But modern politics is largely a matter of organization and discipline; it requires businesslike efficiency and active work among the voters. A clubhouse is a rather expensive type of headquarters and not well adapted to the making of contacts with the whole range of society. The modern French *cercles* and the German *Vereine* which belong to the discussion type, while highly significant in relation to political opinion, are organically negligible apart from the parties with which they affiliate. Before the war there existed throughout Germany among voters of the third class a type of ward club (*Kommunal Wahlbezirkverein*) which took

an active part in nominations for local office. These tended to follow national party cleavages, particularly in the larger cities, and devoted much time to the study of municipal problems.

Political clubs in America can probably be traced to the Sons of Liberty (about 1735) and the Tammany Society of New York City (1786). By 1800 branches of the latter society existed in Rhode Island, Pennsylvania and most of the southern states. The same period saw dozens of Jacobin clubs spring up in various parts of the country. With the victory of Jefferson the latter organizations subsided, but the Tammany societies survived into the second decade of the nineteenth century. The New York Tammany Society has had a continuous history in the politics of New York City and state from its inception down to the present day. Three of its leaders, Martin van Buren, Horatio Seymour and Alfred E. Smith, were candidates for the presidency. In 1868 the Democratic National Convention was held in its Fourteenth Street clubhouse. Of enduring importance are the Union League clubs, which still thrive in varying degrees in the larger cities of the North and West. The parent clubs were founded in Philadelphia in 1862 and in New York in 1863, the latter in order "to discountenance and rebuke, by moral and social influences, all disloyalty to the Federal Government." After the Civil War it added a resolve "to resist and expose corruption, and promote reform in our national, state and municipal affairs." The Democrats of New York City promptly countered by forming the Manhattan Club (1865). Several of the party's candidates for the presidency during the next half century, including President Cleveland, were members of this club, and many national leaders continue on its roster. It could hardly be said today that any of the Union League clubs, or the Manhattan Club, or even the National Republican or National Democratic clubs, play any important role in the affairs of their respective parties. It is noteworthy that there are no great party clubs in the city of Washington, so that the New York City Democratic Club in 1906 and the New York Republican Club in 1917 called themselves the national clubs of their parties.

The American ward club is a rather different thing from those thus far described. The politics with which it has concerned itself has not been the politics of issues of state but rather the distribution of patronage. American politics is more highly organized than politics in the

countries of Europe; particularly in large cities it is dominated by compact and well disciplined organizations. The unit of control is the ward. Within this the nuclei of political life are the clubs. The organization may be named after the founder who once dominated it and may still be doing so, as in the case of the Edward J. Ahearn Association or the Patrick H. McCarren Democratic Club, or it may bear a name of historical or geographical significance only. The dues are low enough to permit anyone to belong—usually about two dollars a year and rarely more than fifty cents a month. The membership ranges from three or four hundred to as many as a thousand. Much of this membership is nominal; business men and others in the neighborhood, since they may some day need a favor of the club, deem it a good policy to pay dues. The clubhouse is usually a three or four-story house originally intended as a family residence. In some sections of the city where real estate is too expensive the organization may have to content itself with two or three floors above a store. The appointments are frugal—a general room with chairs that can be folded and put aside to permit dancing, a pool room, a card room or two and spittoons everywhere. This simple equipment suffices even for the most powerful of such organizations. In addition to monthly "affairs" held at the clubhouse there are two "balls" each year held in some public hall—one between Election Day and Christmas and one between New Year's Day and the beginning of Lent. There is also a summer outing or clambake at some popular picnic center.

The membership is drawn from the neighborhood. The great majority of active members and habitués are civil servants or aspirants for public jobs. They "run" the club and in their hands it becomes a powerful instrument for the control of nominations to local offices. An aspirant to the mayoralty or governorship who did not have the support of these organizations would make little headway against one who did. In the well oiled urban political machine, such as the Tammany organization in New York City and the Vare organization in Philadelphia, there is a "regular" or centrally approved club in each ward. Elsewhere local politics within each party is a conflict between the various ward clubs ceasing only when a city leader or "boss" emerges. Even in the cities named there is always a miscellany of minor clubs, such as the 19th Assembly District Porto Rican Demo-

cratic Association or the John Scavani Association. When an aspirant for leadership in a dominant club finds his ambitions thwarted he usually swarms his followers and moves off to form a new hive.

One recent tendency may be worth noting. The bar was once the very center of life in these clubs. With prohibition this has been largely suppressed, though a few New York and Chicago clubs and a somewhat larger number in Philadelphia have a "speakeasy" department. Women's suffrage has also added to the respectability of the clubs. In some places, however, the inner group, while maintaining the clubhouse for formal and routine business, has moved out to a nearby speakeasy or gambling house for the transaction of its affairs.

These ward and district clubs have been entrenched in power virtually since the Civil War. The few occasions when the self-styled "better elements" have captured control of particular cities have always resulted from conflicts of rival clubs within the party organization. It was in recognition of this power that the Reform Club, organized in 1888 by a group of citizens in New York City particularly interested in tariff revision, turned its attention to civil service and electoral reforms. This and the City Club, founded in 1892, were attempts to meet the machine cohorts on their own ground. The sponsors of the City Club hoped to establish local units in every ward of the city. A few of these were actually opened but soon foundered, and the City Club persists today as a variant of the Voters' League type of civic organization. City clubs now exist in over a dozen American cities and almost as many flourishing women's city clubs have since been established. This type of organization has achieved a stable place in reform politics.

CLUNET, ÉDOUARD (1845-1922), French international jurist. In 1873 he founded the *Journal du droit international privé*, more commonly referred to as "Clunet," and still current as the *Journal du droit international*. He was among the first in Europe to realize the immense practical importance which judicial relations resulting from the growing development of international commerce were eventually to acquire. Moreover he felt it necessary to provide the practising lawyer with a working tool hitherto lacking, and accordingly undertook in his *Journal* to collect with care and to classify methodically all the legal facts which constitute the thread of international life—treaties, statutes, judicial decisions, of the principal countries of the world. At the same time Clunet opened his review freely to the doctrines of French and foreign theorists. Most of the new conceptions and recent developments in the modern conflict of laws have been discussed in the *Journal*, which still remains one of the best reviews of international law and the most important agent in Europe for harmonizing the practise of courts with the achievements of theory.

CLUNIAC MOVEMENT. The Cluniac movement, emanating from the abbey of Cluny during the tenth, eleventh and twelfth centuries, had as its object the restoration of the religious

life of monasteries throughout Europe. At the beginning of the tenth century monastic life was almost universally characterized by a complete relaxation of discipline, a virtual abnegation of the Benedictine Rule. Foremost among the causes responsible for this condition was the fact that control of most monasteries had passed into the hands of feudal lords or princes, who administered them directly or indirectly like any other benefices and exploited their offices and revenues. The need of a new impulse to monastic virtue was met by the establishment of the monastery of Cluny. The original charter of Cluny was granted in 910 by William, duke of Aquitania and count of Auvergne, who located the abbey in the valley of the Grosne in Burgundy and placed it under the immediate jurisdiction of the Holy See, exempting it from all other jurisdiction both ecclesiastical and secular. The papacy perceived the importance of William's offer and by a charter issued in 931 granted the monastery its special protection. Thus from the beginning Cluny was potentially the nucleus of an international institution.

The crystallization and uninterrupted spread of the Cluniac reform was favored by the fact that during two centuries the monastery came under the domination of only six abbots, each one of whom had been reared in the tradition of Cluny and had been imbued with its doctrines. In substance the Cluniac rule was a reiteration of the monastic customs instituted by St. Benedict, with the difference that Benedict's requirement of manual labor was discarded and more time allotted to prayer and devotional exercises. This rule, first well established in Cluny, began to be extended to other monasteries during the regime of the second abbot of Cluny, Odo (926-42), who has been characterized by the historian Flotard as the "savior of French monasticism." By the time of Odo's death Cluniac customs had been widely adopted in France and Italy and under his successors, St. Aymard (942-65), St. Maicul (965-94) and St. Odilo (994-1048), they spread into Belgium, Spain, southern Germany and even into Poland. This reform represented much more than an extension of Cluniac practises; it marked the evolution of an international congregation of monasteries acknowledging in greater or less degree the sovereignty of Cluny. Of the older institutions which submitted to the reform some were converted into chapters of Cluny and others were reduced to the rank of priories subject to the immediate jurisdiction of Cluny. A group of

about twenty important abbeys, boasting an ancient glory, were allowed to retain their independence and became merely "affiliated" with Cluny, which signified that the abbot of Cluny was consulted in the election of their officers and that they promised to uphold, in so far as they could, the fundamental article of the Cluniac program—freedom from secular authority. In addition new monasteries were founded in great numbers by the representatives whom the mother abbey dispatched to every corner of Europe. In some cases the feudal lords were induced to recognize the political immunity of monasteries within their territories; but with or without such recognition Cluny acknowledged no sovereign for itself or any of its dependents except its own abbot and the pope. "Cluny is an army," said Adalbero, bishop of Laon, "marching under the orders of Odilo, an army more numerous than the leaves of the Asiatic trees or the grains of sand along the shores of Africa." The animosity hidden beneath Adalbero's satire reflected the attitude of all members of the secular clergy, who saw their own prestige in the church weakening as the influence of Cluny progressed. Their rancor was hardly appeased when shortly after the succession of St. Hugh as abbot in 1049 Pope Leo IX began to regard him as his chief collaborator in a campaign for general ecclesiastical reform.

The campaign which Leo IX, Gregory VII and in lesser degree other popes of the eleventh century envisaged was essentially an outgrowth of the Cluniac movement. The success of Cluny in extruding the influence of the laity from the monastic sphere encouraged the papacy to attempt a similar reform among the secular clergy. The investiture contest waged with the empire, the battle against simony, the struggle to enforce the celibacy of the priesthood, were varying aspects of this attempt. The popes drew heavily upon the support of St. Hugh and his "army" of monks; in the congregation of Hirsau, which was affiliated with Cluny, German bishops who favored the claims of Henry IV against Hildebrand found their most intense and formidable opposition. Moreover, in demonstrating the close relation between clerical independence and the moral and spiritual integrity of the church the Cluniac reform had gone far toward preparing the Christian world to countenance the political demand of the popes. The Cluniac abbots themselves never formulated a definite antifeudal program, except in regard to their own congregation, and entered into the papal

struggle only as the "obedient and courageous defenders of the Holy See"—a phrase used by Hildebrand in 1087. But the mere fact that a large portion of Christianity had taken Cluniac life as a symbol of protest against the abuses of the feudal system made the order an enormous power in the papal war against those abuses.

The monks of Cluny were also the chief supporters of the church in the propagation of the idea of peace. Hardly less than the church itself Cluny was an international institution transcending the boundaries of fiefs and nations and unconsciously leveling antagonisms between them. The Peace of God, which aimed to protect the property of ecclesiastics and Christian non-combatants against the ravages of war, and the Truce of God, forbidding members of the church to participate in war on prescribed days, accorded well with the religious ideals of Cluny; and from the moment of their promulgation its monks did their utmost to popularize and enforce them. It was through the influence of Odilo that the Truce of God was extended in the middle of the eleventh century to include the period between Wednesday evening and Monday morning of each week. The pacifistic efforts of the Cluniacs were successful not only in France and Italy but also in Germany. At the end of the eleventh century they persuaded even the imperial court to respect the Peace of God. In the following century they engaged in a veritable campaign of peace education beyond the Rhine, attempting to propagate the idea of chivalry through the dissemination of translations of the *Chanson de Roland*.

In the course of this peace movement the Cluniacs evolved a distinction, which the church accepted, between "right" and "wrong" war. War to the detriment of Christians was "wrong"; war against the infidel was in the highest degree "right." Confident in the justice of this distinction the Cluniacs supported the crusades and the military orders which were founded to annihilate the infidel or to save Christians from his power as fervently as they supported the Truce of God in Christian Europe. When Alphonse VI, king of Castile, expressed his intention to abdicate and enter a monastery he was informed by the abbot of Cluny that his first duty was to free Spain from Islam. During the latter half of the eleventh century the Cluniacs themselves dispatched several armed expeditions beyond the Pyrenees to aid in the battle against the Moors. The crusades were first launched by a former prior of Cluny, Pope Urban II, who after his

elevation to the pontificate remained in close communication with his old monastery. Perhaps the chief intangible resource of Urban and of his successors who conducted the war against the infidel was the spirit of Christian unity which had been revived by Cluny and which caused the faithful of so many different lands to band together in the pursuit of a common ideal.

The Cluniacs were far too busily occupied to participate in the theological speculations of the time. But a summary of their social importance would be incomplete without stating that their economic organization enabled them to care for seventeen thousand victims during a year of famine; that their copying of ancient manuscripts was a connecting link between antiquity and the Renaissance; and, finally, that their architecture, the most splendid monument of which was the basilica of St. Peter at Cluny, became a model throughout Europe.

In the twelfth century signs of decadence began to appear in Cluny. Peter the Venerable, abbot from 1122 to 1156, struggled bravely against them, but by the middle of the century it was St. Bernard and the Cistercians who represented the idea of reform in the church. A hundred years later the king of France was given a voice in appointing the abbot of Cluny, and Cluny's glory was a thing of the past.

COAL AND IRON POLICE. *See* POLICING, INDUSTRIAL.

COAL INDUSTRY. Coal is one of the basic materials of modern industrialism. It supplies at present three fourths of the energy used in industry and appears directly or indirectly as an indispensable ingredient in the production of such important materials as iron and steel. It is claimed with some reason that the industrial hegemony of England was made possible in

part by the exploitation of its rich coal resources and that the same factor partly accounts for the rapid industrial expansion of Germany after 1870. National survival in time of war is also largely dependent upon coal, for it is essential in the manufacture of armaments and chemicals. There are significant instances in European history where the desire to possess certain new territory can be explained by that territory's coal resources. It was in part coal which made Belgium essential to France in 1807; it was coal which influenced France in her Ruhr-Lorraine policy during the past decade; it is coal which has made difficult the attainment of an equitable solution of the Saar problem.

The significance of coal in the world economy dates from the eighteenth century, although the technique of its mining and use as fuel were known long before that. It is believed that coal was used by the Chinese before the Christian era and by the ancient Britons before the Roman conquest. Authoritative British records mention coal in connection with certain transactions as far back as the middle of the ninth century, and there is definite evidence that by the thirteenth century it was quite generally used in Great Britain, primarily by brewers and smiths. From Newcastle, then as now an important coal marketing center, large amounts of coal were shipped to London, where part was consumed and part reshipped to the continent. As early as 1306 there were complaints about the injurious effects of coal smoke in London; in that year Edward I attempted by an ineffective decree to compel all but smiths "to eschew the obnoxious material and return to the fuel they used of old." By the sixteenth century the export trade was so developed that Newcastle coals were described in 1552 as "that thing that France can no more lyve withoute than the fyshe withoute water." About the same time the growing depletion of the English timber resources and the ensuing legislation designed to prevent the use in iron production of such timber as was adaptable for shipbuilding stimulated efforts to substitute coal for wood. The century following witnessed many unsuccessful attempts in this direction, and repeated failures led to the shutting down of iron works in many places. The coal trade remained of limited significance, and coal was used primarily as a household fuel in London.

Mining methods during these early years were crude and wasteful. Coal mines were in the main shallow bottle necked holes in the ground which rapidly filled with water. Since drainage

was always difficult and frequently impossible, mines were abandoned after a relatively short period of life. In the technical difficulties of mining was seen a potent threat to Great Britain's fuel supply, and in 1549 and again in 1552 Parliament tried to restrict coal exports lest they drain the resources of the country.

The first great impetus to coal mining came in 1709 with the truly epoch making discovery of the practical application of coal to the smelting and manufacture of iron. It has been correctly said that the most important effect of the industrial revolution in the eighteenth century was to release the iron industry from its dependence on charcoal. An endless supply of a cheap substitute for charcoal for the foundry and the forge had at last been found, with the result that the supply of cast iron increased at a phenomenal rate and was followed by a stream of iron products. From this time on modern civilization was to depend on coal for its material existence.

The second impetus to the coal trade came with the invention of the steam engine. Here the relation was a dual one. The steam engine made possible the expansion of coal mining because it enabled men to cope with difficulties presented by the depth of the mines, by water, by underground haulage distances. Coal, on the other hand, made practicable the industrial use of steam power because it was a cheap fuel and because it made possible the production of the cast iron cylinder and of relatively cheap cast iron.

The tremendous growth which followed from these inventions in the production of machinery and those goods which could be made by steam driven machines brought with it an ever increasing expansion of the coal trade. The industry's output grew from 2,148,000 tons in 1660 to 6,205,000 tons in 1770 and to 10,000,000 by the end of the century. Approximately one fifth of this amount was used in the iron and textile industries alone. During the next fifteen years the output doubled and by 1850 production equaled 56,000,000 tons. In that year the industry was employing about 200,000 miners. Coal had assumed a dominating position in modern economic life.

With the industrialization of continental Europe coal became a factor in the world's international trade. At the beginning of the nineteenth century Belgium was the only continental country with an important developing coal industry and the coal consuming countries of Europe were dependent upon Great Britain for their supplies. By 1840 British exports

reached a total of 1,606,000 tons and in 1850 they amounted to 3,800,000 tons. Coal played a dominant part in stimulating Britain's foreign trade and in the growth of her shipping and commercial leadership. It furnished a paying outward cargo to British ships, thereby cutting freight rates on imported raw materials and foodstuffs, the cost of which has played a large part in fixing Great Britain's competitive position in the world markets. Coal contributed over 45 percent of the addition of £92,000,000 to the value of British exports from 1870 to 1900.

With the building of railroads and the extensive employment of steam power in manufacturing in the second half of the nineteenth century important coal mining industries developed on the continent and in the United States. Belgium, which mined about 5,000,000 tons as far back as 1807, quadrupled her output by the end of the century. The production of France was about 4,000,000 tons in 1850 and 33,000,000 in 1900. Particularly rapid was the growth of coal mining in the countries of young and virile capitalism, Germany and the United States; by 1900 the latter was the largest coal producer in the world.

TABLE 1

PRODUCTION OF COAL IN THE PRINCIPAL COUNTRIES, 1860-1900
(Millions of metric tons)

1860	9.6	8.1	12.3	80.0	15.2
1871	13.7	12.9	29.3	117.4	42.5
1880	16.9	18.8	47.0	147.0	64.8
1890	20.4	25.6	70.2	181.6	143.1
1900	23.5	32.7	109.3	225.2	244.6

Source: Compiled from United States, Bureau of Labor, *Coal Mine Labor in Europe* (Washington 1905), and Woytinsky, Wl., *Die Welt in Zahlen*, vol. IV (Berlin 1926) p. 110-21.

The forces which brought about the rapid expansion of coal mining in the nineteenth century continued to operate in the next decade despite the increasing competition of other types of mineral fuel, such as petroleum and natural gas, and the growing utilization of water power as a source of energy. The World War provided an additional impetus to the expansion of coal mining in the countries with an established coal industry as well as in those countries which depended normally upon coal imports. The figures for coal output in the principal countries in the last pre-war year and in 1927,

the last year for which complete figures are available at present, are given in Table II.

Until the eighteenth century coal was used, mainly as fuel for household purposes, but since the industrial revolution its most important use has been in supplying energy for industry. Despite the growing use of other mineral fuels and water power for the generation of energy the coal mine still remains the only available source sufficient to meet industry's ever increasing demand for fuel. At present coal furnishes about 73 percent of the world's industrial energy. Even in the United States, where the inroads of substitute sources of energy have been particularly great, some two thirds of the mineral fuel energy used is derived from coal. The other important use of coal is as a raw material in the production of iron and steel, but despite its significance in a civilization based upon the extensive employment of these metals the consumption of coal for this purpose approximates only one sixth of its output.

The coal deposits of the world are widely dispersed. In the United States, the world's largest producer, coal is commercially mined in twenty-nine states. Great Britain, Germany and Russia have the largest coal resources in Europe, although much coal is found also in France, Poland, Belgium, Czechoslovakia, Holland and Spain. In Asia the important fields are in China, India and Manchuria. New South Wales in Australia and the Transvaal and Natal in Africa have the most important workable supplies on their respective continents.

These coal supplies vary greatly in quality. Commercial classification is based upon the content of fixed carbon, volatile matter and moisture and runs from high grade anthracite containing a very large percent of fixed carbon and little volatile matter and moisture to low grade lignite and peat, which are nothing more

than partially carbonized vegetable matter with a high moisture content. In between come semi-anthracite, closely resembling pure anthracite but with a lower fixed carbon content, semi-bituminous, bituminous, sub-bituminous or "black lignite," lignite or "brown coal" and peat; each with a progressively smaller carbon content and more volatile matter and moisture in the order named.

The great heating power and the smokeless qualities of anthracite make it an ideal household fuel; the bulk of its output is used for domestic purposes. Supplies are relatively limited and are confined in the main to eastern Pennsylvania in the United States, South Wales in Great Britain and the Donetz basin in Russia. The largest known resources are in Asia, but their great distance from markets makes them of no commercial significance for the immediate future.

The bituminous varieties are the steam and metallurgical coals. They furnish the energy of modern industry as well as the coal derivatives so essential to the production of chemicals. From bituminous come tar, pitch, sulphate of ammonia, paraffin hydrocarbons, benzol, toluene and dyestuffs. Bituminous is found in virtually all countries which have any coal resources.

The lignites, until recently little used save in those places where bituminous was too expensive, have in recent years increasingly supplanted bituminous coal. This has been particularly true in Germany, where "brown coal" has become increasingly important in the generation of electricity, the production of nitrates and the manufacture of glass. Lignite comprised about 229,000,000 tons, or 15 percent of the world coal output, in 1929. Huge supplies are scattered throughout the western part of the United States, continental Asia and Europe. It is used largely in the form of briquettes.

The combined workable world reserves of all grades of coal are today something like seven trillion tons. At the present rate of consumption this amount would meet the world's needs for the next 4000 years. This is not to say, however, that the problem of reserves is not one of vital significance. The supply of some varieties, particularly high grade anthracite, is fast being depleted as far as western civilization is concerned, and in some countries many of the better and easily accessible beds of bituminous have been exploited to an extent where further supplies can be secured only at increasing costs per ton. The workable English reserves, for example, at the present rate of output are estimated

to last but four or five centuries, and in the United States the better anthracite reserves have already been worked out. To be sure, the resources of Asia have hardly been attacked, but their location is such that they cannot be looked upon as sources of energy supply for the Occident in the calculable future.

TABLE IV

ESTIMATED WORLD COAL RESERVES
(Millions of metric tons)

CONTINENT	TOTAL	ANTHRACITE AND SEMI-ANTHRACITE	BITUMINOUS	SUB-BITUMINOUS AND LIGNITE
Europe	784,100	54,346	693,162	36,682
America	5,105,528	22,542	2,271,080	2,811,906

Coal is found in more or less horizontal seams of varying lengths and thicknesses at different depths beneath the earth's surface. When seams lie close to the surface, mining consists of removing the overlying surface soil and digging out the coal either by hand or with a steam shovel. This method, known as "open work" or "strip" mining, is practised in very few fields, for the amount of soil overlying most seams is too great to make it profitable. Although common in the Rhineland it is virtually unknown in Great Britain, and in the United States it accounts for only 4 percent of the output.

When coal lies too deep for stripping and where the general contour of the country is hilly, the coal seam may crop out on a hillside. In such cases a horizontal tunnel called a "drift" or "slope" is driven into the side of the hill and the coal brought out through this opening. Such drifts are uncommon in most mining areas outside of the southeastern American coal fields. In level country coal is usually reached by sinking vertical shafts from the surface.

The actual mining may proceed by either a "long wall" or "room and pillar" system or by a combination of both. The former is characterized by digging away the entire seam in the area worked and filling the space from which the coal has been taken by allowing the earth overlying the coal to fall and close in behind the miners as they advance or by packing in such waste rock

as comes down with the coal. "Long wall" mining is almost universally used in Great Britain and other countries and is found here and there in Illinois, Iowa and Colorado.

In the "room and pillar" method, the common method of coal mining in the United States, roads, or "main entries," are driven from the bottom of the shaft into the coal. Other roads called "side entries" are then dug from the "main entries," usually at right angles. From these side entries, in turn, "rooms" are dug out, right and left; the main output of such a mine is the coal dug out in the making of these rooms. Pillars of coal which form walls between the rooms support the ceiling above the coal during mining operations, and after rooms have been worked out as far as is safe and practicable attempts are made to extract the pillars. As a general rule, however, a fairly large percentage of pillars are left untouched with the consequence that the proportion of the coal left unmined in a given working may vary from 8 to 65 percent.

The simplest and cheapest way of getting coal from a seam is by blasting. Mere blasting, however, shatters the coal into many small pieces and fine dust, and since the commercial value of coal is in part dependent upon the proportion of lump which it contains most of the coal mined is "undercut" before it is blasted in order to enable a small blast to break the coal into large lumps. When a very high proportion of large lumps is desired, slits are cut also above the coal seams and in some instances even along the sides.

Undercutting may be done "by hand," i.e. with a pick, or it may be done by machinery. The proportion of machine cut coal has been steadily growing in all parts of the world. In the United States approximately three fourths of the coal mined today is cut by machines, 14 percent is undercut by hand and some 8 percent is "shot off the solid." In Great Britain, where the quality of the coal makes it unnecessary to do much undercutting, machinery undercuts only about 24 percent of the country's output, an amount which is about three times as great as in pre-war days. In certain British mines coal is chopped off the seam with a pick and there is no need even for the use of explosives. In the Ruhr coal fields of Germany the machine cut output is at present over 85 percent of the total, a most extraordinary increase over 1913, when less than 5 percent of the output was produced by machinery. Over 80 percent of the Belgian and

about 60 percent of the French output are obtained by machine cutting.

Once the coal is cut from the seam it must be transported to the shaft. For this purpose elaborate underground railway systems are essential. The mule in the United States and the pony in Great Britain were until the beginning of the present century the predominant motive power employed to haul mine cars from the coal face to the shaft bottom. Indeed, in Great Britain the pony is still in many cases the main source of haulage power, although he is fast being supplanted by endless ropes kept in motion by steam, electricity or compressed air. In the United States and in Germany the electric locomotive is generally used to move mine cars. Since 1920 conveyors have been gradually supplementing the underground rail haulage systems. They are particularly adaptable to "long wall" mining and their use is widespread in Germany. In the United Kingdom 12 percent of the coal output is moved by conveyors. The prevalence of "room and pillar" mining in the United States makes the conveyor less adaptable to American mines; slightly over 3 percent of the American production is conveyor handled.

In recent years loading machines which reduce the labor of hand shoveling have also been introduced into the mining industry with the result that it is possible, except for incidental cleaning up, virtually to eliminate the hand shoveling of coal into the mine cars. The use of loading machines is, however, still experimental and they are constantly being changed and improved. In 1929 these machines loaded only between 3 and 4 percent of the American output, but their significance in the industry is great because their number is fast increasing. Indeed, their capacity increased almost tenfold between 1923 and 1929.

The increased mechanization of mining has revolutionized the character of mine labor. It has transformed the miner from a skilled craftsman, working alone or with a "buddy" and wholly or partially responsible for important decisions with regard to choice of sectors for blasting and working, timbering of mines for safety and the like, to a factory hand, working in gangs, on a specialized routine subdivision of the job under the direction of foremen and experts. This change in the character of work to be performed will probably affect the status of the miner and lead to a substitution wherever possible of low paid unskilled labor on time instead of piece basis, to a jeopardizing of licensing

regulations for newcomers in the industry and to a breaking down of traditional working rules and organization. On the other hand, the occupational hazards of the miner will probably be decreased. With mechanization has come a concentration of working area, making possible better control of ventilation and a smaller time period for working each area with a consequent decrease in the possibility of accidents. The substitution of general safety standards, set by specialized experts, for the common sense decisions of the skilled craftsman whose desire for production on a piece basis put him under pressure is another factor making for a decrease in accidents.

The business organization of coal mining is on the whole similar to that of manufacturing and trade. That is, organization varies from private ownership with ruthless competition at the one end to government ownership and operation at the other. Between these extremes a wealth of intermediate forms can be found: selling associations, output and price cartels, mine operations transforming coal at the pit into coke and by-products or electric energy, "captive" mines owned by industries dependent upon coal as an important raw material. The fact that mining involves the ownership of mineral deposits to be extracted has come, however, to exercise a certain modifying influence upon the form of organization which prevails in the industry. While in Anglo-Saxon countries the ownership of mineral deposits has since the time of Elizabeth been vested in the surface owner, on the continent it is vested in the state. It must not be inferred that public ownership led necessarily to government operation: the exploitation of deposits was generally carried on by private enterprise under a government concession, and in the German states from the sixties to the beginning of the twentieth century the right to free prospecting was generally coupled with the grant of a property right in the deposits to their discoverer. In Great Britain and the United States the competitive pattern has been predominant, while on the continent government regulation is more thorough and extensive. In some continental countries, such as Holland and Prussia, a number of coal mines have for some time been operated by the government.

Mining involves an unusually high proportion of fixed capital investment and the unregulated competitive form of organization has not proved particularly suitable to the coal industry. Closing a mine exposes it to the possibilities of

caving, floods and other forms of deterioration and may even involve a complete loss of investment. It is frequently cheaper therefore to run a mine at a loss than to shut it down. Nor can capital once invested be easily withdrawn, since a mine cannot be turned to other uses. The common practise in the industry, therefore, is to continue producing at a loss, for owners can for a time more easily cope with small losses from sales at low prices than with the larger losses which might follow the closing down of their operations.

Conditions are made even more chaotic by new mines which are continually coming into operation. The desire to cut fuel costs, for example, leads to the opening of new mines adjacent to the larger consuming centers, irrespective of the surplus capacity already in existence elsewhere. The opening of new railroads into undeveloped coal areas, the possibilities of securing new markets as a result of readjustments in freight rates, the existence of low wage rates for labor in a given locality—all these play their part in bringing new mines into operation or in expanding the underground operating area in mines already in operation.

As long as the demand for coal kept growing at the compound rate of 4 percent a year, as was true during the generation preceding 1920, the product resulting from this planless expansion of capacity was with minor exceptions steadily absorbed. But with the World War the situation was changed. The interference with the free movement of coal stimulated the use of substitutes in some countries and in others it resulted in the maximum development of the existing coal resources. Thus capacity was tremendously increased at a time when forces were developing which were to check the steady growth in demand that had been characteristic of the past. In recent years the coal industry has been suffering from overcapacity throughout the world. It has been plagued almost everywhere with irregularity of production, overmanning and unprofitableness. In Germany the margin of surplus capacity is estimated to be about 25 percent, in the United Kingdom capacity is a third to a fourth larger than output and in Poland and the United States it is almost 50 percent larger.

The difficulties from which the coal industry suffers are particularly evident in Great Britain. In the early years of the industry's history the growing demand for coal brought unending profits to the British mine operators, who were

generally the local aristocracy that owned the land under which coal was mined. In some areas where coal cropped out on the surface or was easily accessible, as in Staffordshire and the Midlands, small capitalists worked the shallow shafts on coal lands leased from owners under a royalty system. Later, leasing became general and funds raised through joint stock companies came into the industry. By and large, however, much of the expansion came through the reinvestment of the profits which came out of the mines, with the result that many of the larger operations today are still dominated by the same families which were active in mining two or three generations ago.

The coal owners of Great Britain have always been highly individualistic. Such formal relations as they have had with each other have been in the nature of organizations for mutual protection against labor unions and social legislation rather than for the coordination of activities in the conduct of their industry. The steady growth of the industry following the constantly increasing demand for its product both at home and abroad gave no occasion for modifying existing practises, and attempts to change managerial or marketing methods have always been opposed as unnecessary. Such matters as difficult natural conditions or inefficient underground haulage were until recently of little concern to the coal owners, for they were concealed by the continually increasing profitability of the industry. Over a period of thirty years the industry had never had an extended depression. Every drop in output had been followed within a year by a recovery which outran the highest production of preceding years, while the margin between costs and market value steadily grew. From the mines of Great Britain at the outbreak of the World War came some \$65,000,000 a year in the form of profits and approximately \$30,000,000 a year in royalties. From these mines also came the livelihood of 1,118,000 miners and their families—almost 10 percent of Great Britain's population—a livelihood, incidentally, which was substantially higher than that of other wage earners in the country.

The product of the British mining industry has always been distributed by middlemen, for the coal owners have held distribution to be beyond their province. Although a considerable amount of coal is sold by the mines directly to the consumer, more than one half of the output frequently goes through three or four hands before it reaches its final destination. Some 2000

wholesalers or factors purchase the product from the mines and then resell it either to large consumers or to the 27,000 retailers. Occasionally the retailers resell to each other or to hawkers who vend on the streets a fairly considerable portion of the coal used for domestic heating in some of the larger cities. Foreign sales are in the hands of exporters who maintain their own sales agencies at the various ports and frequently at certain continental purchasing centers. They are in the main brokers whose function it is to place prospective purchasers in contact with mines, arrange for shipping, financing, etc. In most cases they do not confine their attention to the exploitation of coal alone, the majority being interested also in the coastwise coal business, shipping, brokering, lumbering and other activities.

The disadvantages arising from the complete separation of the marketing and mining activities of the industry have long been the subject of criticism. The small mines are frequently at the mercy of the coal merchant, who controls mine prices by setting mine against mine in a system of price cutting competition. During 1927 and 1928 some attempt was made to remedy the marketing situation by the formation of district selling associations. Some of these undertook to regulate the amount of coal sold by their members in the home market, with the idea of raising domestic prices, and others to regulate the output of the member mines and to subsidize the export trade with the proceeds of a tax levied on all coal produced. Still others were associations which merely fixed minimum prices. Thus far these schemes have not proved very effective. None of them includes all of the producers in their respective districts, and independent mine owners are always free to upset the calculations of the marketing organization. The schemes, moreover, are local in character; they cover only certain districts and make no provision for the elimination of interdistrict competition. That some sort of coordinated scheme may soon come into existence is evidenced by the interest of the present British government in the problem of coal marketing and its intimation that, if necessary, the establishment of marketing organizations may even be made compulsory. Once some sort of agreement among all the mine owners is attained, a national selling organization may become possible, at least for the export trade, and may extend eventually to the domestic market.

The history of labor in the British coal industry has been most checkered. At times the

industry has presented a picture of callousness and brutality unequalled anywhere in modern times. The employment of women and children as beasts of burden underground, a system of indenture, a fourteen-hour day, all have prevailed at one time or another in the British mines. The elimination of these conditions has come only after years of battle on the part of the miners, and such improvements as have been attained have usually been incorporated into the routine of the mine by way of parliamentary statutes. Indeed, the first of the working class members to be sent to the House of Commons were miners' leaders.

Although organization has prevailed among the miners for several generations it was until 1908 primarily local in character. Not until that year was complete national unity in the form of a federation of the district unions achieved, a unity which culminated in the attainment of the passage of a minimum wage act in 1912. Throughout the greater part of their existence the miners' unions have been advocates of the nationalization of their industry, a creed which has been an integral part of their program and which was deemed of sufficient importance in 1919 to justify their attempting the organization of a general strike for its realization. It is today more than ever before to the Miners' Federation of Great Britain the sine qua non of an efficient and prosperous mining industry.

The belief in the efficacy of nationalization has been made particularly firm by the distressed state of the mining industry throughout the decade following the war. During that period the development of many mining areas abroad, the growing substitution of fuel oil and hydroelectricity and the active competition for export markets by countries which in the past were themselves consumers of British fuels have all cut into Great Britain's ability to sell coal for export. In the home market the increasing efficiency in the field of coal utilization and the decline in iron and steel production have seriously curtailed sales. Annual production during the decade, despite several world fuel shortages in the interim, did not come within 10,000,000 tons of the output of 1913 and has consistently run from 11,000,000 to 50,000,000 long tons below the 287,000,000 ton production of that year. At the same time there has been a fall in coal prices, and despite the fact that costs have been lowered by increasing the length of the miner's working day and by curtailing the number of workers on the industry's pay roll to

the extent of 200,000 few of the mines have been able to operate on a profitable basis.

In 1921 the entire economic structure of Great Britain was shaken by the "most serious stoppage in British industry"—a three months' strike waged by the miners to protect the prevailing wage level. In 1926 Great Britain was for a short period in the throes of a revolution waged by organized labor in the form of a general strike called to assist the miners in their fight against a wage reduction, an increase in working hours and the denial of their rights to negotiate wage agreements on a national basis. Neither of these struggles was of much avail against the determined refusal of the mine owners to readjust their industry to changed circumstances, an action which was essential to maintaining the gains for which these battles were fought. The miners were left impotent and are unable to bring about the realization of any far reaching changes. Without legislative compulsion there appears to be little hope of bringing to pass those radical changes which might put the British coal industry into a position of such moderate prosperity as might make possible a return to the conditions of work and wages which the British miner formerly enjoyed.

Coal mining has for several generations been better organized in Germany than in other countries. In the early days the mines were the property of the royal or noble families. Later, under Frederick the Great, the industry was fostered by the granting of mine concessions and certain tax exemptions. In 1780 the Prussian government undertook to regulate coal mining within its borders by fixing prices, providing for the installation of equipment and generally improving productive conditions. With the development of the railroads after 1850 the growing demand for iron products became reflected in the demand for coal and thus stimulated production. The railroads also made available new markets in districts to which coal had never before been shipped. Thereafter the mining industry experienced a rapid growth, surpassing in its rate even that of Great Britain.

The fine coking qualities and high volatile content of the Ruhr coals provided the basis for a great iron and steel center in that area. Originally the metallurgical producers were dependent upon the coal owners for their fuel supplies and the iron merchants were to a considerable extent at the mercy of the coal industry. The production and sale of coke were under control as far back as 1882 and prices

were more or less rigidly fixed. To free themselves from this control the metallurgical producers began in the eighties to acquire mines of their own and thus to furnish their own fuel requirements.

Overexpansion and falling prices during the seventies led to an organized attempt to eliminate competition in the German coal export trade, and in 1877 the Westphalian Coal Export Association was formed. Although it accomplished little more than to secure some orders for coal from the German navy and obtain lower freight rates for its product from the state railways it was the forerunner of organized control in marketing. In 1878 the National Mining Association made the first of the numerous attempts to control, through production agreements, the output of the entire Westphalian coal area, but due largely to the looseness of its agreements and the many reservations and exceptions contained therein it was not very successful in accomplishing its ends. In the next decade the Coke Association, created at first to regulate the price of coke produced in the Dortmund mining district, soon developed into a selling syndicate with the exclusive right to sell the coke and coal produced by its membership. And in 1893 came the first Rhenish-Westphalian Coal Syndicate, which in a sense was the precursor of the marketing organization prevailing in the German coal industry today.

The purpose of the Rhenish-Westphalian syndicate was to control the coal market by the elimination of competition between the Ruhr producers. Control was exercised through a selling organization to which all members of the syndicate delivered their allotted outputs at an arranged price. The product was in turn sold through a single sales agency and profits distributed in accordance with respective outputs. In disposing of the product the syndicate maintained two price policies. One was for territories where it did not have to meet the competition of fuel from other coal fields and where accordingly rigid prices provided an assured remunerative return. In other markets prices were freely cut and the syndicate used any means at its command to combat competition. To insure adherence to the terms of the syndicate's agreement, particularly to those clauses which fixed the size of the output of the respective members, fines and penalties were imposed for violations.

The syndicate agreement, which was to expire in 1903, was renewed with considerable modification and remained in force until 1916. The

syndicate succeeded in raising prices, in some cases to unwarranted heights, despite the fact that it was held in check by the Prussian fisc, which sold a part of the output of its Ruhr mines in competition with the syndicate. The syndicate policy led also to the purchase by larger coal operators of small mines in order to profit by the quotas allotted to the latter, to the acquisition of coal mines by iron and steel companies and to a considerable increase in the output of independent mines. It was anticipated that the conflicting interests of these groups would prevent the renewal of the agreement, a contingency which was not welcomed even by the government because the syndicate had succeeded in stabilizing the industry and regularizing the employment of miners. In July, 1915, the federal government therefore promulgated a decree enabling the states to make coal syndicates compulsory unless agreements covering no less than 97 percent of the output be established voluntarily; under this threat the syndicate agreement was renewed. With the growing acuteness of the coal shortage particularly detrimental to the interests of small consumers the government created in 1917 an official machinery for rationing the distribution of coal which reduced the syndicate and the middlemen to the position of government agents.

The Treaty of Versailles left the German coal industry in a highly disorganized state. Germany lost the Saar district, a large part of the coal in the Aix-la-Chapelle field and after 1922 about nine tenths of the coal reserves of Upper Silesia, a total of more than one fourth of her pre-war reserves. In addition she was compelled to deliver to the Allies as reparations some 40,000,000 tons of coal per annum, a requirement which she never entirely fulfilled. She did, however, deliver between 15,000,000 and 18,000,000 tons annually until 1923, when she was declared in default and French and Belgian troops temporarily took possession of the Ruhr. For eight months the economic life of the Ruhr was at a standstill and coal production fell from the 1922 monthly average of 8,000,000 tons to an average of 2,000,000 tons. The necessity of meeting reparation requirements as well as the requirements of the home market and the additional need of regaining foreign markets to pay for imports, coupled with the fact that the German coal resources were reduced, made it essential that radical measures be adopted for the reorganization of the industry.

Important steps were taken as early as 1919,

when the attempted socialization of the coal industry resulted in the creation of an apparatus for a radical reorganization of the fuel economy of the republic. In accordance with the law of that year the coal mines of Germany are grouped into ten compulsory coal syndicates and one coke syndicate, which are modeled closely after the Rhenish-Westphalian syndicate. Together with the states operating mines these syndicates form the Reichskohlenverband, which fixes production quotas for its members and maximum prices for their products. Over and above the Verband is the Reichskohlenrat, whose membership includes the representatives not only of mine owners and miners but also of shipping, transport and other important coal consuming industries. Its function is to formulate general policies for the industry and to supervise the activity of the Verband to the extent of vetoing its decisions by making representations to the minister of national economy, in whom final control is vested. While later developments reduced the importance of these organizations for the industry, the ability of the government to intervene at any time through the agency of the compulsory syndicates is a stabilizing factor in the situation.

Since the marketing machinery had been provided for by earlier legislation, the main attack after 1924 has had to be made on the organization and technique of the production sector of the industry. Domestic requirements, particularly those of power plants, were met to a large extent by the increased use of lignite, the production of which has grown from 85,000 tons in 1913 to 175,000,000 tons in 1929. In the bituminous branch of the industry, where the loss of resources was most acutely felt, concerted action brought about a complete overhauling. As a result the output of coal mines which Germany retained after the war was raised from 141,000,000 tons in 1913 to 163,000,000 tons in 1929. By 1925 she had regained 22,000,000 of the 35,000,000 tons she exported before the war, and through the aid of the British coal strike her sales abroad (excluding reparations) in 1926 almost equaled the banner year 1913. In 1929 she exported 28,000,000 tons.

"Rationalization" has been the watchword of the day. Amalgamations and the purchase of quota allotments have led to the closing of surplus and high cost mines, and production has been concentrated in low cost operations. In the Ruhr, where normally 80 percent of the bituminous coal and 95 percent of the coke of the

country is produced, 77 undertakings normally employing 60,000 workers were shut down in a single year. The number of operating companies in that area is now less than 70. This relatively small number of companies with 175 mines produced 152,000,000 tons in 1929, a significant achievement when compared with the British coal industry, where 1400 companies with 2100 mines produced 240,000,000 tons.

Next came the reequipment of the mines. Wherever possible mechanical energy was substituted for human labor. Within a few years the energy used in running mining machines rose from 4 to 15 horse power per hundred workers and that used in operating such hand implements as compressed air picks grew from 8.5 to 42.5 horse power per hundred miners. Conveyors came to be almost universally used at the coal face and electric and compressed air locomotives entirely supplanted the mine pony on the haulage systems. Automatic equipment for handling coal cars at the shaft and improved cleaning, grading and washing machinery, which increased the efficiency of the labor employed on the surface from 50 to 70 percent, were generally installed. In fact, every detail of coal production even to the equipment of repair shops was modernized.

Coal utilization was also modernized. Mines became "coal using factories" and the production of coke, by-products and power became an integral part of mining. Between 1925 and 1928 the installation of new coke ovens increased the production of coke in some plants by almost 100 percent, without any increase in labor forces. Markets were sought for by-product gas, and long distance pipe lines now extend for hundreds of miles from the coke ovens to the consuming centers of Westphalia and the Rhineland.

Lower production costs, achieved mainly as a result of technical improvements, involved also sacrifices on the part of mine labor despite the fact that it is strongly organized. Since the early nineties there have existed in the coal industry two trade unions operating on a national scale, the "free," or Social Democratic, and the Christian. In the early post-war years Communist unions secured considerable power and the free union reached a peak membership of 467,000, far outnumbering the second strongest group, the Christian unions, which had a membership of 155,000. Even after the period of rationalization, when labor forces were considerably reduced, the membership of the free union remained at 285,000, a figure which com-

pires favorably with the 104,000 membership of 1913. Moreover, the miners have been well represented on the coal syndicates and in the Reichskohlenrat. Nevertheless, labor was forced to rescind the gains made in the revolutionary period in the length of the work day of surface workers and to consent to a wage scale which is below that of Great Britain, even when allowance is made for the differences in the cost of living and such supplements to wages in Germany as the services provided by social insurance and municipal agencies.

European coal fields outside of Germany and Great Britain have until recently been of limited significance. France is the largest of these continental producers, with an output (including Alsace Lorraine) of approximately 52,000,000 tons. The bulk of this output has come from the mines of Nord and Pas de Calais, which have furnished about two thirds, and the balance from the mines of central and southern France. During the World War the mines of Nord and Pas de Calais were destroyed, and at the termination of hostilities their output was but 12 percent of the pre-war average. In reconstructing this area the mines were completely rebuilt and modernized and they now turn out over 20 percent more coal than before the war. Mechanical equipment has been installed and more than 60 percent of their output is machine mined. Particular attention has been given to electrical generation at the mines, and surplus power is sold as far away as Calais, a distance of fifty miles. The entire output of this district, both the coal coke and by-products, is marketed by a central selling agency. There is also a common organization of mine owners for the purchase of mine timber. The other mining districts have organizations for the study of markets, and despite the absence of a formal selling syndicate for the entire industry there is sufficient co-operation between the various districts to make possible a large degree of price stability.

Before the war more than one third of the coal used in France was imported; almost 20 percent came from British sources. In the past ten years French coal consumption has increased substantially despite the fact that hydro-electrical developments generate enough power to supplant between 12,000,000 and 18,000,000 tons of coal. France has drawn on reparation coal from Germany and on annexed coal resources in Lorraine. Yet she has not been freed from dependence upon foreign countries for the coking coal used in her blast furnaces. Indeed,

owing to the fact that the returned provinces consume nearly three times as much coal and coke as they produce, she is more dependent than before upon foreign sources. Nor can the Saar, which is under French control, furnish the necessary requirements. For Saar coal has poor coking qualities and the general region itself consumes whatever coke it produces.

Poland, with an output of 46,000,000 tons in 1929, is the fourth largest coal producer in Europe. During the first seven years after the war her industry was in a depressed condition and despite the acquisition from Germany of the coal resources of Upper Silesia her production was consistently below that of pre-war years. As elsewhere the tie up in the British coal fields in 1926 gave a fillip to Polish production and in 1928 the volume of her output attained its earlier high level, while in 1929 she surpassed it by 6,000,000 tons. This growth was mostly due to a large increase in her exports. Foreign sales of coal comprise in value over 13 percent of the total of all goods sold abroad, a percentage more than twice that of any other coal exporting country. The Polish government regards the development of its coal industry as a national necessity, and exports, particularly to Scandinavian and Baltic markets, are subsidized by the remission of coal taxes, railway rebates and fixed remunerative prices on the home market, a policy which has seriously curtailed British exports to northwestern Europe. The marketing is controlled by a central organization which regulates the rail deliveries of coal both within the country and to certain foreign destinations, fixes prices and imposes fines upon those mines which fail to observe formulated regulations.

Although small in area Belgium is the fifth largest producer of coal in Europe. Before the war her annual output averaged approximately 23,000,000 tons and her internal consumption amounted to 24,000,000 tons. Since the quality of her own coal is such as to make it of no value to her largest coal consumer, the iron and steel industry, Belgium exported about one third of her output and imported an equal quantity of coking coal. Good coking coal has been recently found in the Campine coal fields in northern Belgium and developments of new mines with large capacities are making the Belgian metallurgical industries less dependent upon foreign sources. Production did not greatly increase in the post-war decade and output has never surpassed 27,500,000 tons, the production for 1927. Consumption, due to the expansion of the iron

and steel industry, has about doubled since the war. The difference has been made up by reparation coal, purchases from Great Britain, Holland and France and private purchases from Germany.

The technical equipment of Belgian mines has been greatly improved in the recent past; 81 percent of the output is machine cut and the production per man has been increased by nearly 10 percent in the southern coal fields, from which the bulk of the output comes. Privately owned royalties were abolished in 1928 and other methods for reducing costs have been inaugurated by the government in the form of low mine taxes, controlled imports and reduced freight rates on long haul shipments. In 1929 a central coal selling agency was created for marketing the Belgian product.

Considered from the point of view of relative growth the Dutch mining industry presents the most spectacular picture in Europe. Early in the twentieth century Holland launched a program of mine development through state operation in order to escape the domination of private concessions by foreign capital. Since then the industry has steadily increased its production at a rate unsurpassed on the continent. In terms of coal requirements the country is now virtually self-sufficient, while before the war the Dutch market was largely supplied by competing German and English producers. An appreciable amount of the special quality coal is still imported, but it is offset in considerable part by the export of other qualities.

The new state mines, which produce over 70 percent of the country's output, are among the largest and most modern in Europe. Some have been exploited for a short time only and their output will be considerably increased in the near future. Special preference, varying from 10 to 25 percent of the normal freight rates, is given to coal originating in the Limburg district, where state mines are located. Two thirds of the country's output is sold through a single marketing agency and the balance distributed by independent dealers.

Russia's coal resources are the largest in Europe and her fields are the potential source of a tremendous production. Russian mines supplied approximately three fourths of the domestic needs before the war. During the war and particularly in the years 1918-21 the output fell catastrophically, amounting in 1921 to less than one third of the normal. The Soviet government, which operates the mines as well as

the other important industries, had a difficult struggle in its reconstruction work, the principal difficulties being the dispersal of labor and of the technical force and the dilapidated condition of mine equipment. While considerable quantities of timber and oil are used as fuel, Russian industry is largely dependent upon coal from the Donetz basin. As a result of tremendous efforts on the part of the government new equipment is being increasingly installed in the mines of that region, so that 23 percent of the Donetz output by 1928 was machine mined as compared with the pre-war figure of 1 percent. Considerable quantities of lignite are being mined in other parts of Russia and used at the pit in the generation of electrical power, which is looked upon as a basic factor in the success of the Soviet economic system. Although until 1930 coal production in the country as a whole did not keep pace with the output program set for the industry, because considerable difficulty had been experienced in securing an efficient and stable labor supply, it is steadily growing and has already attained a level of some 34,000,000 tons, which is 5,000,000 tons more than the output of 1913 in the areas now retained by Russia. A limited export trade in coal has also been developed; the major portion of the foreign shipments go to Italy. Some anthracite has been shipped even to the United States, where complaints have been voiced about the dumping policy of the Soviet government.

The decided movement in the less important coal producing countries of Europe toward supplying as far as possible their own fuel and power requirements has brought about an appreciable growth in the productive capacity of the continent. Although these countries are still dependent upon outside sources for their supplies of special types of coal, their purchases abroad have fallen appreciably. Outside of Europe there has also been a decided expansion in coal output, and Pacific markets, largely supplied by Europe in the past, are receiving increasing quantities of coal from nearby sources. The result has been a contraction in the foreign sales of Great Britain and Germany, where the successful operation of a large portion of the mining industry has been dependent upon them. It is likely that many of these war and post-war changes in the distribution of production will remain permanent and, if Russia succeeds in her coal expansion program, will even be intensified. Should this prove true, the coal industry of Europe is destined to remain in a disorganized

condition for many years, and countries like Great Britain will have to continue operating on a restricted scale, at least until such time as their domestic consumption becomes equal to the unused capacity of their mines.

On the continent of Asia coal production is still in its infancy, the total Asiatic output constituting only about 6 percent of the world's production. Of the three principal coal producers in Asia, China, India and Japan, China is richest in resources. The Chinese anthracite reserves are the greatest in the world, but her anthracite output is used merely for household heating in the larger cities. In recent years it has been gaining a foothold in the transportation markets, and river shipping is beginning to consume anthracite for steam raising. Mining is concentrated in the hands of a relatively small number of large operators, one company in northern Honan mining about 5 percent of the country's total output. Bituminous coal is used in China exclusively for the production of power, and this coal is mined only at points adjacent to railroads. Here too large producers dominate and as much as 4,500,000 tons are produced annually in the operations of a single organization. The total output of the country averages about 20,000,000 tons, or 7,000,000 more than in 1913. Exports average around 3,000,000 tons, but these are offset by imports about equal in size to sections of the country inaccessible to the domestic product.

Coal has been used in Japan for centuries, but prior to the opening of the country to the culture of the Occident it played no part in the economic life of the country. The last quarter of the nineteenth century witnessed a great growth in the use of coal, so that at the outbreak of the World War over 21,000,000 tons were coming from the mines of Japan and about 4,000,000 tons were being exported abroad. The growth in the industrial output of the country and the difficulties experienced in securing foreign fuel supplies stimulated coal production during and immediately after the war. The increase in output averaged over a million tons a year. Like all other mineral resources coal is reserved to the state in Japan and mining is in the hands of private companies who operate under a government lease.

The Indian output has remained more or less static during the past decade and equals about 22,500,000 tons, or about 6,000,000 tons more than before the war. It is consumed primarily by

the manufacturing and railroad industries and a considerable amount is sold for ship bunkers. Export and bunker sales comprise over one seventh of the total output.

The coal fields of the United States contain every known variety of coal. As has been said above, anthracite is confined to an area of less than five hundred square miles in northeastern Pennsylvania. The major bituminous areas are the Appalachian region extending from northern Pennsylvania into Alabama and the eastern interior region comprising Illinois, Indiana, Ohio and western Kentucky. These regions have a well nigh inexhaustible supply of high grade coal and together produce about 90 percent of the coal mined in the country. The balance comes from coal beds scattered over the middle western states, Texas, the Rocky Mountain area and the northern plains, the latter containing large deposits of lignite.

Due to the difference in the geological make up and the use made of their products anthracite and bituminous mining must be considered as distinct industries. Anthracite is used primarily as a domestic fuel, although some 30 percent of the output competes with bituminous in the industrial market. Because household consumption is less affected by industrial variation and because the historical development of the industry was less disorderly and anarchic, anthracite production is more stable than bituminous. In the early days of the industry railroads were built as adjuncts to anthracite mining and since then there has remained a close relationship between the transportation agencies and the mining companies. Indeed, at one time the railroads mined some 73 percent of the tonnage produced and controlled over 90 percent of the available reserves. In 1920 there were 174 producers owning 374 producing units in the anthracite industry; 13 of these producers contributed 79 percent of the total output. This centralized ownership made possible more rational development as well as a more effectively controlled output than has ever been possible in bituminous mining.

With the exception of abnormal years of labor difficulty the output of anthracite remained almost stationary from 1913 to 1926. Since then there has been a decline in consumption. Production failed to equal the average of other years, and from 1927 to 1929 the output for each year was progressively smaller. The 1929 output of about 75,000,000 tons was the smallest on

record for any year free of labor disturbances over a long period.

The cause for this decline is to be found in the substitution of fuel oil and manufactured gas in the heating of households. In 1928, for example, 60 percent more fuel oil was consumed in household heating than in 1926. Fuel oil has also made inroads into coal consumption in the heating of other types of buildings. Much of this substitution has been caused by the greater convenience in the use of fuel oil. Some portion of the change, however, is to be attributed to the desire of the household owner for an assured fuel supply, something which has not always been possible for anthracite consumers. Twice within the past decade the anthracite supply has been curtailed by labor disturbances, and although during periods immediately following it has appeared that the industry has regained the majority of its customers an appreciable portion was never recovered. To counteract this decline in anthracite consumption organized efforts have been recently made for careful cleaning and sizing of coal, and the industry has made available engineering forces for training retail dealers in the fundamentals of combustion. Indeed, it has gone so far as to serve anthracite consumers directly in solving their heating problem.

The anthracite industry employed in 1929 154,000 men, a decline of 9 percent since 1926. The anthracite miners are virtually all members of the United Mine Workers of America and constitute the only large group in the American coal industry which has retained its solidarity. The beginning of their organization was laid in the anthracite strike of 1902, which was largely financed by the bituminous miners. For a decade thereafter the anthracite locals were still weak and unable to hold their membership. The award of the Anthracite Coal Commission in 1903 failed to provide for a closed shop, and the arbitration machinery set up on the basis of the commission's decision was not satisfactory to the miners. Even after 1912 the demands for a closed shop and for a change in the arbitration machinery persisted and were important factors in the prolonged strikes of 1922 and 1925, the latter of which was terminated by a five-year agreement. Recognizing the need for steady production if the industry is to retain its markets the miners negotiated in 1930 a new wage agreement covering a period of five and one half years; at this time their demand for a closed shop was finally granted in the form of the check off system of collecting union dues.

The American bituminous coal industry has been described as the worst functioning industry in the United States. Although its rated annual capacity has been as high as 970,000,000 tons and the maximum attained output 579,000,000 tons (1918), there have, nevertheless, been four occasions since 1917 when threats of a coal shortage have been so menacing as to cause the federal government to undertake the rationing of the supply. The immediate causes of these shortages have been labor disturbances and railroad car shortages. These, however, have been but the surface evidences of more important forces. The real causes lie in the organization of the industry, the character of our bituminous resources, our legal concepts of property rights in natural resources and our blind insistence on competition irrespective of its results.

TABLE V

PRODUCTION AND CAPACITY OF BITUMINOUS COAL MINES IN THE UNITED STATES, 1913-1929

(Millions of net tons)

YEAR	PRODUCTION	CALCULATED CAPACITY*
1913	478	635
1914	423	668
1915	443	672
1916	503	673
1917	552	699
1918	579	717
1919	466	736
1920	569	796
1921	416	860
1922	422	916
1923	565	970
1924	484	871
1925	520	822

The demand for coal is seasonal, and since coal cannot be economically stored at the mine the industry works spasmodically. For over a generation the capital invested and the labor employed in bituminous mining have been idle on the average 93 working days in every calendar year. Moreover, the industry's capacity and labor force have always been larger than any immediate needs would justify. Competition for coal traffic has led the railroads to open new fields to be exploited, and strikes and high wage rates in union fields have encouraged the

opening of new mines in districts where labor is not organized. The desire to be assured of a cheap supply of fuel has led many railroads and large industries to open their own mines, thereby further swelling existing capacity. These "captive" mines produce as much as one fifth of the country's output. A system of mine rating which compels a railroad serving a coal field to put in a siding and supply coal cars for every new operation still further aggravates the situation, for the opening of new mines has meant that the available supply of cars has had to be distributed among a larger number of operations. In times past this has frequently meant that in periods of great activity, when there have not been sufficient cars available to meet the total requirements of the coal fields, the newer operations have secured cars at the expense of the old and irregularity of operation has thereby further increased. Finally, capacity has been increased by the increasing use of mechanical devices in the coal mines. Coal cutters, conveyors and loaders, used in conjunction with more efficient mine layout and underground transportation systems, have increased both capacity and output without at the same time increasing the number of operations in existence.

All of these forces have led to a situation where in a single year, 1920, there were approximately 15,000 bituminous mines operating in the United States. Of these almost 4500 were so-called wagon mines with a total annual output of 4,500,000 tons, and 1440 were local workings with an average production of less than 300 tons each for the year. These 6000 mines together produced less than 1 percent of the total output of the country. The remainder of the coal, 563,000,000 tons, was produced by 6277 operators working 8921 so-called commercial mines having direct facilities for loading their output into railroad cars. The latter varied in size from operations totaling only 2000 tons a year to others with an annual output of 5,000,000 tons or over. The bulk of the production, approximately 500,000,000 tons, came from the larger units, 4147 in number, with an average annual output of over 50,000 tons. Of these, 1732 mines, or 11.7 percent of the total number of mines, turned out two thirds of the total coal produced.

The post-war decade witnessed a radical decline in the American production of bituminous coal. Output has never equaled the maximum of 579,000,000 tons attained in 1918, and in only one year, 1926, when the world was cut off from British supplies by the miners' strike,

has the industry come within close distance of that figure. Had the rate of growth experienced before the World War continued, the production in 1927 would have been some 680,000,000 tons. The actual output in that year was only about 518,000,000 tons.

The failure of production to regain its former heights, despite the steady growth in the industrial output of the United States and an increase in energy consumption of about 17 percent, can be explained by several factors. The first has been a growth in the use of oil, gas and hydro-electric power as sources of energy. The second has been the great improvement in the efficiency of fuel utilization. Finally, there has been a slight decline in exports.

In terms of heating value bituminous coal furnished 52.6 percent of the energy consumed in the United States in 1929 as compared with 66.0 percent in 1920. The proportion of energy supplied by oil, on the other hand, grew from 15.0 percent to 24.6 percent, and by natural gas from 3.8 percent to 7.6 percent. The contribution of water power to our energy consumption increased during the same period from 5.0 to 7.9 percent.

In the field of fuel utilization the consumption of coal per unit of work performed has radically declined. Between 1919 and 1928 the railroad industry, which absorbs about 24 percent of the bituminous supply, cut its consumption per thousand gross ton miles of freight service by 25.3 percent. The consumption of electric power plants per kilowatt hour fell by 45 percent, and in the iron and steel industry the consumption of coal in making a ton of pig iron declined by 14.6 percent. In the general manufacturing industries a similar tendency has prevailed: the total coal consumption between 1909 and 1923 increased by 30 percent, while the output of manufactured goods grew by 64 percent.

The falling off in coal consumption during the ten years ending with 1930 was reflected in a rather marked change in the size and organization of the bituminous mining industry. The number of mines in the industry was radically cut and 1928 saw 6450 commercial mines in operation, a number which was 2881, or 30 percent, less than that in 1923. With this change came also a shift in the number and importance of the larger mines supplying the country's needs. The number of mines producing over 200,000 tons per year increased from 748 to 773, and their production, which comprised 47.2 percent of the country's output in 1923, grew to

60.7 percent in 1928. The shrinkage in numbers and output was confined mostly to mines with an output of from 10,000 to 100,000 tons. Concurrently came a sharp drop in the employment of workers, whose number declined by 26 percent as compared with a contraction in output of about 12 percent in the same period. This difference is to be accounted for by the growth in the number of larger mines, which, in effect, has meant the discharge of the entire working force in abandoned mines and the shift of part of their output to larger operations, a shift which necessitated the employment of but few additional workers by the latter. It is to be explained in part also by the development of mechanization in the mining of coal, as evidenced by the growth in machine cutting from 66.9 percent of the total in 1923 to 73.8 percent in 1928. The effects of both these sets of forces are revealed in the production per worker, which at 4.73 tons per day in 1928 set a maximum record for the industry.

TABLE VI

DAILY OUTPUT PER WORKER IN BITUMINOUS MINES,
UNITED STATES, 1920-1928

(Net tons)

YEAR	OUTPUT
1920	4.00
1921	4.20
1922	4.28
1923	4.47
1924	4.56
1925	4.52
1926	4.50
1927	4.55
1928	4.73

Bituminous coal reaches the market through various channels, of which the most direct are sales from the mine to industrial consumers and retailers without the intervention of an intermediary. The smaller mines, however, cannot maintain sales agencies and they must seek an outlet for their product through wholesalers or jobbers. These dealers either buy the product of the mine outright or act as agents for producers on a commission basis. They rarely if ever actually handle the coal they sell. The larger portion of the mine sales to consumers and intermediaries is made on contract covering deliveries for six months or more, and over 70 percent of the tonnage is disposed of in this fashion. Almost one half the tonnage handled by independent sales agencies is purchased under long time

contracts. Sales of this sort have a tendency to make more regular the operations of the industry, and diversion from this practice tends to increase new mine development and irregularity. Contract sales also make for a steadiness in price. Indeed, in times of runaway markets it is the "spot" portion of the output, i.e. such coal as is not subject to contract, which furnishes abnormal profits to the operator and the wholesaler.

TABLE VII

CONSUMPTION OF BITUMINOUS COAL IN THE UNITED STATES BY USERS

USERS	
Railroads	27.7
Coke ovens	16.0
Electric utilities	7.7
Steelworks	5.4
General manufacturing	19.5
Gas works	1.0
Mining and quarrying	1.9

Little of the bituminous coal produced in the United States is exported abroad. In the abnormal years 1920 and 1926, when Great Britain was unable to meet the requirements of her customers, exports from the United States exceeded 35,000,000 tons and were about twice the average. Even this amount, however, was but 6 percent of our production as compared with over 20 percent which Great Britain exports even in years of depression. In normal years American bituminous exports run under 20,000,000 tons, and the average since 1924 has been about 16,000,000 tons. Most of this tonnage goes to Canada and only one fourth is distributed to other parts of the world. Brazil, Cuba and Italy represent the only other countries which use any appreciable quantities of American bituminous coal, and the demand from some of these markets is steadily shrinking. By and large, seaborne exports of bituminous are uncertain, fluctuating and speculative. Sales to Canada, on the other hand, are of long standing and have steadily remained around 13,000,000 tons.

Organized labor has played a most dramatic part in the history and growth of the industry. Bituminous mining has witnessed some of the most intense and spectacular struggles ever waged in America, and some of the coal fields have been the scene of actual civil war. Organization among the workers dates back to the

middle of the nineteenth century; the first national organization of any significance was formed in 1885. In the last quarter of the nineteenth century intermittent employment, low wage scales and unsatisfactory working conditions prevailed throughout the coal fields. This period was marked by the development of many new coal fields as well as by the expansion of railroad facilities, and markets which had previously been sectional were for the first time made available to producers from distant mining areas. Competition, already severe, was further intensified, and labor was made to bear the burden of falling prices by wage cuts. Labor conditions were further aggravated by conditions in the isolated mining towns, where compulsory purchases at company owned stores, the payment of wages in scrip and long hours gave occasion for justified dissatisfaction. Cases are on record, for example, of mining companies which offset part of their losses by profits made from the sale of necessities to the labor force at company stores. Others recouped their losses by short weighing the output of the miners, refusing to pay for certain work ancillary to the actual mining of coal and by abnormal deductions from miners' wages for coal which contained dirt and other impurities.

In 1897 the United Mine Workers of America, which has since come to be the dominant labor organization in the industry, called a strike in the eastern coal fields. While its membership did not exceed ten thousand, 150,000 miners in virtually all of the major fields laid down their tools and within a short time the greater part of the industry came to a standstill. From this strike there resulted an interstate joint conference of the miners and operators of the four main coal producing states, Illinois, Indiana, Ohio and western Pennsylvania, which are known as the Central Competitive Field. This joint conference fixed wage rates and working conditions for certain basic points in each of the four states. These were fixed with the purpose of protecting the competitive position of operators in each district. For specific mining sections within each district further adjustments were made in relation to the basic rates and working conditions, allowance being made for distance from markets, differences in geological conditions, quality of the coal and other factors which enter into the cost of mining and the competitive position of the operator in the market. Changes made in basic rates were also reflected in the rates paid in other organized mining districts

lying outside of the Central Competitive Field. Interstate joint conferences were held more or less regularly from 1898 to 1927, when the refusal of some of the former participants to negotiate a new agreement with the union led to the virtual abandonment of the Central Competitive Field as the basic unit of wage determination.

Since 1927 the effectiveness of the United Mine Workers of America has been steadily declining. The reasons lie in the existence of non-union fields centering in West Virginia, eastern Kentucky, Alabama, Tennessee and certain sections of Pennsylvania. Operators in these fields have consistently refused to become parties to a joint agreement with the union and have claimed that their natural competitive advantages would be lost through such action. They have sought with every device known to labor warfare to keep organized labor out of their domain and have been singularly successful. The absence of union interference has left the non-union operators free to fix for themselves the wage scale paid to their employees. Each mine makes its own wage scale and individual bargaining prevails. In many mines there are not even standard rates for a given class of work and each laborer makes his own bargain with his employer, the miner's wage being in large part determined by his bargaining ability.

The high quality of the coal in many of the non-union districts and the easier access to the coal seams has always given them an advantage over the union districts. The existence of uncontrolled wage determination gives them a further advantage, particularly in times of slack demand and limited employment, when by manipulating wage rates production costs can be adjusted to meet varying market conditions.

Unable to meet the competition of non-union mines a large number of operators in the organized fields have regularly and repeatedly demanded from the union a readjustment of their wage scales. The union, recognizing the futility of granting such concessions, since the non-union mines would still be free to cut their rates further in order to meet any such readjustment, has sought rather to force the non-union mines into the ranks of the organized. For thirty years it has centered its efforts on the organization of non-union fields, and the bulk of its funds, as much as \$3,128,924 in a single year (1921), has been spent for this purpose. Its efforts have been ineffective; the non-union operators have steadily increased their contribution to the country's production and have driven from many of the

important markets a large portion of the union mined coal.

In 1922 the organized operators attempted to force down the union wage scale. A four-month strike followed, which the miners won. Their victory, however, was Pyrrhic, for non-union tonnage continued to increase and as soon as an opportune moment arrived many operators abrogated their agreements with the mine workers' organization. A federal commission appointed in 1923 was unable, despite a most thorough and searching investigation, to make effective any of its recommendations for stabilizing the situation. As contracts with the union expired an increasingly large number of owners began to operate their properties under non-union conditions. The non-union portion of the country's output, which in 1922 approximated 30 percent, increased by 1925 to 60 percent and it is estimated that in 1930 it ran as high as 80 percent. In West Virginia, the most important of the non-organized sections, production grew from 108,000,000 tons in 1923 to 132,000,000 tons in 1928; in Kentucky from 45,000,000 to 63,000,000; while the total for Ohio, Illinois and Indiana, former strongholds of the United Mine Workers, has fallen from 146,000,000 to 87,000,000 tons, a decline of 40 percent.

The effects of this situation on the fortunes of the United Mine Workers of America is made readily apparent by the course of its membership. In March, 1923, it was the largest trade union in America, with a tax paying membership of 445,734, of whom about 380,000 were in the bituminous industry. By June, 1929, its ranks had been so decimated that there were approximately one third of this number on the tax paying roll of the organization. The end of the third decade found the union in a disorganized condition with important sections in revolt. Federal commissions and congressional investigations have proved futile in helping the situation. Without an attack upon the general organization of the industry and a radical change in the American attitude toward competition as a medium for bringing about stability in the bituminous industry, it is doubtful whether any attempt at solving the difficulty will be effective.

Although the importance of coal in the world economy has been in part diminished by the growing use of substitutes, it appears that for many generations at least coal will remain the primary source of industrial energy. Relative to

coal the supplies of oil and natural gas are being rapidly depleted, and there is a definite limit to the expansion of hydro-electricity. Despite the inroads of these substitutes the consumption of coal in absolute figures has continued to expand. In the shipping industry there is already evident a reversion from fuel oil to coal. Indeed, the net effect of substitute fuels appears to have been merely to check the rate of expansion in coal consumption.

Although the immediate effect of the new developments in the technology of fuel utilization has been to curtail the growth of coal consumption, these developments make it possible to anticipate a growth in the use of coal at a rate even greater than that which prevailed before the World War. Every day brings to light previously unknown wealth which has been hidden in coal. In the form of benzol coal already furnishes a significant portion of the fuel consumed in internal combustion engines, and successful laboratory tests lend credence to the idea that we shall some day lubricate the wheels of industry with oil made from the product of the mine.

In the meantime the pressing problem is one of bringing some sort of order into the world's coal industry. Europe has been searching for a means to this end. Since the crux of the difficulty lies in surplus capacity, the League of Nations and the International Labour Office have been seeking a way of adjusting output to demand. They have dismissed national measures as inadequate and the view has been officially expressed that without an international agreement between the producers concerning outputs, markets and prices, measures for equalizing wages, hours of labor and the abolition of artificial trade restrictions, as well as artificial stimuli to production, nothing will be accomplished. Thus far international agreements, particularly those affecting coal markets, have proved unattainable. They presuppose well coordinated national marketing systems, and such prevail in none of the more important producing countries except Germany. Without England as a party to an international agreement little of advantage can be expected; yet there is small evidence in Britain pointing even to the creation of a unified marketing system within its own borders. Nor do present evidences point to any probable reversal in national policies which have as their end the stimulation of industry within national frontiers. The desire to remain self-sufficient, particularly in the realm of fuel supply, for purposes of "national security" has proved and will probably

continue to prove a great obstacle in the way of an international agreement for restricting production. The memory of experiences during the recent war is still too vivid. For the immediate present, at least, the amelioration of conditions in the world coal industry by international agreement appears to be outside the realm of practical politics.

COALING STATIONS. See NAVY; SHIPPING.

COALITION. Apart from its meaning as a temporary alliance or as a combination of states for joint action the term coalition, as employed in a political sense, commonly denotes a co-operative arrangement under which distinct political parties, or at all events members of such parties, unite to form a government or ministry. Although it is derived from *coalescere*, to grow together, the word as actually used somewhat belies its nominal meaning; for the units or elements brought into combination by a coalition, very seldom grow together in any literal sense. The qualities of integration and permanence attach more frequently to a bloc than to a coalition, because the former is more like, and the latter to be based upon deep seated and enduring community of interest, as opposed to momentary convenience or necessity. Coalitions, however, are sometimes difficult to distinguish from blocs, and, moreover, they occasionally evolve into blocs.

Three familiar types of situation are mainly responsible for coalitions: the inability of any single party, where a multi-party system exists, to form a ministry commanding a working majority in the lower house of parliament; an even balance between parties under a bi-party system, leading one of the two to ally itself with any minor group or party strong enough to keep it in power; and a national crisis necessitating the suspension of party strife and the concentra-

tion of all forces in a common direction for the common safety.

The first type of situation is found most frequently in continental Europe. Russia and Italy are at present one-party countries, but elsewhere one meets a multiplicity of parties, ranging from six to seven in France and Germany to twenty or thirty in Czechoslovakia and some of the Balkan states. In all such countries every government is necessarily a coalition government. Sometimes the parties cooperating in support of the ministry are of the Left, sometimes of the Right; not infrequently they represent curious affiliations between groups of both Left and Right. Sometimes a coalition is based primarily on racial community, sometimes on religious alignments, sometimes on economic interest. It is often purely casual or accidental and rarely is it of long duration. On the other hand, it seldom happens that a coalition is swept from office integrally. As a rule, when dissension or ineptitude overwhelms it, its lines are merely reformed; certain parties hold on and others give way to newcomers, in a combination as tenuous, and often as illogical, as the one which it has superseded.

England is the classic land of bi-partyism, and it is there that coalitions under the second and third types of situation mentioned have been most conspicuous. At no time has the idea of coalition been popular among Englishmen, and at the present day no political term, perhaps, is in greater disfavor among them. Nevertheless, it was a coalition that drove Shelburne from office in 1783; George IV attempted to create one in 1827; Queen Victoria built up a short lived one in 1853; the Liberal Unionists were practically in coalition with the Conservatives from 1886 until, after a generation, they became merged with the larger party; in the years 1892-95 the Irish Nationalists were in league with the Liberals; and from 1905 until the World War, particularly after the elections of 1910, both Nationalists and Labour were aligned with the Liberals.

The most famous of all coalitions, however, and one that well exemplifies the third type of situation, was that organized in England during the war emergency. In May, 1915, the Liberal premier, Asquith, brought together in his reconstructed ministry representatives of all existing parties except the Irish Nationalists. Government on this basis encountered a considerable number of obstacles, and a political crisis of December, 1916, not only brought Lloyd George

to the premiership but resulted in a coalition "war cabinet" which for almost three years managed affairs essentially as a dictator. On the ground that it would be disastrous to handle the peace negotiations and the problems of reconstruction on a party basis, the coalition appealed to the electorate in 1918 and won a fresh lease of life. Englishmen, however, were of no mind to see it, or anything like it, continue indefinitely. In 1922 most of the Conservatives withdrew their support, as Labour and Independent Liberals had done previously, and thereupon straight party government was resumed. The political situations resulting from the elections of 1923 and 1929 raised the question of a Labour-Liberal coalition, but did not stir genuine favor for the plan in any quarter.

In multi-party countries coalitions are taken as a matter of course; in English speaking countries they are regarded at best as stop gaps or emergency measures. They have their uses, but certainly also their drawbacks. One of their effects is, naturally, to promote compromises in politics. Everybody must yield something, although mutual surrender is rarely sufficient to guarantee stability or strength for more than a fleeting interval. It is perhaps a not undesirable corollary of this quality in coalitions that they tend to curb radicalism and likewise to liberalize conservatism. Radical parties usually feel that they are expected to yield most, and they are usually least inclined to affiliate. Even where coalitions are a practical necessity they make for rapidity of political changes and shifts, tempered only by the already mentioned tendency of coalition ministries to renew themselves partially rather than integrally. Finally, and perhaps this is the most weighty objection, a coalition operates to release a government from the restraint and responsibility which, under a smoothly working bi-party system, a front opposition bench normally imposes.

COBB, FRANK IRVING (1869-1923), American journalist. After some years of newspaper work in Michigan Cobb became chief editorial writer, and later editor, of the *New York World*, where from 1904 until his death he exerted a strong influence upon the conduct of American politics. Although little known to the public he was in his own profession regarded as one of the ablest men of his day. As editor of the *World* he became the foremost journalistic champion of the "Independent Democrats"—a group not clearly definable which, although much more liberalized, succeeded the Cleveland following of an earlier day. This group, while clinging to the essential tenets of the Democratic party, rejected the rule of party regularity and held itself free to throw its influence to any political leader whose principles and record pointed toward good government. During the war period Cobb was the chief journalistic aid of President Wilson. He was absorbed in his profession and wrote very little for publication in periodicals other than the *World*. After his death a selection of his editorials and public addresses was compiled by J. L. Heaton and printed in *Cobb of "The World"* (New York 1924), from which an impression may be gained of one of the most forceful personalities of his time.

JOHN L. HEATON

COBBETT, WILLIAM (1763-1835), English journalist. Cobbett, who was the son of a small farmer, ran away from home to join the army. He was promoted rapidly but retired after a few years having meanwhile become discouraged by the abuses of army life. He attempted to expose the conditions he had observed but found that military corruption was so widespread that his charges were being distorted against him. Accordingly he fled to France and crossed thence to America. There he flung himself into the pamphlet war between Federals and Democrats and his powerful and brilliant pen was of great service to the former. He returned to England in 1800. At this time he was a Tory and a Jingo. In 1802 he founded the *Political Register*, the great weekly organ which he conducted until his death. The more he saw of politics at home the less he found that the pleasant picture of English

life he had formed in America corresponded to the facts. He soon became a radical criticizing abuses with a freedom that brought him into trouble, at one time even serving a sentence in jail for an article attacking the flogging of militiamen.

Cobbett's quick mind, his Berserker manners and his incisive pen made him a great force in public life; Hazlitt said of him that he formed a fourth estate of himself. He was a violent, overbearing man who quarreled with all the radical leaders in turn: Hunt, Burdett, O'Connell. He was a difficult colleague but excelled in the leadership of men in the mass, men who read his *Register* but never saw him; for it was the common virtues and common misfortunes of mankind that held his attention. He was a failure in Parliament, where he sat from 1832 to his death, but as a popular writer he was unequalled. His wit, his sarcasm, his graphic and pointed invective, his power of clever and sparkling analysis and ridicule made him an incomparable master of controversial prose. These gifts were used to the utmost against fund holders, money lenders, landlords and tithe holders: all the powerful classes to whose interests, he believed, the agricultural laborer had been sacrificed. For whatever the cause he was urging at the moment all his politics was governed ultimately by one desire. "I wish," he wrote, "to see the poor men of England what the poor men of England were when I was a boy." Most of the radicals looked forward; he looked back. He knew more about the agricultural laborer than anyone of his time. He had just the gifts—confidence, shrewdness and enterprise—which made many men of his class and type successful leaders in the industrial revolution, but he used those gifts as England's last peasant leader.

COBDEN, RICHARD (1804-65), British statesman and publicist. Cobden was the son of a Sussex farmer who lost his property in the crisis following the Napoleonic wars. He had a few years of wretchedly poor schooling and at fifteen

entered his uncle's business office in Manchester. He became a commercial traveler, established an independent business with two friends in 1828 and in 1831 opened a textile factory. His business success gave him leisure, which he devoted to study and systematic travel.

Before 1838 he had published several pamphlets on political and economic subjects and had been a candidate for Parliament. But it was the founding of the Anti-Corn-Law League in 1838 which gave him his opportunity in public affairs. The agitation for the repeal of the corn laws had a broader significance for Cobden than for most business and working men who favored repeal. To the manufacturers, repeal meant a better market for their goods; to the working men, deliverance from the semi-starvation of the "hungry forties." To Cobden it represented, in addition, the prelude to a new political method, which has received the name of "Cobdenism." Cobden repudiated the theory that trade follows the flag, arguing that international policy should aim at peace, since the real battle would, in any case, "be won by the cheapest." Hence Cobdenism was synonymous with the removal of all restrictions on trade, laissez faire in industry and non-intervention in the affairs of foreign countries.

Cobden entered Parliament in 1841 and immediately made his mark in the House. He won over Sir Robert Peel, who had been pledged to maintain the corn laws, and repeal was carried. This was the crowning triumph of Cobden's life. The consequent dissolution of the league dispersed the elements of the ad hoc alliance. The manufacturers, having got what they wanted, cared little for Cobden's pacifism, and his opposition to the Crimean War led to his defeat in the election of 1857. The working classes turned to other reforms, to which Cobden was hostile or indifferent. The evils of the factory system were as glaring as those caused by the bread tax and Cobden opposed the factory acts; the working engineers were just then laying the foundations of modern trade unionism, a movement which Cobden hated. Moreover, Cobden's policy of non-intervention conflicted with the desires of continental liberals, who received little encouragement from him, although the struggles of the oppressed nationalities for freedom were ultimately to draw Great Britain into the World War. Nevertheless, the failure of later Cobdenism was only relative. In 1860 Cobden succeeded in making a commercial treaty with Louis Napoleon which, apart from

marking a great step in the breaking down of age old Anglo-French enmity, became the model for many other commercial treaties and checked the tendency to increased tariffs that set in after the wars of the sixties and seventies. He resolutely opposed interference in Denmark, China and Mexico; and on the question of the Civil War, as on almost every other great political problem, he stood with John Bright as a steady supporter of the North and opponent of intervention.

COCCEJI, HEINRICH VON (1644-1719), German jurist. He succeeded Pufendorf at Heidelberg as professor of natural law and the law of nations. In his lectures on the philosophy of law he combated the ideas of Grotius and Pufendorf. He rejected the doctrine of sociality as the source of natural law, which, according to him, originated in the will of God and derived its binding character therefrom rather than from contract or a supreme principle of reason. His theory thus remained rationalistic in so far as he conceived this divine will to be known through reason rather than revelation. His references to the limitations of reason and his critical attacks upon the prevailing system of natural law paved the way for its ultimate subordination. But it was perhaps his greatest merit as a jurist that neither his inclination toward natural law nor his admiration of Roman law prevented him from founding the first independent system of German constitutional law in his *Juris publici prudentia* (Frankfort 1695). Like Conring he started from traditional German rather than Roman law and derived his principles of constitutional law from historical materials rather than reason.

COCCEJI, SAMUEL VON (1679-1755), German jurist. He was the third son of Heinrich von Cocceji and achieved high judicial and administrative office under Frederick the Great. In order to investigate existing abuses in the judicial system he made extensive journeys through

the Prussian provinces under the king's commission and succeeded in effecting far reaching reforms in the administration of justice. These were embodied in his *Projekt eines Codicis Fridericiani Pomeranici* (Stettin 1747) and his *Projekt des Codicis Fridericiani Marchici* (Berlin 1748). Coceji began also the preparation of a code of substantive law for the Prussian states upon the basis of natural law and the precepts of enlightened absolutism. But death interrupted his labors and the *Projekt des Corporis Juris Fridericiani* (Halle 1749) never went into effect. As a jurist Coceji was more completely than his father under the influence of Roman law, which he attempted to harmonize with natural law in his *Elementa jurisprudentiae naturalis et romanae* (Berlin 1740). His chief work as a scholar was the editing of his father's lectures, which he published with notes under the title *Grotius illustratus* (4 vols., Breslau 1744-52). The ideas of the elder Coceji on natural law are known chiefly in this form. Hence the names of both father and son are inseparably linked in the history of jurisprudence.

COCHIN, AUGUSTIN (1876-1916), French historian. Cochin, a member of a prosperous and distinguished Parisian family, led his class at the École des Chartes, immersed himself in the documentary study of the French Revolution and was ripe for productive greatness when he fell in battle in 1916. Yet in spite of the incompleteness of his work he must be given a place of importance in the historiography of the revolution. The *Crise de l'histoire révolutionnaire* (Paris 1909) reviewed in the work of Taine and Aulard the eternal contrast between the haters and the lovers of the revolution, and made one more appeal for objectivity in the historical treatment of this controversial subject. Here too is to be found Cochin's distinction between the plot theory and the circumstances theory, the two explanations of the Terror which he finds running through all histories of the revolu-

tion. The posthumous *Sociétés de pensée et la démocratie* (Paris 1921) and *Sociétés de pensée et la révolution en Bretagne* (2 vols., Paris 1925) show Cochin developing his own variant of the plot theory. The revolution was the work of a well organized minority, prepared during the latter part of the eighteenth century by the activities of various literary societies, agricultural societies, salons and other groups. Cochin made a careful study of the documents pertaining to the groups which existed in Brittany and concluded that they formed a genuine political machine of a kind familiar enough to Americans. Working with Charles Charpentier he collected vast stores of documents to show that the Terrorist government adopted policies which had been marked out and formulated by the political societies; one volume of these documents has been published as *Actes du gouvernement révolutionnaire* (Paris 1920). Cochin's work may be said to continue the tradition of Taine, but to have profited by modern historical method and training. It has exerted great influence on historians of the conservative side, but has scarcely lessened the gap—the true nature of which Cochin himself did so much to make clear—between such historians and orthodox republican historians of the official school.

XXXI (1926) 621-53; Lacombe, Bernard de, "Augustin Cochin, historien de la révolution" in *Correspondant*, vol. CCXVI (1929) 822-36.

CODE CIVIL is the title now applied to the instrument embodying the private substantive law of France, framed under the inspiration of Napoleon Bonaparte as first consul and formerly called the *Code Napoléon*. On August 12, 1800, Napoleon promulgated a decree appointing a code commission of four, consisting of Tronchet, president of the Court of Cassation; Malleville, a former judge of the court and a student of Roman law; Bigot de Préameneu, government commissioner of the court; and Portalis, government commissioner in the Prize Court, a Provençal of mediocre parts but philosophic in temperament and a moderate. There was, in fact, little that savored of republicanism in the commission.

The decree of appointment contained instructions to the commission to conclude its work in the ensuing November. While the period seemed absurdly brief, it appeared from what

followed that Napoleon really desired from the commission a draft which would afford a basis of discussion; for, upon receiving it, he caused it to be sent to the Court of Cassation and the Court of Appeal for study and comment. Then he sent it to the Council of State for consideration, first by its section on legislation and afterward by the general session of the council. In the discussions before the latter Napoleon took a direct and active part. He presided at many of the sessions and surprised his colleagues with his intimate knowledge of the technical subjects discussed and the freshness of his approach to them.

When the Council of State had at last approved the draft, it was referred to the Tribunal, where it was criticized as a "hasty" production but finally approved, and then to the National Legislature. Opposition there was eventually overcome and on March 21, 1804, the *Code civil* was promulgated.

Attempts at codification had often been made in France; as late as 1793 the Convention had appointed a committee headed by Cambacérès to report a draft within a month. Some have thought that the labors of this committee were utilized by Napoleon's commission. But the committee's product seems to have been too superficial to afford much assistance, and the real sources of the Napoleonic code lay farther back. Doubtless the *Institutes*, both of Gaius and of Justinian, afforded the model of the instrument; but most of the Roman law contained in it seems to have entered through French channels. There were the great commentators: Domat, whose *Lois civiles* had been published in 1694, and Pothier, whose *Traité des obligations* had appeared in 1761 and furnished, it is claimed, "three fourths of the Code"; while "entire chapters" were provided by the *Grandes ordonnances* framed by Chancellor D'Aguesseau before the middle of the eighteenth century.

But other sources can also be traced. In theory at least, Roman law prevailed only in that southern part of France known as *les pays du droit écrit*. Paris, where the code was drafted, was the center of *les pays du droit coutumier*, which furnished also most of the councilors of state. The *coutumes*, however, were no longer unwritten. Those of Paris had been reduced to writing before 1580 and the revised text of that year was used by the codifiers. Decisions of the *parlement* of Paris were also resorted to. Last in the enumeration of sources may be

cited the legislation of the revolutionary era, partly included in the *Bulletin des lois de la république française*.

In arrangement the *Code civil*, like Blackstone's treatise and those of other institutional writers, follows *pro tanto* the Gaian order. It is divided into three books which treat respectively of persons (civil status, absentees, marriage, divorce and separation, adoption, legitimation, *patria potestas*, guardianship, interdiction), property (ownership, usufruct and servitudes) and the acquisition of ownership (intestate succession, donations *inter vivos* and testaments, obligations, marital property, liens and mortgages, sequestration). Roman law is evident as a source, for example, in the classification of property and qualified interests and in the law of obligation; the influence of the *coutumes* in the provisions for intestate succession; the decisions of *parlements* in the provisions regulating the status of absentees; the republican legislation in the law of divorce and adoption, subjects on which the code made the earliest provision in modern western law; the law of testaments and the prohibition of entails derive from D'Aguesseau's *Ordonnances*. Although several of its articles deal with remedial adjective law, the instrument is for the most part what it purports to be—a code of private substantive law, the first of such codes unless we include Justinian's *Institutes*.

It will be seen that the *Code civil* contained little, if any, matter which was really original with its framers. What they did was to fuse the materials of the existing law into a new product in which the Roman contributions prevailed but with the Teutonic element not wholly wanting. Broadly speaking, it was the final step in the reception of Roman law in France. Like the contemporary French critics of the code, Savigny later criticized it as "the very hasty work of the known redactors," and such it no doubt was. If, as Amos contends, Napoleon's chief object was "political and legal unity," the special aim of the redactors was conciseness and simplicity. In many particulars of the code these results were attained at the cost of superficiality. Nevertheless, it appeared at the psychological moment when the Latin world, both European and American, had become painfully aware of the need of a restatement of its law. The *Code civil*, being the pioneer, was eagerly accepted as the model and became "to a great extent the code of all the Latin races." From its promulgation to the end of the century no

civil code was framed anywhere which it did not profoundly influence, and many of the later codes do little more than reproduce it. In France it has won popular devotion and has become a part of the legal consciousness of the people. While its outward integrity has been preserved, its content has been frequently and substantially modified by subsequent legislation.

CODE NAPOLÉON. See CODE CIVIL.

CODIFICATION. In its broadest sense, and as used by the historical school of jurists, codification means the reduction of law to written form. It presupposes the advancement of law through the preceding stages of legal history represented by *fas* (will of the gods), *mos* (customary law) and *jus* (judicial precedent), as well as the invention and diffusion of the art of graphic expression. Indeed Maine considers codification "a direct result" of the latter, although he recognizes as a contributing force the popular desire for accessibility of laws. But while codification in this sense is hardly distinguishable from other forms of legislation and marks the end of the purely customary stage of legal development, it does not attempt a complete displacement of custom by written law. In fact the earliest of the so-called codes are little more than partial expressions of long established custom. Thus in the Twelve Tables we find a provision (v, 6) recognizing the ancient *gens* and requiring succession by its members in default of agnates. This had long been the law, attained through a slow process of social evolution in the course of which the whole theory of succession had been revolutionized. In this particular the principle becomes fixed, further change is rendered difficult if not impossible and a new sanction is acquired—the will of the state expressed in written form. But

all the while the background of the principle—the nature of the *gens*, its composition and legal status—is left to customary law.

By far the most ancient as well as the most elaborate code of this type was that of Hammurabi, king of Babylon, promulgated about 2100 B.C. It was based upon the preceding customary law and treats quite fully, and often in a fairly modern way, of procedure, property and persons. Probably much influenced by it, although appearing some fourteen centuries later, was the Hebrew "Book of the Covenant" (now contained in *Exodus* xx, xxiii) followed, about a century after, by the "Book of the Law" (*Deuteronomy*, "second law"). These collections mark the progressive transition from Israel's purely customary law.

The classical example of such a code is the Roman Twelve Tables, which did not purport to embody the entire law and were most nearly complete in those subjects lying nearest the heart of the proletariat, such as debt, neighborhood regulations, procedure and funeral ceremonies. Nearly contemporary with the Roman code, although probably quite unconnected with it, was the collection known as the "Laws of Gortyn," recovered less than half a century ago and constituting the nearest approach to a code of early Hellenic law. Hindu law has always been to a great extent customary. Its leading repository, the so-called "Code of Manu" (*Manava Dharma Shastre*), is now believed to be of relatively late origin (400 A.D. by one writer) although containing material of great antiquity. This code, much of which treats of subjects other than law as now understood, was in force in Burma and Siam as well as India.

In China, too, customary law antedates the period of Hammurabi but written law seems likewise to have existed almost from the beginning. There were several early compilations but the most complete, and also the earliest which has come down to us, was the code of the T'ang dynasty, promulgated in 630 A.D. Some of its provisions, departing from the exclusively penal character of its predecessors, treat of marriage. Republished with certain modifications under the Ming dynasty it afforded the basis of the so-called "Manchu Code" (*Ta Ching Lü Li*) of the seventeenth century, which is, of all the Chinese codes, the one known best among foreigners by reason of its partial rendition into English by Sir George Staunton. It is still in force except so far as modified by recent Chinese legislation, including the penal

code and such portions of the new civil code as have been promulgated.

In its modern and restricted sense codification means much more than the mere reduction of law to written form; for that process has long since been accomplished in all but the most primitive societies. As mankind advances and laws multiply in number and complexity the need periodically arises for rewriting them with a view to greater accessibility and intelligibility. The earlier codes, being fragmentary, are in due course supplemented by legislation; but this likewise is usually of a piecemeal character and the written law leaves many gaps which must be closed, if at all, by resort to customary law or, what is practically the same, authoritative interpretation.

This may be illustrated from Roman law. The Twelve Tables announce (VIII, 5) the general doctrine of delictual liability, but without specifications. After more than a century and a half that meager provision was supplemented by a *plebiscitum* known as *Lex aquilia* which fixed as the measure of damages for the destruction or injury to property its value within a given period. But for injury the *lex* failed to prescribe the highest value and as late as the time of Gaius this was a disputed point, although some of the juriconsults interpreted the *lex* as necessarily meaning the highest. It also left unsettled many questions regarding parties and the circumstances under which liability might be enforced. The praetor sought to meet the situation by granting new remedies (*actiones utiles* or *in factum*) in addition to that provided by the *lex* and meanwhile the juriconsults were busy with interpretations, not always harmonious. Thus long before Justinian's time this particular branch of Roman law—typical of many others—had to be sought not only in the archaic Twelve Tables and the *Lex aquilia* but also in numerous and undigested praetorian *edicta* and still more numerous, and often conflicting, *responsa* of juriconsults. Justinian solved the difficulty by harmonizing, often through interpolations, this mass of material and incorporating it in one work—the *Digest*.

It was as the repository of such exhaustive consolidations of analogous matter that the *Digest* approached most nearly to a code in the modern sense. Yet it lacks the requisite of scientific arrangement in its larger outlines, not being limited to any one of the law's grand divisions. For while the *Digest* contains more

private, substantive law than any work of the *Corpus juris civilis* (q.v.) it includes much procedural, not a little public, and even some penal, law. Its predecessor in the *Corpus*, the *Institutes*, in this respect much more resembles a modern civil code, although too limited in scope. Of the others the *Codex* contains more criminal and ecclesiastical law than the *Digest*, but also a considerable amount of private, substantive law; while the *Novellae* deal with all sorts of subjects. Thus none of the Justinian books conforms entirely to the standards of today.

The first vernacular imitation of the *Corpus juris* on an extensive scale appeared in Spain about the middle of the thirteenth century. This was the famous *Siete partidas* of the learned Alfonso. As their title indicates they consist of seven books treating successively of canon law, public law, persons, obligations, property, procedure and maritime law. Although retaining their model's defects in form and arrangement the *Partidas* contain some original features, notably an abundance of legal forms, valuable even today. Through its extension to the Spanish colonies the work has played a part hardly inferior to the *Corpus juris* itself in extending the field of Roman law.

With the exception of Alfonso's code the influence of the Justinian books, which were promulgated in Constantinople, was naturally earliest in eastern Europe. It is noticeable in the *Liber statutorum civitatis Ragusii* (1272) and in the code of King Stephen Dushan of Serbia (1349), which incorporated a considerable amount of ecclesiastical and Byzantine law. "The Renewed Code of Ferdinand II" of Bohemia (1627) likewise embodied canonical doctrines as well as Roman law, but was framed under German rather than Byzantine influence. In Russia, however, the latter was paramount from the beginning. The *Ulozhenie* (Regulations) promulgated by Czar Alexis in 1649 drew from Justinian's *Novellae*, from the *Ecloga*, the *Procheiron* and other works of Basil the Great, as well as from previous Russian legislation, and contain constitutional law, judicial organization, procedure, contracts, property and penal law. However, the *Svod Zakonov* (Collection of laws) promoted by Speransky, the learned chancellor of Nicholas I, and framed by a commission selected in 1826, drew much from the *Code Napoléon*. A new penal code was promulgated in 1903 and the draft of a new civil code was placed before the Duma in 1907. Meanwhile the most purely Slavic code, framed by Pro-

essor Bogišić, had come into force in 1888 in Montenegro.

By decreeing the abolition of private property the Russian revolutionists of 1917 assumed that they would thus dispense with the need of either a civil code or a code of civil procedure; while the "people's courts" and other judicial functionaries of the new regime found themselves without a body of legislation to guide them and were obliged to rely on intermittent and unrelated decrees. By 1921 "a new economic policy" was announced, in which private property was recognized. Soon the preparation of a new civil code was undertaken and its drafting and adoption (1922) were carried through expeditiously. Except for its comparative brevity (it contains only 435 articles against 2281 in the *Code Napoléon*, 2385 in the German and 4063 in the Argentine) this code in the essentials of its form does not differ greatly from the others. But while the captions under which its material is classified—persons, property, obligations and inheritance—are reminiscent of its predecessor, their incorporation of the economic and social principles of the new regime give the code a distinctive character. Many subjects are treated in separate decrees. On January 1, 1927, a criminal code came into force, displacing that of 1922.

In northern Europe the earliest expressions of the code idea were in Scandinavia, where the simultaneous foundation in 1476 of the universities of Copenhagen and Uppsala seems to have stimulated the scientific study of law. After a series of commissions and no less than four revisions the *Danske Lov* was proclaimed by King Christian v of Denmark in 1683. It was pronounced by Bentham "the least incomplete of all the codes," although he found much omitted from its five books, which included (1) judicature (courts and procedure) (2) ecclesiastical regulations, (3) municipal affairs and domestic relations, (4) maritime law, (5) obligations, succession, property. Influenced by this code Sweden appointed a commission for codification in 1686 but it was nearly half a century before the final results were realized. The Swedish code of 1734 likewise contains five books, but their order and subject matter are considerably different from those of the Danish code, with which Bentham contrasts it unfavorably. The *Code Frédéric*, or Prussian *Gesetzbuch* of 1751 (later *Landrecht* of 1794), did not purport to be complete, although Savigny favored it more than the *Code civil*. A Sardinian code

was produced in 1770, which recognized Roman (which it calls "common") law as its foundation.

But the first instruments which really approximate the modern code requirements are the Napoleonic products of the early nineteenth century. The *Code civil* (*q.v.*), while containing some adjective law, is mainly confined to the private, substantive branch; but it does not exhaust the latter nor is its arrangement approved by the best legal experts of today. The other Napoleonic codes, however—the *Code de procédure civile* (1806), the *Code de commerce* (1807), the *Code d'instruction criminelle* (1808) and the *Code pénal* (1810) effect a delimitation of the fields outside the *Code civil* which has ever since been followed in civil law countries. Whatever criticism they have encountered has been not of their formal features as codes but of their alleged defects in substance. These Napoleonic codes have furnished the model for all subsequent codifications and were themselves the nucleus of a group in which they were reproduced with but few changes. The *Code civil* was adopted in the year of its promulgation in Belgium; in Haiti and Louisiana (largely) in 1825; in Bolivia in 1831; in the Netherlands in 1838; in Costa Rica in 1841 (now superseded); in Santo Domingo in 1845; in Rumania in 1864; in Italy in 1865; in Quebec in 1866; in Portugal and Venezuela (now superseded) in 1867; in St. Lucia in 1876; and in the Siamese draft code of 1908. These codes form a distinctively French group and, in spite of occasional modifications here and there, present a striking uniformity. Through their influence on the Chilean code of 1855 they furnished the model for that of Peru (1855); on this in turn were modeled the codes of Costa Rica (1856), Nicaragua (1871), Colombia (1873, still retained with modifications in the Panama Canal Zone), Guatemala (1877), El Salvador (1880) and Ecuador (1887). Apart from this Chilean group and approaching even more closely to the distinctively French group were the civil codes of Mexico (1870, since revised) and of Honduras (1880). In Argentina, thanks to her eminent jurist Sarsfield, an independent course was followed, resulting in 1869 in the most elaborate code of all, which was adopted in its entirety by Paraguay (1889) and influenced the code of Uruguay (1895). A Spanish group was initiated in 1889 by the *Código civil*, extended in the same year to Cuba, Porto Rico and the Philippines, in all of which it continues with

modifications, and was followed closely by the Panama code of 1922.

Distinct from all of these groups, especially as regards arrangement and certain underlying legal conceptions, is the *Gesetzbuch* (German civil code, *q.v.*). Promulgated in 1900 after more than a quarter of a century of continuous preparation, it embodies not only the acme of German juridical philosophy but the national aspiration for legal unity. This great work found a contemporary imitator in the civil code of Japan, was largely utilized by the framers of the Swiss codes (1912), adopted in its entirety by Turkey (1926) and is now being followed in completing the Chinese civil code. The latest among the epoch making codes is that of Brazil, promulgated in 1917 after eighteen years of endeavor. While utilizing German concepts and theories of arrangement it is yet a correct expression of Portuguese law as developed in Brazil.

No survey, however cursory, of modern codification would be complete without reference to the *Codex juris canonici*, which came into force throughout the Catholic world in 1917, marking the climax of nearly nineteen centuries of canonical evolution. It was completed by a commission working under the supervision of Cardinal Gasparri and consists of 2414 canons (corresponding to articles of secular codes) which are distributed among five books under the headings *Normae generales*, *De personis*, *De rebus*, *De processibus*, *De delictis et poenis*. A similar codex prepared for the churches of the Oriental Rite is now approaching completion by a commission of which Monsignor Dherbigny is president.

In England Bentham was the pioneer of codification. "His voluminous writing," says Amos, "had no purpose more distinct nor more recurrent than that." He was not a Romanist nor was he greatly influenced by the continental movement for codification already in full swing before his time. His work produced little apparent result during his long life, but within a generation after his death came evidences of his influence in the codes of India. The reaction of these on British home legislation is apparent in the judicial and procedural reforms of 1873, the Bills of Exchange Act of 1882, the Partnership Act of 1890, the Sales of Goods Act of 1893 and the Marine Insurance Act of 1906. Bentham also contributed to the movement for codifying American law, not only by his writings but also by forwarding to Congress his draft of a proposed code.

More effective, however, in American codification was the continental influence as manifested in Louisiana, whose law was codified early in the nineteenth century, and especially in the work of Edward Livingston. Another New York lawyer, David Dudley Field, inspired also by the continental movement, devoted much of his time after 1839 to the preparation and advocacy of codes of American law. His civil code was adopted in California and the Dakotas and in a modified form in Georgia. His procedural (civil and criminal) codes became the model for those now in force in about two thirds of the states, while many states have also penal (criminal) codes like his. New York state, however, for which all of the Field codes were primarily drafted, adopted only the procedural, and those in a modified form. The Federal Penal Code of 1910 is a late example of this class. In recent years the progressive element of the American bar has concentrated upon uniform legislation, and the conferences of state commissioners for that purpose, beginning in 1890, have resulted in the preparation and adoption throughout American territory of codified sections of the law on important commercial branches like negotiable instruments, bills of lading warehouse receipts. Since 1923 the American Law Institute has been at work on a restatement of important branches of the common law (contracts, agency, torts) and conflict of laws, which are expected to provide the bases for future codifications.

For half a century or more the codification movement has been tending to become international. The York-Antwerp Rules initiated by the International Law Association in 1877 may be taken as a beginning. The conferences called by the Netherlands government in 1893, 1894, 1900 and 1904 to consider plans for harmonizing the conflict of laws marked some progress, and committees of various organizations are now at work on drafts of special branches for a proposed code of international law. A conference has also met at The Hague for the codification of international law as to territorial waters, nationality and national responsibility for damage to aliens.

According to modern standards a code should have three characteristics differentiating it from ordinary legislation: completeness in containing all the law in force governing the subject of which it treats; logical, scientific and at the same time convenient arrangement; and, finally, clear and concise phraseology which avoids

prolixity on the one hand and ambiguity on the other. Thus, while the ancient codes treated of law indiscriminately, although never completely covering any branch, the modern ones purport to cover exhaustively each a special branch. The traditional ones are: civil code (private substantive law); code of commerce (mercantile transactions); penal code (crimes and punishments); code of criminal procedure; code of civil procedure; political code (public law). Some instances, indeed, indicate a tendency to carry subdivision even farther; thus in recent years we have the Indian Contract Act and the Swiss Code of Obligations, the Montenegrin Code of Property and the Indian Evidence Act, while the English speaking nations have nearly all codified their law of negotiable instruments. Definitions and rules for interpretation are no longer considered essential or even desirable features. While the above requisites have operated as ideals in modern codification it is quite generally recognized that they have rarely if ever been attained in any single instrument. "Of all the codes which legislators have considered as complete," said Bentham, "there is not one which is so." It is worthy of note that although the nature of codification is such as to discourage innovation in form, new schemes of arrangement within the particular codes have appeared in the German, Swiss and Brazilian instruments.

"A code," said Austin, "must be the product of many minds." As a rule the great codes, ancient and modern, have been framed by commissions which functioned by a division of labor. Thus, traditionally at least, the Twelve Tables were drawn up by decemvirs, although there are no details as to how the work was done. Tribonian and his associates in preparing Justinian's *Digest* are believed to have distributed their material in three parts, each assigned to a special group of the commission; the first taking institutional or special works, the second, commentators on the praetor's edict and the third, miscellaneous treatises. Meeting in plenary session the commission would call for all material collected by any group or member on the topic under discussion, the most suitable being utilized and the remainder discarded. In the Napoleonic codification selection of personnel played an important part, and while Savigny severely criticizes the attainments of the commissioners they were probably the best available at the time and were certainly calculated to reflect all elements and phases of the

old law. The regional principle was employed when the Spanish codifiers were appointed under the royal decree of 1880 providing for a general codification on the basis of the 1851 draft.

Amos, writing nearly sixty years ago, proposed as the successive processes for codifying the laws of England: a commission of three to devise the plan and arrangement, "inviting advice from all quarters"; two assistant commissioners, at least one of whom should be "a barrister in large practice," to draft the text for each grand subdivision, reporting periodically at brief intervals to a commissioner; and finally, submission of drafts to "the very highest legal ability in the country." Very similar to this is the plan of the American Law Institute where each of the main branches chosen for restatement was assigned to a "reporter," supposedly a specialist in that line, with whom later cooperated a group of "advisers," meeting periodically and submitting their drafts to the assembled institute at its annual meeting. The National Conference of Commissioners on Uniform Laws follows a somewhat similar plan. Probably the most extensive use of experts and specialists was in preparing the *Gesetzbuch*. Here we find such names as those of Ihering, "greatest Romanist of our day," Windscheid, Sohm and others of world wide fame. The drafts were submitted to judges and university professors, as well as to commercial bodies, and all were invited to express their views. Munroe Smith declared that "the kind and grade of capacity demanded are higher in the case of the codifiers than in that of the ordinary legislator or judge," and that "the variation from the ideal is greatest in our codifiers." Too often, especially in the United States, have such commissions been overloaded with mere politicians. Amos points out with telling effect the New York codifiers' palpable ignorance of Justinian, to whom they so glibly referred and whose *regulae juris* they attempted to incorporate in their own production. Its ill digested and unscientific character probably had quite as much effect as did hostility to codification per se in finally frustrating David Dudley Field's great project.

Codification by commissions has not been the exclusive method. Notable instances are found, both in ancient and modern times, of codes which were largely, and even entirely, the work of a single individual. Such appears to have been the case with Solon's legislation, with the Montenegrin code of Bogišić, not to mention

Bentham's or the so-called code of Nathaniel Ward of Ipswich. To a great extent Sarsfield was the author of the Argentine civil code and Bevilacqua of the Brazilian.

A priori there would seem to be little room for difference of opinion as to the desirability of so expressing the law in written form as to render it complete, logically arranged, concise and clear. Those are desirable features in presenting formally any body of information. The continental opponents of codification have not usually assailed it in the abstract. Their objections have generally been directed to a particular code, to special features or methods of codification or, as in the case of Savigny, to the time of the undertaking. Although Savigny readily found particular deficiencies in the *Code civil* his essential objection was that the state of French jurisprudence at that time precluded the possibility of producing a truly scientific code. He failed to foresee that codification would bring relief from legal chaos in France, afford a basis for general improvement in the substance of the law and result in the initiation of a world wide movement looking toward restatement and reform.

The truth was that the epoch in question offered conditions which proved highly favorable to codification. With the overthrow of the old regime there arose popular desire for new institutions throughout the social structure. Moreover, power was concentrated in one who sensed the possibilities, political and social as well as legal, of codification. Even before Napoleon's rise to power there had been a republican demand in the Assembly for a code which had resulted in the appointment of a committee functioning under Cambacérès. The failure of this committee to produce anything worth while illustrates the difficulties of codification by means of the democratic process. In such an instrument as a code of law so many interests are affected and so many differences of opinion arise that unless authority exists to overcome them the effort, however well supported by popular sentiment, is apt to fail because of a deadlock.

A circumstance especially favorable to codification is the existence of a nationalistic sentiment in its formative state. It is doubtful, for example, whether the Constitution of the United States, which in a limited sense is a code of public law, could have been adopted much earlier or later than it was. Nationalistic sentiment is in turn promoted by codification. Ham-

murabi was clearly aided by his code in consolidating his realm; Frederick the Great and Napoleon planned their codes, primarily with that end in view. Victor Emmanuel frankly declared that the Italian civil code, which was largely an imitation of a foreign instrument, was "one of the chief factors of national unity." The effect of the *Gesetzbuch*, although then less than a score of years old, in holding Germany intact during the perilous aftermath of the World War can scarcely be estimated. Even the Turks, although unprepared as yet to frame codes of their own, have recognized their importance in promoting national unity and borrowed from Switzerland and elsewhere instruments to terminate the divisive operation of separate legal systems for the various religious communities. The importation of the Swiss code was all the more significant because this code was itself the product of a national movement for legal unity beginning when every Swiss canton had a separate legal system.

In English speaking countries a stock objection to codification has been its crystallizing effect. It is argued that codification displaces that "delicate elasticity" of English law which is "just sufficient to admit of its reaching the most minute modification in a new state of facts without involving any perilous amount of vacillation." This is a legitimate argument against premature codification but it is hardly one against all codification. Premising a certain sequence of legal development it would follow, in this aspect, that the most favorable time to codify a legal system is when it has reached a static, or at least advanced, stage of development, such as that of the Roman law in Justinian's age. Chalmers, the English jurist, criticized the French *Code de commerce* because it was based on the sixteenth century ordinances of Colbert, and French commercial law's "development was thus arrested and it remains in substance what it was 200 years ago." The defect in that instance, however, was not inherent in codification, being partly due to the selection of an antiquated source.

To Munroe Smith, who followed a via media between its extreme opponents and champions, codification involved "the transfer from the courts to the legislature of the future development of all our law; the elimination, as far as may be, of the judiciary as a factor in the making of our law." Such a change he considered undesirable as to that portion of private law intended "primarily to secure the advantage of individ-

uals." He deprecated the use of the term "elasticity" in connection with the common law and declared that "ease of amendment . . . is the chief advantage of judicial legislation," i.e. of "common" over codified law. The former "may be amended by decision. When a case arises which shows that an existing rule of common law was originally ill formulated, or has ceased to express the existing sense of justice, it is in the power of the courts to amend the rule." But, as Sir James F. Stephen long before pointed out, one might need to wait a century or more before "a case arises" which involves the precise point in question. Smith also deplored the diversifying effect of separate codification by each American state and the consequent interruption of that steady nationalization of American law which he viewed as taking place by judicial interpretation, especially on the part of the federal tribunals.

There is little doubt that some branches of law lend themselves more readily than others to codification. The rules determining the consequences of negligence and fraud, for example, may be stated in general terms; but the applications of them are too multifarious to foresee and no codifier has done much more than to fix the standards of conduct. The English law of real property would be harder to codify than the law of negotiable instruments has been; but the prior selection of the latter was due not to any apparent simplicity but to the demands of the commercial rather than the professional classes for its uniformity as well as restatement. In the last analysis any branch of law worthy of the name must be reducible to principles and these are necessarily capable of classification and expression in written or code form. To the objection that "the common law can not be crystallized into forms of words and . . . rules" Munroe Smith well rejoined that it "is not only possible but is in fact precisely what the English and American courts have been doing ever since they began to decide cases."

In modern times there has long been an undercurrent of opposition to the idea of codification. While the code idea has advanced despite this sentiment, practical experience with codification has tended to dispel certain popular illusions as to its merits. The first is that of permanence. Various codifiers have said, and doubtless many more have felt, that their work at least would endure for all time. But such a result is impossible. For codification, like archi-

tecture, is at best only a transitory process. The period of transition to a new code may, indeed, be much longer where the work is well done; but the end must come, and usually much sooner than the authors anticipate. The *Corpus juris* had been in force less than two centuries when a successor of Justinian found it necessary, or at least advantageous, to promulgate the *Ecloga*. A shorter period elapsed before the ponderous *Basilika* appeared to supplant both of its predecessors, but it was destined in its turn to give way after some five centuries to the briefer *Hexabiblos*. Most restatements have been far less enduring and while none of the modern codes has been subjected to such an acid test of time many have already been superseded in whole or in part. As the conditions of society change new legislation is required, old problems lose their importance and codes become obsolete, even without formal repeal, by slow attrition on the one hand and slow accretion of new laws on the other.

Another illusion regarding codes is that of the possibility of attaining complete simplicity. Frederick the Great hoped that his code would prove to be so simple that "the whole body of modern advocates will be rendered useless." So the French republicans, according to Barrère, aimed "to make the law simple, democratic, and accessible to every citizen." But this was only another chimera. Clearness we have seen to be one of the requisites of a true code; but that does not mean that it must be equally clear to all minds—to the peasant as well as to the philosopher. Law, like other branches of knowledge, has its terminology and its network of concepts, accumulated through many centuries and often passed on from one civilization to another, as is evidenced by the Roman legal terms in English. Even the Constitution of the United States uses terms like bill of attainder and habeas corpus, which have not only a technical meaning but a long legal background. The technical language should of course be clear to those whose task it is to apply the code, but to go further and attempt to bring the language within the comprehension of the masses is to invite uncertainty and thus defeat one of the prime purposes of a code.

Frederick likewise at first "prohibited all interpretation and ordered that recourse should be had to the legislative power." In this he was but following Justinian and anticipating Napoleon, both of whom forbade commentaries—the normal civil law method of interpretation. But

Frederick was compelled later to withdraw his prohibition, while those of Justinian and Napoleon were ignored. For interpretation arises in response to the need of determining authoritatively whether a particular case falls within that provision of a code which is alleged to govern it. Unless the question can be so determined the case can never be decided and the code fails of its purpose. No codifier, however experienced, can foresee more than a fraction of the myriad questions which may arise under any provision he may frame. On the other hand it cannot be gainsaid that most modern codes anticipate and provide for a greater number of contingencies and future cases than does any consuetudinary system. Codification, then, does not dispense with interpretation but does reduce the need for it. As Sir James F. Stephen remarked, a code may relieve the uncertainty of waiting a century or more for some one to bring a lawsuit in which your question may be decided. Nor is interpretation inimical to codification. Any legal instrument is the richer for being subjected to the scrutiny and construction of experienced jurists applying it to concrete cases. Bryce was not far wrong in attributing to the judicial interpretation of the Constitution of the United States an importance not inferior to the original text. Thus interpretation is at once the normal complement of codification and the measure of its usefulness.

As a corollary from the foregoing is the illusion held by certain of the early advocates of codification that a proper code would make the law so plain as to render resort to the courts unnecessary. That involved, among others, the assumption that litigation results mainly from the law's uncertainty. Of litigation so caused there should be, and probably (for no exact statistics are available) is, less, proportionately, on matters controlled by a code. But experience has demonstrated that litigation continues even though the law itself is clear, increasing with the growth of population, the expansion of trade and industry and the growing complexity of society. But except for the fact that a new and innovating code sometimes requires frequent preliminary interpretation there is nothing to support the countercharge that such increase results from codification. In fine, while codification is intended to introduce further stability, certainty and rationality into the law it is not a prelude to the millennium.

CODRINGTON, ROBERT HENRY (1830-1922), English anthropologist. Codrington's study of primitive life during his thirty years of missionary service in the Melanesian Islands resulted in contributions to anthropology which are best represented by two important works, *The Melanesian Languages* (Oxford 1885) and *The Melanesians* (Oxford 1891). He belongs to that select body of field workers in anthropology who have approached their task with adequate realization of the barriers separating the savage from the civilized mind. Supremely aware that he possessed his "full share" of the "prejudices and predilections" common to missionaries he managed to achieve objectivity by aiming consistently to "set forth as much as possible what natives say about themselves, not what Europeans say about them." With his knowledge of the Melanesian tongues Codrington was able to gather from the spontaneous utterances of the more intelligent natives at least the general import of their beliefs; and very few interpreters of primitive religions have achieved even this de-

gree of success. His famous generalization that "the Melanesian mind is entirely possessed by the belief in a supernatural power or influence called almost universally *mana*" rests in the bed rock of native evidence thoroughly sifted and attested. In stating this principle Codrington confined himself strictly to the facts as found in Melanesia, making no assumption, as later students of the magico-religious have done, that it is of world wide application. Others tend to assume that the mana principle (or "dynamism," as Van Gennep would say) has a validity apart from and in contrast to that of animism; but Codrington faithfully reports that in the Melanesian region the doctrine of mana and the belief in spirits overlap in manifold ways. The widespread speculative and controversial treatment of mana at least illustrates the immense impetus given to science by conscientious and penetrating ethnographic research such as Codrington's.

R. R. MARETT

COEDUCATION. The term "coeducation" is commonly understood to mean the education of both sexes in the same institution and in the same classes; it has also been applied to education of men and women in the same university but in separate classes or in affiliated colleges.

Real coeducation is a modern phenomenon. In ancient Greece the sharp separation of the sexes in social and economic life had its reflection in the educational system. Greek women received only a slight literary education and coeducation was unknown. Although the status of women in Rome was distinctly higher than in Greece education of boys was separate from that of girls save in their early years, when plebeian girls were permitted to attend the *ludi*, or elementary schools, in the forum. From the dawn of the Middle Ages until late in the eighteenth century social usage and ideas sharply separated the functions of the sexes, relegating to women housewifely tasks and the rearing of children, and to men all other social, economic, political and intellectual functions. Under such a regime coeducation could not exist.

The late eighteenth and early nineteenth centuries saw the beginnings of coeducation. Pestalozzi, the Swiss educational reformer, taught boys and girls together in his famous elementary school at Burgdorf, which was visited by educators from many countries. Coeducational schools were established by the Society of Friends in several American states after the revolution. Naturally the growth of co-

education could not come about until the desirability of opening educational opportunities to women had been recognized.

The most powerful influence in furthering the view that girls should be given schooling comparable to that of boys was the industrial revolution, which profoundly altered the lives and the status of women. Scores of thousands of women by working exhausting hours in factories demonstrated that women could achieve economic independence. Little by little this fact was recognized not only by public opinion but by law, one civilized state after another acknowledging the rising status of women by revising in the direction of independence for wives legal codes which had so long borne hardly upon women.

As a further consequence of the economic revolution women of the middle classes, who for centuries had been chained to the spinning wheel and the loom, now enjoyed considerable leisure with a resulting demand for increased educational opportunities.

These developments, in a milieu pervaded by a democratic ideology assuming equality of opportunity for all and state responsibility for the education of the nation's children, combined to pave the way for the growth of coeducation. The discovery that segregated schools were more expensive also aided the spread of coeducation.

These factors have operated more potently in America than in Europe, where ancient traditions of segregation have proved a greater obstacle to coeducation. In Catholic countries the power of the church has been consistently exercised against coeducation, at least in any school above the elementary. In general, equality of educational opportunity has been interpreted in European countries as signifying nothing more than the opportunity for girls to study much the same subjects as boys, with much the same methods of instruction; nor has the feminist movement exerted any significant influence in changing this situation except in the realm of higher education, being apparently content on the whole to accept segregation of boys and girls in secondary schools so long as these institutions afforded to girls approximately equal opportunity to secure preparation for the university or for a vocation. True, in cities or small towns, where no special secondary school for girls exists, it is not uncommon for girls to be admitted to the boys' school. But coeducation under these circumstances has been described as a last resort (*pis aller*), adopted only for economic reasons.

Elementary coeducation is general only in Holland, Switzerland, Jugoslavia and Greece, although it is by no means uncommon in Great Britain.

Answers to a questionnaire circulated extensively among European teachers of secondary schools in 1929 revealed that a large majority of countries provided segregated secondary schools but tended to make programs and methods identical save for gymnastics and manual work. Although boys and girls in France are instructed in separate *lycées* or *collèges* the programs of study leading to the *baccalauréat* have been since October, 1924, practically identical. In England and Wales the public schools controlled by the Board of Education and receiving state subsidies are preponderantly of the segregated type. In the Irish Free State, Belgium, Germany, Austria, Hungary, Spain, Italy and Greece coeducation is not favored in secondary schools.

On the other hand, a few countries have been trying out coeducation with more or less satisfactory results. An interesting type of secondary school has recently appeared in Hamburg, Bremen and a few other German cities. These so-called "community schools" (*Gemeinschaftsschulen*) are frankly experimental in character and have introduced the innovation of coeducation as a part of a calculated policy of minimizing sex distinctions in response to changed social conditions. In Poland, in 1929, 26.7 percent of the total public and private secondary schools were mixed. Holland, Jugoslavia and Russia are the only European countries in which the majority of secondary schools are coeducational. In Holland there are no secondary schools solely for boys and only one fifteenth of the total secondary schools are reserved for girls. Jugoslavia reported in 1928-29 that 75 percent of her public secondary schools were mixed. Soviet Russia has adopted a deliberate policy of coeducation from the elementary school through the university. When the historical status of women in Moslem countries is considered it is significant that Turkey recently became interested in coeducation and in 1927 tried the system in several middle schools. European universities are almost without exception open to qualified women, who have flocked to them in ever swelling numbers since the World War.

The history of coeducation in the United States presents a sharp antithesis to that in Europe. Murray's *New English Dictionary* and the *Standard Dictionary* state that the term

"coeducation" originated in the United States. In the colonial era girls were generally excluded from the boys' schools with the exception of the dame schools and the elementary schools in Dutch New Netherlands. But after the revolution the elementary and secondary schools of the new states were gradually opened to girls. Most of the early high schools dating from the eighteen twenties and thirties were boys' schools. Coeducation was forced to wait until public opinion had been converted to a belief in secondary education for girls. This belief spread rapidly after 1850 and the tendency toward coeducation in public high schools became increasingly powerful. In 1926 out of an estimated number of public secondary schools of 22,500, only 102 of the segregated type were reported, most of these being established in old eastern cities. On the other hand, many such private schools and academies exist in the United States. In 1928, 74,954 boys and 78,775 girls were enrolled in segregated private secondary schools, while 115,520 were receiving instruction in coeducational private schools. Colleges and universities have not so wholeheartedly accepted coeducation as have the public high schools. Not only are certain endowed universities, such as Harvard, Yale and Princeton, all but closed to women, but the state universities of Virginia and North Carolina admit women only under restrictive conditions. One compromise in the struggle arising out of proposals to open American universities to women has been the co-ordinate college, such as Barnard and Radcliffe at Columbia and Harvard respectively, where women are offered substantially the same curriculum as in the men's division and under the same general auspices. Approximately 100 separate colleges, exclusive of junior colleges, have been established for women, with an enrollment of 41,180 in 1925-26. Most of these colleges are located in eastern, southern and central states.

Economy has been a cogent reason for the adoption of coeducation in the United States. The leaders of the free school movement were not slow to see that the same standard of excellence in grading, instruction and equipment could not be maintained in segregated schools without a much larger teaching force than would be required in coeducational schools. Democratic theories have also played their part in the outcome. A Bureau of Education *Circular* (no. 2, Washington 1883) summarized reasons for adopting coeducation sent in by more than 500

cities. Several cities gave as their motive "justice to both sexes"; 14 declared the system to be more "impartial"; 158 declared it to be "beneficial" to both sexes; 101 favored it as "economical," 81 as "customary," 78 as "convenient" and 59 as "natural." In 1902 an educator explained the prevalence of coeducation in the West as follows: "The necessities of frontier conditions and the influences of education by the state paved the way for educating them [both sexes] together."

When American women had achieved a measure of economic and legal independence in the sixties and seventies they worked individually and collectively to extend the opportunities for higher education to their own sex. Unquestionably feminist influence has been powerful in America, both in bringing about coeducation in state universities and in securing the foundation of separate and affiliated colleges for women.

Somewhat of a reaction against coeducation set in about the opening of the twentieth century and various difficulties were brought to light by critics of the system. It was asserted, and still is in some quarters, that women need a course of study and methods of instruction that take more account of their peculiar psychological nature and needs and of the special social demands that will be made upon them. Critics have also cited as arguments against coeducation: the moral problems created by the free association of girls and boys in high school during the unsettled period of early adolescence; the election by college women of the humanistic subjects in such numbers as to drive the men from those courses on the ground that they are "feminine stuff," thus depriving men of the liberal culture they greatly need; the difficulties created for deans of women and deans of men in coeducational universities by the round of social activities participated in by men and women who are so absorbed in the opposite sex that they develop no serious interest and purpose in study; the more rapid mental development of girls after the twelfth year, often resulting in superior class work on the part of the girls and discouragement of the boys; competition with boys and men in meeting the exacting intellectual standards of high school and college, which is injurious to the health of young women. Of these last two contradictory criticisms the latter has been so abundantly refuted by investigation that it is rarely heard at present.

On the other hand, the advocates of coeduca-

tion point out that: the whole trend of modern social and economic life is in the direction of a closer approximation of the interests, activities and life work of men and women and requires similar education; if men and women are to work and play together and to strive for common ends they should learn to understand and appreciate each other by being educated together; there is considerable testimony of educators to the effect that except in occasional instances the daily association of adolescent boys and girls has, instead of affecting morals adversely, lifted the moral tone of coeducational schools above that of segregated institutions; men and women educated in common run together better "in the harness of married life"; the rich and varied offerings of our coeducational high schools and colleges make it possible for each sex to choose those courses which best meet individual tastes, talents and life purposes; if men are driven from the humanistic courses by the presence of women in the classes the solution of the difficulty would seem to lie, not in banishing women, but in educating young men to accept association with women in college, as in life, as a matter of course.

In recent years there appears to be a trend in American education toward differentiating the education of men and women in the secondary and collegiate stages. Increased stress on home economics courses in high schools, courses in eugenics at Vassar which include study of the physical and mental development of the child, and the Institute for Coordination of Women's Interests at Smith are indicative of this tendency. Whether these specialized courses will be widely elected by women cannot yet be determined, but their development in coeducational institutions may well dissipate many objections to coeducation founded on the view that women have special interests and needs that demand special educational treatment, without abandoning such advantages as coeducation provides.

COEN, JAN PIETERSZON (1587-1629), founder of Dutch power in the East Indies. As a young man Coen studied commerce, especially in Italy, and in 1607 he entered the service of the East India Company. In 1613 he became director general of the Dutch factories in the East Indies; from 1619 to 1623 and from 1627 until his death he was governor general in active service.

Coen, like the Portuguese Albuquerque, definitely fixed the direction of his country's colonial expansion. The Dutch East India Company from its founding in 1602 until Coen's assumption of supreme power had merely maintained a few small factories in the Malay Archipelago, the governors general traveling from one to another with the fleet which gathered the spice crop. Coen realized the utility of establishing strong settlements and a real central base. In 1619 he founded Batavia, which he made the seat of administration, and subsequently strengthened the position of the company in Java and the Spice Islands by the foundation of military posts. His task was made difficult by the presence of the competing English, whom he could not fight openly because of the alliance between the United Provinces and England. Coen did succeed in making their existence difficult, however; he was morally responsible for the massacre of Amboina in February, 1623, when twelve Englishmen (according to some authorities, nine) were condemned to death by the head of the Dutch factory. Coen was so hated by the English that in 1624 they caused the Estates General to forbid him to return to the Indies, and he was able to rejoin his post only by making use of a subter-

fuge. On his arrival in Batavia the English left the city and Dutch superiority in the East Indies was definitely assured.

Toward the natives Coen was strict and even cruel, his conduct being the almost inevitable consequence of company orders to establish commercial monopoly. His importance as an early colonial leader has only recently been recognized.

COERCION as a trait of human behavior may be said to obtain wherever action or thought by one individual or group is compelled or restrained by another. To coerce is to exercise some form of physical or moral compulsion. Among human beings the nature and significance of coercion may be specified in terms of: the prior relations of the coercer and the coerced; the specific forms which the act of compulsion takes; and the act's total consequences during a certain period of time. A coercionless society is inconceivable. Coercion takes place whenever two or more living organisms different from one another live together.

Their compulsions and restraints may be direct or indirect. The indirect make up much of what is called the social order, but the sense of direct coercion always imminent is no small component in their sanction. It is the force in conscience and underlies much that is normal as well as neurotic in human behavior. Neurotics suffer from repressions in which the repressing agent is a desire or an attitude—called by psychoanalysts "censor"—set up and sustained by the ineffable mores of the community in which the sufferer grows up. Operating automatically with unchallenged authority the mores establish as habitual the conflict in an individual's life wherein his neurosis consists. If it is not recognized as the consequence of coercion by society it is because the coercion is reflex and automatic, incorporated, so to speak, in the personality of the coerced.

Where a coercion is not so incorporated it is recognized and is called coercion. When it is

direct we call it physical; when indirect, moral. Both compel or restrain conduct by *force majeure*. The force lays down the performance gradients along which the action unwillingly takes place.

Whether such coerced action is sanctioned depends upon the prior relations of the protagonists. Where these are not implied by the institutional structure of society, but are chanceful or episodic, the coercee committing, say, robbery or murder under the threat of death, is not held responsible. But where the protagonists are related as parent and child, master and servant, principal and agent, the coercee is held responsible. It would seem that the relations of coercer and coercee are regarded as not extensible from sanctioned to disapproved coercions. Sanctioned coercions are identifiable through the fact that they evoke conformity (*q.v.*). Under sanction, coercer and coercee are presumed to be members of each other on the analogy of parent and child in the family. The coercive intent is generally acknowledged as good, in itself or by its consequences, for both protagonists. It is this sentiment which sustains the legal system, taxation, compulsory education, established religion, the forms of manners and morals current and all those modes of coercion which are used in times of national crisis, such as war, pestilence or famine. The presumption is that security and other advantages accrue to the coercee—in the case of punishment for crime, security from subsequent coercion. This presumption both rationalizes and sustains what is in the end the brute, irrational superior force, actual or fancied, on which coercion depends.

It is customary to assume that sanctioned and unsanctioned coercions differ in kind. No such difference appears on analysis. An unsanctioned coercion is one operated by an outsider. The outsider is such only because he does not belong, according to custom or law, to the "duly constituted authority" in a given field. He has no "sovereignty," he is an interloper. According to the scale and range of his operations he may be anything from a highwayman to a Bonaparte, a cipher in a lynching mob to a volunteer crime commission or vigilance committee. The higher his scale and the wider his scope the more likely are his coercions to acquire those sanctions which convert unwilling deeds into willed duties and shift the emphasis from the coercer to the coercee, from coercion to conformity. Sanctions accrue to an act by an initial conformity with

the mores through the repetition of long established usage and through assumed satisfactory consequences to the community as a whole. Usage has sanctioned the boss system in American politics; reccency keeps its equivalent in other fields, known as "racketeering," an unlawful form of coercion. Lynching, although a statutory crime, is so congruous with the southern mores that it goes practically unpunished there. For the same reason the Eighteenth Amendment can be enforced hardly anywhere in the United States. On the other hand, because of the satisfactory consequences presumed to accrue from them, compulsory education and the income tax meet with conformity close to free consent. The sanctions described establish the only discernible differences between blackmail and taxation, between graft and tribute or "reparations," between conscription and forced membership in labor unions and trade associations or churches.

Most social coercion is indirect; it only threatens force. Its statutory formula is, "under the penalty of the law." But all coercions involve fear of penalties. Without belief that the coercer can and will impose penalties no indirect coercion can be effective. Authority, which is the sanctioned exercise of indirect coercion, rests upon and is nourished through this belief. The coercer is credited with the power to impose feared penalties and his authority holds only so long as his credit is good. The credit may accrue to him variously: through once making his authentic force directly felt (as does a highwayman or a successful pugilist); by delegation from another (a notion which is a component in all views of the source of authority—such as theories of divine right, natural right, legal right—since they all refer back to an ultimately supernatural original source); by chance or coincidence leading to a delusory belief that the coercer actually possesses delegated power.

It may be doubted whether these modes of establishing credit for coercive strength could long sustain it except for the lengthy period of direct coercion and authority practised by adults upon the young. The prolonged human infancy carries with it prolonged subordination and dependence of the young upon the old. This creates in each new generation a habit of submission and obedience and at the same time a belief in the strength of the old which long outlives this strength. Thus authority, as *patria potestas*, survives the power to enforce it; it lives on the mores into which it has become incorpo-

rated and they sustain it arbitrarily. With the growth of society, the division of labor and the specialization of functions the scope of the habit of submission spreads from parent to school, church, state and to all the other institutional forms and persons that serve as emotional surrogates for the *patria potestas*. Surrogates must either harmonize with a community's mores or be able to destroy them. The latter is possible only to radical alterations of the conditions of social life, like machine industry. Hence dictatorships, even of revolutionary origin like Napoleon's or Mussolini's, and civil disobedience like Gandhi's, can flourish, while "dictatorship of the proletariat" makes industrialization its basic effort. Under conditions of crisis or catastrophe—war, pestilence or famine—enhanced coercion such as dictatorship is often set up because the mores are relaxed, men are at loose ends, standards and conventions go by the board, society tends to break down from an organization of institutions into an aggregation of individuals and a succession of mobs. Sometimes the opposite occurs, coercion at one point being compensated for by looseness at another: as in the antithesis between the puritanic character of American mores in matters of sex and art and the unscrupulousness of business practise.

Social inheritance and thence civilization rest on the primary coercion of youth by age. Tradition and custom rest upon the ineradicability of experience imposed on infancy and upon consequences to the individual through membership in a group. When faith fails that the latter are good, coercion awakens resistance, counter-coercion; "civil disobedience" gets described as duty; government faces rebellion; church faces dissent. The upshot of such confrontations is either the extirpation of the opposition or the multiplication of sovereignties.

In western thought coercion became a moot question in politics with the consolidation of monarchical states; in religion with the success of the Lutheran heresy. Hobbes' *Leviathan*, Spinoza's *Tractatus politicus* and *Tractatus theologico-politicus*, Locke's essays on *Civil Government* and on *Tolerance* attest the rise of the question through the confrontation of practically equal powers and the consequent need of each side to rationalize and justify its own desire. Since Locke the logical defense of coercion has become more and more difficult. Thinkers like Godwin, in his *Political Justice*, reject it altogether and the philosophy of anarch-

ism has followed his lead. Its logic is infallible but, since coercion is inherent in the nature of things, barren. The utilitarians appear to have pursued a more fruitful line of analysis. Philosophers of the industrial revolution in England, they argued against the restrictions of society upon enterprise and innovation, maintaining that natural coercion is enough; "laissez faire," they said; the consequences determine whether a coercion evokes conformity or rebellion. So contended Bentham in his *Principles of Morals and Legislation* and Mill in *Liberty*. Their views have influenced considerably the later developments of law and business practise; in the speculative domain they have been superseded by others which draw heavily upon the biological and psychological disciplines.

COEUR, JACQUES (1395-1456), French merchant and financier. Cocur (or Cœur), the son of a small merchant of Bourges, became inspired as a result of his early travels in the Levant to try to free French commerce from the control of the Venetian and Genoese merchants. He organized and solidified the French markets and made Montpellier an important center of Levantine trade. He owned and operated a large commercial fleet, had more than three hundred factors in branch houses throughout the land, operated a silk factory at Florence, a paper mill at Bourges and mines of silver, lead and copper, ran a large passenger service for pilgrims to the East and amassed a fortune estimated at twenty-seven million francs. Cœur placed his riches at the disposal of Charles VII for the recovery of the kingdom and became first the king's master of the mint and later his steward. His position of power and eminence and his lack of scruple, however, aroused the hatred and jealousy of the petty merchants. They brought about his arrest and trial on the charge of having poisoned the king's mistress. Cœur managed to escape to Rome in 1455, was well received by Pope Calixtus III, but died the following year at Chios.

Banker and creditor of king and lords, honored by the pope and raised to the nobility by the king, in touch with the rulers of the East and the great merchants of the world, patron of the arts

and displayer of an aggressive luxury, Coeur is a typical representative of the rising bourgeoisie of the late Middle Ages which became allied with the crown against the old landed aristocracy. He gave the needed impetus to the entrance of the merchant class into public life and heralded their increasingly important participation in the disposal of all significant matters of state.

COGHLAN, TIMOTHY AUGUSTINE (1856–1926), Australian statistician and civil servant. With the exception of unimportant intervals Coghlan devoted his life to public service in New South Wales. After working in the departments of Public Instruction and Public Works he was appointed in 1886 to the newly created position of government statistician and served in this capacity for nineteen years. He was a member of the Public Service Board, chairman of the Central Board of Old Age Pensions and Registrar of Friendly Societies. In 1905 he was appointed agent general for New South Wales in London, a position he filled almost continuously until his death. He served on various royal commissions and represented the Commonwealth of Australia on the Pacific Cable Board. He was a fellow and member of Council of the Royal Statistical Society, London, and a member of the Institut International de Statistique.

As government statistician, a position for which he had originally no particular training, Coghlan was responsible for the compilation of a number of valuable statistical summaries, some of which covered not only New South Wales but also the six other Australian states. He directed the censuses of 1891 and 1901 in New South Wales and he manifested a keen interest in vital statistics. He attempted an enumeration not only of the deaf, dumb and blind but also of the sick and infirm according to age and occupational groups. In the field of vital statistics his special studies include the *Decline in the Birth-Rate of New South Wales* (Sydney 1903) and *Childbirth in New South Wales* (Sydney 1899). He was responsible for the compilation in 1892 of the first official life

table in any of the Australian colonies. The special reports on vital statistics for New South Wales, still being published, were inaugurated in 1899, while he was in office. One of his most important works was the four-volume *Labour and Industry in Australia* (London 1918), in which he traced the influence of such factors: as immigration, land legislation, prices and political action from the first settlement in 1788 to the establishment of the commonwealth in 1901.

CHARLES H. WICKENS

COGNETTI DE MARTIIS, SALVATORE (1844–1901), Italian economist and sociologist. Cognetti endeavored to found a positivist school which would reconcile the classical and historical traditions and introduce the exact inductive method of physical science which Herbert Spencer had applied to the biological and social sciences. His theory and discussion of its application are to be found in *L'economia come scienza autonoma* (Turin 1887; first published in *Giornale degli economisti*, 2nd ser., vol. i, 1886, p. 166–203) and “Lo spirito scientifico negli studi sociali” (in *Riforma sociale*, vol. ii, 1894, p. 673–92). His two most important works are *Le forme primitive nella evoluzione economica* (Turin 1881) and *Socialismo antico* (Turin 1889). In the former Cognetti traced the evolution of major economic phenomena (division of labor, production, exchange, etc.) from the purely functional activity of self-preservation to the most developed forms of animal and human society. In *Socialismo antico* he employed the same genetic method to trace the forms of the ideal state through the centuries and to discuss the imaginary systems for the attainment of social happiness. As editor of the fourth series of the *Biblioteca dell'economista* Cognetti was guided by similar scientific standards.

P. JANNACCONE

Other important works: *L'evoluzione della vita e della cultura economica* (Turin 1896); *I due sistemi della politica commerciale*, 2 vols. (Turin 1896); “Formazione, struttura e vita del commercio” in *Biblioteca dell'economista*, 4th ser., vol. ii (1899) pt. i, p. i–cxlv; “Le più recenti indagini statistiche sugli Scioperi” in *R. Accademia delle Scienze di Torino, Memorie*, 2nd ser., vol. xlv (1894) pt. ii, 1–20; *Abrams Lincoln* (Mantua 1873); “La circolazione della ricchezza negli Stati Uniti d'America” in *Biblioteca dell'economista*, 3rd ser., vol. i, 47–151; “Il socialismo negli Stati Uniti d'America” in *Biblioteca dell'economista*, 3rd ser., vol. ix (1891) pt. iii, 1–304.

Consult: Jannaccone, P., *Biblioteca dell'economista*, 4th ser., vol. v (1901) pt. ii, p. clxxxi–ccvii.

COHEN STUART, ARNOLD JACOB (1855-1921), Dutch economist. After finishing his studies as a civil engineer at Delft in 1878 Cohen Stuart entered the civil service in the Dutch East Indies. There he distinguished himself by a courageous attack on the technical methods of the higher officials in the form of a study of the port of Tandjong Priok. He returned to the Netherlands in 1884, where he took up legal and economic studies at the University of Amsterdam. Attracted to the problems of progressive taxation by an appeal by Pierson in *De gids* (4th ser., vol. vi, pt. 1, 1888, p. 287-318) for a mathematical treatment of these problems, Cohen Stuart followed in the footsteps of a group of Dutch economists, including Pierson, Treub and Cort van der Linden, who had studied progressive taxation in the light of an application of marginal utility theory to the doctrine of equal sacrifice. His brilliant doctoral dissertation *Bijdrage tot de theorie der progressieve inkomsten belasting* (Contribution to the theory of the progressive income tax; The Hague 1889) is a classical treatment of the problems arising from the search for a scale of progression which distributes the burden of taxation according to equality of sacrifice. After an acute formulation of the distinction between the concepts of "ability to pay" and "equality of sacrifice" Cohen Stuart comes to the conclusion that just taxation involves taxing the individual "in such a way that for every one the amount of enjoyment (*genot*) of which he is deprived through the tax may be proportional to the total amount of enjoyment attainable through his economic condition, with the exception of the part which is required for the satisfaction of his absolutely necessary wants." Thus stated the problem becomes one of the mathematical relation between enjoyment and income, and Cohen Stuart first proved that the arguments used thus far (based on the assumption that greater incomes are worth relatively less than smaller ones because of the decreasing intensity of human wants) do not necessarily lead to progression, but that the possibilities of proportionality or even regression remain. He then attempted to construct his own ideal curve of progression, based on hypothetical data. His attempt has been criticized by Seligman on the ground that his conclusions depend "not only on the arbitrary assumption of a definite ratio of marginal utilities, but also on the equally arbitrary assumption of a definite minimum of subsistence." Although he was twice seriously considered for

the chair of economics at Amsterdam, Cohen Stuart failed to find a place in academic life. After a distinguished career as a consulting specialist he accepted a position with the Royal Dutch Petroleum Company in 1900 and became one of the leaders in its development.

HARRY D. GIDEONSE

Consult: Edgeworth, F. Y., in *Economic Journal*, vol. xxxi (1921) 414-15; Sandick, R. A. van, in *De ingenieur*, vol. xxxvi (1921) 604-06; Seligman, E. R. A., *Progressive Taxation in Theory and Practice* (2nd ed. Princeton 1908) p. 218-23, 278-84.

COHN, GEORG LUDWIG (1845-1918), German jurist. He was at first professor at Heidelberg and later became rector of the University of Zurich. He was a pioneer in German comparative jurisprudence, his special field being comparative commercial law, particularly the law of exchange and of checks, interests which grew out of three years' practical banking experience. Although Cohn was not the first German jurist to comprehend the importance of the studies of foreign law for the development of German codification, he was undoubtedly one of the first and most important propagators of the idea of the unification of the international laws of exchange. His program was somewhat reminiscent of the suggestions of Accarias de Sérionne (1706-92) and of the recommendations of his Dutch contemporary, T. M. C. Asser (1838-1913). To further the realization of his proposals Cohn published a series of studies on the modern codifications of the different European countries as well as of the United States. His greatest contribution, however, was the founding with Professor Bernhöft in 1878 of the first German review of comparative jurisprudence, the *Zeitschrift für vergleichende Rechtswissenschaft*, in Stuttgart. Cohn represented the modern branch of the new science, while Bernhöft occupied himself chiefly with the historical branches. The review came to exercise great influence upon the development of comparative jurisprudence in Germany, especially after Josef Kohler became co-editor in 1882; the most important of Cohn's own works were published in its volumes. His labors in the field of old German law were of comparatively less importance.

LEONHARD ADAM

Consult: Kohler, Josef, in *Zeitschrift für vergleichende Rechtswissenschaft*, vol. xxxv (1918) 479-80.

COHN, GUSTAV (1840-1919), German economist. Cohn taught at the Riga Polytechnic from 1869 to 1872 and after spending a few

years in England became professor at the Zurich Polytechnic in 1875. In 1884 he was called to a chair in Göttingen, where he remained for the rest of his life.

Cohn was not primarily a theorist. In his writings on general economics, which include the first volume of his *System der Nationalökonomie* (3 vols., Stuttgart 1885-98) and some articles in the collections *Volkswirtschaftliche Aufsätze* (Stuttgart 1882) and *Nationalökonomische Studien* (Stuttgart 1886), he endeavored to synthesize the classical doctrines with the newer historical and social tendencies and laid particular stress on the social-psychological and ethical factors in economic life. These works are marked by a philosophic breadth of view and an unusual felicity of style and earned for him in Germany the reputation of the foremost economic essayist of his time.

Cohn's important contributions were made in the fields of transportation and public finance. His *Untersuchungen über die englische Eisenbahnpolitik* (2 vols., Leipzig 1874-75), based on several years of close study, laid the foundation for all subsequent treatises on railway theory and policy such as, notably, A. T. Hadley's *Railroad Transportation* (New York 1886). In this work Cohn utilized for the first time the rich mine of materials found in the proceedings of parliamentary commissions, but he did not always allow for the fact that testimony before the commissions was often in the nature of special pleading. He was a strong advocate of railway amalgamation and government ownership and an equally strong opponent of canal construction. The *Untersuchungen* were supplemented by *Die englische Eisenbahnpolitik der letzten zehn Jahre (1873-1883)* (Leipzig 1883), the chapters on transportation in the third volume of his *System* and the articles collected under the title *Zur Geschichte und Politik des Verkehrswesens* (Stuttgart 1900).

Cohn was one of the famous quartette, of which Roscher, Lorenz von Stein and A. Wagner were the other members, who may be said to have founded the modern science of public finance. Beginning with *Finanzlage der Schweiz* (Zurich 1877) he remained the typical German exponent of the liberal Swiss ideas. His *Finanzwissenschaft* (vol. ii of the *System*, 1889) is particularly striking in its discussion of equities in taxation, dealing with such angles of the problem as the minimum of subsistence and the doctrine of graduation. The English translation of this work (by T. Veblen as *The Science of Finance*,

Chicago 1895) was, however, so deficient in form as to make little impression. He summed up some of his later contributions to finance in *Zur Politik des deutschen Finanz-, Verkehrs-, und Verwaltungswesens* (Stuttgart 1905).

EDWIN R. A. SELGMAN

COINAGE. Previous to the invention of coinage practically all movable goods, sometimes even immovable property, like the carved rocks (*feis*) on the island Yap, were used as means of exchange or standards of value. Sometimes also a number of such objects were related to one another so as to represent a scale of values. Primitive peoples employed as money in intra-tribal exchange goods which served as the customary evidence of wealth in the community, and in trade with outsiders the selection of goods for monetary uses was determined by the preferences of the alien merchants. It is probable that systems of weights were first introduced in order to measure the precious metals. After such systems came into general use valuable raw materials in place of finished goods began to be used as money. This trend could be observed most clearly in the case of metals, which beginning with iron, copper and brass gradually superseded primitive media of exchange. The ancient civilizations reached this stage of development about the eighth century B.C., China even earlier, and in modern times savages were found to have approached it in many instances. In the West the first known example of coinage is recorded as occurring in Lydia, where in the seventh century B.C. stamped pieces of electrum, a mixture of silver and gold, were produced.

The choice of the metals was dictated at all times by immediate economic needs and opportunities rather than by the prescriptions of the ruling power. The development of wealth and commerce, however, soon overcame the limitation upon the choice of the metals which had been due to their geographical distribution. In this manner may be interpreted the choice of silver and later of gold in ancient Greece as well as the use in Rome immediately after Caesar's death of gold coins to supplement brass and silver coinage. In the early Middle Ages, because of the predominance of barter, only copper and silver were coined, with the exception of the temporary minting of gold under Carolingian rule. As a demand for the larger coins subsequently arose gold was reestablished, beginning with the Florentine florins and the Venetian

zecchinos. Gold has ever since been the favored money metal, especially in international trade.

The development of the technique of coinage was rather slow. Nevertheless, the Greek and Roman world, thanks especially to the initiative of Athens, was already producing a sufficient number of fine and comparatively uniform pieces to allow a currency by tale of small units at least. The Middle Ages continued the use of the ancient technique, namely, the laborious designing and cutting of the coin types and the striking or hammering of individual coins by hand. The sixteenth century witnessed the introduction of mechanical methods of minting and their application to the preparatory manipulations (rolling, cutting) of the metal as well as to the coining process itself (milling of coins), but it was not until the next century that these devices overcame the opposition of the moneyers' guilds and other bureaucratic hindrances. Even greater progress was made through the application by Boulton in 1786 of steam power to minting, through the development of chemical processes in handling the raw metals and through the numerous mechanical innovations of the nineteenth century. One of the most important of these was the lever press, which was invented by Uhlhorn in 1839 and enormously accelerated the striking of coins.

The economic significance of this technical development was far reaching. It resulted in a substantial reduction in the cost of minting; the cost of production, which as late as the eighteenth century ranged from 10 to 20 percent of the value of the coin, has been reduced for gold coins to less than one third of one percent. Moreover, it made possible the minting of coins of uniform shape and content and thus provided a currency which could be circulated by tale. The passing of money by weight, a practice current to a considerable extent in Rome, under both the republic and the empire, in the Middle Ages and even in early modern times, became unnecessary. The indirect means of securing a stable standard of value, such as the ideal money of account (e.g. *Kölnische Mark*, *livre de compte*), the use of which was enforced either by law (under Athenian and Roman rule) or by universal custom, were rendered superfluous. Similarly the mediaeval Italian and Dutch methods of effecting payments through transfer banks without the actual passing of coin became obsolete. Likewise the "coinage alliances" organized by the German cities in the Middle Ages were no longer necessary.

Technical improvements permitted also the erection of additional safeguards against the abuse of currency by outsiders, by the employees of the mint or by the holders of the minting concession. Such malpractices as existed in the *Kipper und Wipper* period in sixteenth century Germany had been a serious obstacle to capital accumulation and one of the causes of social unrest at the time of the rapid expansion of the money economy. It was important, therefore, that the milling of coins introduced at the end of the seventeenth century succeeded in putting a stop to money clipping, and that Gengembre's invention of 1808, which mechanically adjusted and controlled the metallic content of coin, reduced the opportunities for counterfeiting.

The modernization of minting technique solved also one of the most pressing of the early monetary problems, the shortage of coin. The inadequacy of the monetary supply was probably responsible for the adoption of such temporary expedients as the production of bracteates, diminutive pieces of metal so thin that one stamp sufficed for both surfaces, and the private issue of token coins. Thus a great quantity of copper farthings were issued without royal concession in England in the seventeenth century. Such devices could be dispensed with after the introduction of the modern minting machine, with its daily capacity of 100,000 perfect coins as compared with the 8400 badly stamped groschen which were considered a good day's work in seventeenth century Prussia.

Changes in the administration of coinage went hand in hand with its technical development. Beginning in the ancient world, probably with the governmental coinage of the Persian kings, minting has been regarded as a prerogative of the ruling power. In the Greek communities this prerogative was a cause of strife between the political parties, and the emergence of tyrants was likely to mean a pronounced centralization of the coinage. In Rome centralization ruled from the beginning and, naturally enough, the emperors put great emphasis upon the exclusive character of their privilege to use and abuse the mint. This imperial prerogative was perpetuated as part of the tradition inherited by the Middle Ages and was exercised either by the suzerain or by persons who had received it as a feudal grant. As a natural consequence of the lack of communication these grants multiplied to such an extent between 800 and 1200 that the coinage was completely decentralized. During the earlier Middle Ages this situation was of only limited

importance, because with the prevalence of a "self-sufficient" type of economy, exchange resembled in the majority of cases simple barter. In Germany, for example, copper and small silver pieces, pfennigs and half pfennigs were practically the only coins minted until the end of the thirteenth century. Later this decentralization of minting authority threatened to have more serious consequences. From the time of Saint Louis in France and Henry VII in England, however, these countries witnessed the gradual extinction of all but the royal minting power. In Germany, on the other hand, the decline of the emperor's political position resulted in a further dispersion of the minting prerogative among thousands of feudal barons, bishops and cities. None of the numerous decisions of the later Reichstags, which did their best after 1566 to reform by legislation the confusion of the monetary system of the empire, could achieve even a comprehensive monetary union.

Apart from lack of centralization, the coinage policy of the entire period from the twelfth until the end of the eighteenth century suffered from the fact that the minting privilege, like other royal privileges, was exploited with a view to obtaining therefrom the greatest possible revenue. The earnings of the mint per piece coined depended not only upon the margin legally permitted between the face value of the piece and its metallic content (seigniorage), but particularly upon the gradual and unauthorized reduction in the bullion content of the standard unit or in the weight and the fine content of the individual coins. But more important from the standpoint of total revenue derived was the output of the mint; to increase the turnover of the mint, changes in the coin, with the consequent renewal and reminting, were continually undertaken.

Changes in the coin were accomplished either by raising the face value of the coin or by reducing its metallic content. With the issue of new depreciated coins old coins were generally although not always "called down" for reminting in accordance with the new standards. After the coin was thus increasingly depreciated for some time, the reverse measure had commonly to be resorted to and this "raising" of the coins was again cause for a new reminting. Thus in some parts of Germany and Austria in the fourteenth century the cities would purchase from the feudal mint owner his privilege of controlling the regularly repeated deteriorations of the coin and then raise the value of their moneys by remint-

ing. Analogous to a change in coin in its effect upon recoinage was a change in the uncoined monetary unit which was at the basis of the system of coins actually circulating; such a change involved a readjustment of money in circulation and often meant the coinage of new pieces.

Frequent remintings were also caused by circulatory difficulties arising from the imperfections of minting technique and monetary policy. Payments in terms of a stable money of account, which were practised widely for a long time because of the unsatisfactory state of coinage, would lead to the withdrawal from circulation of the heavier coins. Thus within a certain period the coinage of a locality would be automatically "eased" and reminting had to take place. In addition, with the development of commerce and the appearance of gold coins, changes in the market value of gold and the resulting discrepancies between the market and the mint ratios of gold and silver would compel remintings. In countries without a central political organization, such as Germany and Italy, the competition of coins produced by different mints under different rules was recurrently advanced as a reason for recoinage. While the foreign coin competition argument was probably valid enough for very small political units which were not sufficiently strong to enforce the exclusive use of domestic coin even for the smaller transactions, this "economic" apology still advanced by some recent writers, Schmoller for instance, has no foundation in fact. Similarly, the argument of some mediaeval rulers and certain modern writers that the shortage of monetary metals necessitated a lowering of the monetary standard and remintings cannot be proved.

The history of coinage until the end of the eighteenth century in most continental countries is the history of a long and continuous series of experiments designed to make the mint yield the highest possible amount of net revenue. Some of its worst examples were found in German states and principalities. Even in France, where centralization set in early, Philip the Fair began a series of reckless monetary experiments. In England, however, beginning with the fourteenth century, Parliament and the moneyed interest were able on the whole to prevent abuse of the mint for fiscal purposes, although during the period of absolutism under Henry VIII and Edward VI their influence was not strong enough to keep England from undertaking coinage experiments of the continental type.

While attempts were made to improve conditions by such reforms as that of Queen Elizabeth in England and the reform of 1679 in France, the mediaeval coinage policy remained in effect until the close of the eighteenth century. This policy may be said to have come to an end with the abolition of seigniorage on standard coins and of all other practices involving manipulation of the coinage for the "illegitimate" profit of the mint. Connected with this change were the definite limitation of token coinage in circulation and the elimination of recoinages caused by the circulation side by side at fixed value ratios of gold and silver coins or of coins of different standards of weight and fineness.

COKE, EDWARD (1552-1634), English jurist. Coke's career as law officer, judge and parliamentary leader is part of the political history of his time. To politics he made the practical contribution of drafting the Petition of Right in 1628 and the theoretical contribution of reviving for a time the mediaeval notion of the supremacy of law (*Bonham's Case*, 1610). Against these, however, must be set his unfortunate attacks upon the courts of admiralty

and chancery which isolated the common law from the newer tendencies which these courts represented in commercial law and equity. Within the limits of the common law his work was marked by a cautious liberalism both in technical doctrine and in social tendency. The latter may be seen in his decisions in favor of copyholders.

His *Institutes* (pt. i published in 1628, pt. ii in 1642 and pts. iii-iv in 1644) and *Reports* (pts. i-xi published in 1600-15, pt. xii in 1656 and pt. xiii in 1659) occupy a unique place in legal literature. They were written at a time when the common law was embodied in the disorderly mass of yearbooks and statutes and when demands were being made (especially by Bacon) for codification and radical reforms in substance. Coke's work was to summarize the old apparatus for modern use, and in his works the profession found as many references to mediaeval authority as it cared to handle. As a result it was soon tacitly agreed not to go behind Coke's authorities; but this gain was accompanied by the disadvantage of permanently imposing upon the law the considerable mass of mediaeval learning which Coke delighted to display. His historical work was, however, always subordinated to immediate practical considerations, and so his pronouncements in this direction must be read with caution. This applies equally to the historical matter in many modern legal treatises whose authors, following their professional tradition, are content to accept Coke's authority in history as well as in law.

COLAJANNI, NAPOLEONE (1847-1921), Italian criminologist, statistician and publicist. He was born in Castrogiovanni, Sicily, and became early in life a Garibaldian patriot. He was

at first a surgeon (1871), then assistant professor of anthropology at Catania University and later (1901) professor of statistics at the University of Naples.

Colajanni's writings cover a wide variety of subjects and are mainly in a polemical vein. In his *Il socialismo* (Catania 1884, 2nd ed. Palermo 1898) Colajanni discussed socialism from an evolutionary point of view. He strenuously defended Mazzini against Marx, the clericalists and royalists (e.g. *Mazzini e socialismo*, Rome 1901; 2nd ed. 1921). In *Aspromonte* (Rome 1912) he criticized the role played by the royal house of Savoy in the history of modern Italy. He believed that the colonial expansion of Italy should wait upon the achievement of prosperity at home (*Politica coloniale*, Palermo 1891). Outstanding among his writings are his works on criminal sociology (e.g. *La sociologia criminale*, 2 vols., Catania 1889), in which he ascribed to environmental factors—especially those of the social and economic environment—the major cause of delinquency. Colajanni employed the statistical method in *Latini e Anglo-Sassoni* (Rome 1903, 2nd ed. 1906) to demonstrate that moral conditions in Italy compared favorably with those in the United States, and in *Socialismo e criminalità* (Rome 1904) to indicate the relatively low criminal rate in the socialist districts of Germany. His work on the elements of statistics, *Manuale di statistica teorica e demografia* (3 vols., Naples 1904; 4th ed. in 1 vol., Naples 1920), is full of wisdom and good sense.

As a member of Parliament and as editor for twenty-seven years (1895–1921) of the *Rivista popolare di politica, lettere e scienze sociali* (Naples) Colajanni took a pronounced liberal position and always favored the idea of an Italian republic. He was an adversary of German influence in Europe, which he believed reactionary and inimical to democracy. Though an ardent patriot he vigorously opposed legal uniformity and was attracted increasingly to the idea of federalism. In time he also modified his socialistic leanings to become an anticollectivist, largely because of his dislike of the antipatriotic tendency in international socialism. He was convinced that nationalistic forces such as language and historic tradition exerted a greater cohesive force upon a community than did the solidarity engendered by class consciousness and similar standards of life.

ROBERTO MICHELS

Consult: *Rivista popolare di politica, lettere e scienze sociali*, vol. xxvii (1921) nos. 17–18, which are de-

voted to a discussion of the life and work of Colajanni and which include also a list of his writings.

COLBERT, JEAN-BAPTISTE (1619–83), French statesman and administrator. As the son of a woolen merchant of Reims, Colbert no doubt received a sound training in commerce and banking. After a period of service in the war office and later in the household of Mazarin he became intendant of finances in 1661 and controller general in 1665. In this office he exercised not only the functions of minister of finance but those of minister of the interior. He also held the offices of secretary of the navy and superintendent of construction. As Marquis de Seignelay he played a role in the royal councils the more preponderant because he left apparent initiative to the king.

As minister of finance he attempted to establish order through definite estimates of future receipts and expenses and through elimination of waste. Although he was not able to change the deplorable system of taxation he managed to improve the position of the peasants by revising the lists. He found the state excessively burdened by debt and unfortunately resorted to measures which amounted to a declaration of bankruptcy, to the ruin of public credit. He hated the financiers but the war with Holland placed him in their power.

His economic theories were mostly those of Richelieu. He sought to make an economic unit of the nation by substituting uniform duties at the frontier for the multitude of provincial duties, but he was able to realize this policy only to a very limited degree. He conceived of the development of economic life as a public service and, like Richelieu, inveighed against the idleness of the nobles and the desire of the middle class for public office. He wished to see the population of France increase, and he wished all elements in the population to contribute as much as possible to the national wealth.

In some points his theories were narrow and reactionary as compared with the contemporary mercantilist theories. He believed that the population of each state and its power of consumption, the amount of money in circulation, the commercial possibilities and even the aggregate tonnage of the European merchant marine were virtually fixed quantities, and therefore that a state could enrich itself only at the expense of others, by waging a "war of money" on them. He detested Holland especially because that

country was then the reservoir of the precious metals and the market for capital and controlled three fourths of the commercial tonnage of Europe. While the principal object of the tariff of 1664 was customs unification, that of 1667 frankly represented tariff war and it was destined to lead to the calamitous war of 1672. Colbert opposed trade with the East because it involved export of gold; on this point he was in violent conflict with the people of Marseille.

The essential points in his economic policy were preventing the export of useful materials; attracting raw materials from abroad; prohibiting or at least taxing heavily imports of foreign manufactures; seeking outlets for French products; establishing in France new industries by inducements to skilled workers from France and from abroad; creating, as Henry IV and Richelieu had attempted, royal manufactures, establishments operated either by the state (for example the Gobelins) or by privileged manufacturers free from statutory regulations and the supervision of the guilds; reestablishing abroad a reputation for French products by subjecting the manufacturers as well as the traders to severe regulation under the control of inspectors of manufactures and of the Council of Commerce. Inspired by the example of Holland Colbert sought to liberate France from dependence on the foreign carrying trade. He believed that trading companies could be created by fiat prescribing the amount each capitalist should subscribe. The results of his efforts in this direction were mediocre. Colonies he regarded merely as objects of exploitation by the imperial state.

Colbert also played an important part in the unification and codification of the laws through ordinances on civil and on criminal procedure, on waterways and forests. By the *Ordonnance du commerce* of 1673 he restored confidence in the word of the French merchants by imposing upon them ruthless regulations. Toward the close of his career he worked out the *Ordonnance de la marine* and the *Code noir*, or ordinance on the Negroes of the colonies, proclaimed in 1685 after his death.

Colbert even played a part in the intellectual supremacy of France under Louis XIV. It was his dream that alongside of the administrative organs controlling the national life a government of experts and savants might be established for the king. While he protested against the ruinous waste of Versailles he pensioned learned men and artists of all countries, established academies (of inscriptions, of sciences and the French

Academy at Rome) and scientific institutions (observatories, schools of languages).

He was less a great statesman than a great clerk, admirable for his industry, love of order and passion for detail. His conception of national economy, his creation of a marine and a class of sailors, his engineering works such as the Canal des Deux-Mers, contributed toward a sense of national unity and grandeur. But his narrow mercantilism with its strongly belligerent tendencies and his spirit of authoritative regulation indicated a reactionary intelligence. After his death "Colbertism" degenerated into a meddling tyranny over industries, an obstacle to progress and trade.

COLERIDGE, SAMUEL TAYLOR (1772-1834), English poet, philosopher, literary critic and journalist; one of the leaders of the English romantic movement. At first a Godwinian, he soon took up journalism on the Tory side. Especially after 1815 his writings developed into a series of attacks on "Jacobinism," which he defined as an attempt "to build up government and the frame of society on natural rights instead of social privileges, on the universals of abstract reason instead of positive institutions, the lights of specific experience, and the modifications of existing circumstances." Similarly he criticized utilitarianism and classical economics because of the philosophical and psychological inadequacy of the former and the unduly abstract arguments of the latter. He pointed to the unemployment and poverty accompanying industrial progress and declared that these could not be remedied

on the principles of individualism and laissez faire. There seemed to him a special need for governmental interference to insure a prosperous agricultural population, to prevent the exploitation of children in industry and to establish a national system of education. In his mature political thinking Coleridge followed Burke, although laying even greater stress on the importance of psychology and history as the bases of politics. While considerably influenced in his general philosophical thinking by the German idealists, he disliked their emphasis on the state; the idea of sovereignty he described as a "mischievous hyperbole." Apart from his great influence on religious thought Coleridge's political and social ideas were carried on by various writers including Southey, Lord Shaftesbury, F. D. Maurice and the Christian Socialists, Matthew Arnold and J. S. Mill.

ALFRED COBBAN

Important works: Coleridge's most influential work in the field of social thought was his *On the Constitution of Church and State* (London 1830; 4th ed. 1852). Important also are his writings in *The Friend* (London 1809-10; second version, 3 vols., 1818), and his *Essays on Our Own Times*, 3 vols. (London 1850).

D., *Coleridge on Logic and Learning* (New Haven 1929).

COLINS, JEAN HIPPOLYTE, BARON DE (1783-1850), Belgian collectivist thinker. Colins served with distinction as a volunteer under Napoleon and after the Restoration was exiled. In 1819 he went to Havana as a physician but following the Revolution of 1830 returned to Paris, where he set out in middle age to study and develop his system of social reform known as "rational" socialism.

Despairing alike of the theocracy of the past and of the anarchic democracy of his time Colins sought for a seat of "real authority, rationally incontestable" to persuade men to be brothers. He discovered it in the "feeling of existence," which proved the immortality and hence the moral responsibility of the soul. He deduced that ignorance and pauperism are unnecessary. Even

those who "by their own folly" have become unproductive should be "maintained in plenty and well-being." All men should have free access to the soil and to the accumulations of past generations. Land and most capital goods should therefore be collectively owned but privately worked (on thirty-year leases) with rent applied to social purposes. During the transition period to the "rational" order society was to accumulate wealth by 25 percent inheritance taxes and by the reversion to the state of all intestate land lapsing out of the direct line of descent.

Colins attacked the extreme individualism of Proudhon, and in the ranks of the First International his followers, who advocated the collective ownership of the soil, formed a transition group between the "mutualists" and the Marxians. Later Colins' disciples, De Potter, Brouez and others founded the "Ligue pour la Nationalisation du Sol," which is still active.

DOROTHY W. DOUGLAS

COLLECTIVE BARGAINING is a process of discussion and negotiation between two parties, one or both of whom is a group of persons acting in concert. The resulting bargain is an understanding as to the terms or conditions under which a continuing service is to be performed. There is collective bargaining between apartment dwellers and a landlord, the cooperative producers of tobacco or cotton and the buyers, the distributors of milk in a large city and the dairymen, a public utility and the users of its product. More specifically collective bargaining is the procedure by which an employer or employers and a group of employees agree upon the conditions of work. The institution is both a device used by wage workers to safeguard their interests and an instrument of industrial organization.

The use of collective bargaining and the maintenance of labor unions are now almost inseparable. Workers may organize for another purpose—a union of employees to control conditions of work may require only an informal

understanding—but in general collective bargaining is the activity about which trade unions are built up. The necessity of collective bargaining leads to a definition of the aims of the working group and to the development of working rules involving the regulation of the number of apprentices, the maintenance of a shop closed to non-union members and the subordination of individual interests to a common discipline. The concert of action makes the suspension of work, popularly called the strike, an effective weapon in use or as a threat. Accordingly, the extent of effective employment of collective bargaining is the extent of successful unionism; the history of collective bargaining is inseparable from the history of organized labor.

A process of collective bargaining may take any one of a number of forms. A single employer may bargain with a group of employees, as the proprietor of a restaurant with his waiters; a local group of employers with a number of groups of employees, as the building contractors of a city with the several unions in the building trades; a number of sectional groups of employers in an industry with the employees of a single craft, as the railroad companies with the locomotive engineers; a group of employers with all their employees, as the bituminous operators and mine workers in the Central Competitive Field. There may even be a hierarchy of a local, a district and a national process of bargaining, as in the ship building industry in Great Britain. A great diversity in the processes of industry, the character of trades, the structure of unions and the patterns of business organization promotes variety in the methods of bargaining, demands of those engaged different kinds of strategy, gives character to union programs and stimulates association among employers.

The actual conduct of collective bargaining only approximates the norm of free agreement between equally interested and equally powerful parties. The interests of the two groups are unlike, the concern of one being with an expense of production, the other with the means of livelihood. The organizations are unlike, the laborers being associated for the specific purpose of bargaining, the employers being organized for production and profit making. The employers act directly or through their appointed officials; the employees may use their business officials or employ other representatives of their own choosing. A group of workmen may find discretion elsewhere than with their own employers and include in a local agreement provisions

formulated by an association of employers. The party which employs may find discretion elsewhere than with its own employees, as when standards and working rules formulated by an international are incorporated into agreements made with local unions. The discretion may belong so exclusively to one of the parties that the bargain is in name only, as when a hold-up union dictates to employers or a business corporation uses a company union to give a rhetorical sanction to arrangements made in the business office. A system of governmental arbitration, as in Australia or Canada, or upon the railroads in the United States, may result in one or both parties giving a grudging assent to provisions they are reluctant to accept. There can hardly be a "true" collective bargaining; in its practical application it becomes entangled with and inseparable from other arrangements which control employment relations.

The process of collective bargaining results, not in a labor contract, but in a trade agreement. This imposes no obligation upon the employer to offer or upon the laborers to accept work; it guarantees neither to the employers workmen nor to the laborers jobs. It is nothing more than a statement of the conditions upon which such work as is offered and accepted is to be done. The contract of employment is still between the individual employer and the individual employee, though the provision of the order in which men are to be taken on and laid off may give to or withhold from laborers a chance to dispose of their services.

It is through the trade agreement, which is subsumed in the labor contract, that collective bargaining becomes an agency of industrial order. The trade agreement, which specifies how jobs and workmen are to be brought together in production, like a creed or a code, is of slow and tangled growth; the repetitious process of bargaining is the procedure by which the scheme of employment relations is built up and maintained. The general understanding is primarily concerned with wage rates; it is easily extended to the times and methods of wage payment, hours of labor, compensation for overtime, fines for infractions of rules, allowances for dead work, the protection of life and limb and hiring and firing. It may lay down the conditions of work in great detail, incorporate a code of working rules or specify technical practices, ways of handling materials, methods of checking results and standards of performance to test the competence of workmen. It gives nom-

inal acceptance or even official sanction to customs, practises and procedures which have gradually grown up in a trade or industry. The constructive use of collective bargaining and the enforcement of trade agreements demand strong and continuing organizations and the faithful performance of obligations on both sides. As an instrument of order the bargain may be applied to the affairs of others than the bargainers, as when a court of arbitration extends a trade agreement to outside firms, or when the non-union part of an industry follows the lead of union shops. Thus a sliding scale of wages, negotiated by less than one half the employers and one third of the laborers, has been applied to the whole of the coal industry in South Wales.

The case for or against collective bargaining turns upon the issues of competition and personal freedom. Its opponents argue that the individual competition of employer with employer for workmen, and of laborer with laborer for jobs, through the law of supply and demand, makes alike for rightful labor costs and for fair wages; it is retorted that workers are at a disadvantage and that collective bargaining is a means of establishing that equality of bargaining power in which freedom of contract begins. Its opponents argue that it deprives the laborer of his individual liberty to dispose of his services upon such terms as he pleases; it is retorted that his individual freedom is an impotent abstraction and that he must endure the authority of a union, in whose control he has a voice, or else submit to the dictation of a business corporation. The issue involves alike the antithetical interests of economic groups and the conflicting philosophies of individualism and collectivism.

The legal status of collective bargaining cannot be set down in definite terms. The common law doctrine of restraint of trade carries at least a presumption of illegality in a monopoly of labor. Before their revision in 1824-25 the conspiracy laws in England expressly forbade associations of workmen for bargaining purposes. Today a bargain between employers and employees which amounts to a monopoly control of production would doubtless be held illegal. Monopoly aside, the process of voluntary collective bargaining is clearly within the law. In Germany and elsewhere on the continent the terms of the collective agreement are made legally binding, and members of employing or employee groups may not enter into individual contracts in violation of its minimum require-

ments. In the United States and Great Britain the resulting bargain is as a rule without, rather than against, the law; its enforcement rests rather upon the good faith of its makers than upon the right of a resort to the courts to secure damages or specific performance. In fact the effective use of collective bargaining has been seriously limited by a legal ban upon many of its instrumentalities. The lawful limits of the use of the strike have been only crudely indicated. The intervention of the state to make effective the bargaining power of employees has been found to be an unwarranted interference with individual liberty which "no government can willingly tolerate in a free land" [*Adair v. United States*, 208 U. S. 161 (1908); *Coppage v. Kansas*, 236 U. S. 1 (1915)]. An attempt to relax the antitrust act to allow trade unions a wider latitude in manoeuvring for position (Clayton Act, Sections 6, 20), whether because of clumsy working or judicial disapproval, has been of little avail. The free use of the secondary boycott of non-union firms [*Duplex v. Dearing*, 254 U. S. 443 (1921)] and of non-union materials [*Bedford Art Store v. Journeymen Stone Cutters*, 274 U. S. 37 (1927)] has not been permitted to labor organizations. However, in arbitration provided by federal statute, a railroad company has been compelled to dissolve a company union and to negotiate with employees through representation of their own choosing [*Texas and New Orleans Railway v. Brotherhood of Railway Clerks*, 281 U. S. 548 (1930)]. In general the activities associated with collective bargaining have not yet been reconciled with a legal system saturated with an individualistic common sense.

In the theoretical literature the possibilities of collective bargaining are clearly recognized. The American Federation of Labor in its wage declaration of 1925 favors a control through collective bargaining of the sources of increased production and higher wages. It has often been suggested that labor unions incorporate themselves and contract with employers to furnish a definite number of workmen for a definite term. It has been proposed that an industry be put under the control of a business corporation, that consumers and workers each elect one half of the directors and that its conduct be made a continuous process of collective bargaining between the two interested parties. Current changes and speculative thought alike indicate that collective bargaining will continue to take on new forms and new activities, that in the immediate future

the institution is not likely to be reduced to a rigid pattern.

COLLECTIVE BEHAVIOR. Society in its most obvious aspects presents itself as a mere agglomeration of individuals, a population aggregate. The very proximity and dispersion of individuals limit and condition to a greater or less extent all other human relations. But more significant is the fact that under certain conditions such temporal and spatial aggregates have a capacity for collective and concerted action.

Whenever individuals come together even in the most informal way, no matter how strange they may be to one another nor how great the social distances that separate them, the mere fact that they are aware of one another's presence immediately sets up a lively exchange of influences, the first effect of which is to produce in each a mood, a *Stimmung*, under the influence of which the individual's behavior—his thought and sentiments if not his actions—are controlled and directed. A funeral, a wedding or merely a picnic tends to evoke the sentiments proper to it and to create in the assemblage the atmosphere congenial to the occasion. In so far as every individual in such an assemblage is moved to think and act under the influence of a mood or state of mind, in which each shares and to which each contributes, the resulting behavior may be described as collective.

This phenomenon of collective behavior has in recent years led to the development of a special branch of social psychology, collective psychology, the chief aim of which is the analysis of the conditions under which concerted action ordinarily takes place and the forms in which collective behavior commonly manifests itself. Collective psychology is not concerned, at least in the first instance, with the mores and folkways nor does it assume the existence of a social organism. It starts with the obvious fact that individuals, visibly isolated in space and capable of independent action, do act in a manner that exhibits concert and control, even where that control is not imposed by conscious understanding, by convention, tradition or even habit. It recognizes, indeed, that in many instances collective action takes place in contravention of existing tradition and convention.

The range of collective behavior is far wider and its gradations more subtle than can be indicated in any scheme of classification. At innumerable points individual behavior fades into behavior under the domination of group attitudes. Collective behavior, ordinarily conceived of as emotional, may exhibit a high degree of rationality, as in the directed interaction of a group of technicians or workers. It may involve all degrees of fusing of the individual awareness with that of the group from the separateness of discussion groups to the single spirit of the mob.

The most elementary form of integration by which mere aggregates of individuals assume the character of social groups is the simple dominance of a mood. The ordinary street crowd, although it has not achieved that degree of integration which makes it capable of collective action, has at least this degree of integrity. It is the heightened influence of such a mood which creates the true crowd. Since the publication in 1895 of Le Bon's *La foule* collective psychology has been mainly concerned with the psychology of the crowd (*q.v.*). The general characteristics of crowds have been well explored and may be rapidly summarized. In the crowd social and personal distinction disappears; special talents and special knowledge, the fruits of education and experience, are lost; only those attitudes, passions and sentiments which are the common heritage of mankind remain. With the evolution of what Le Bon calls "the crowd consciousness" there is a corresponding loss of personality by the individual; he tends to act impersonally and to feel something less than

the ordinary responsibility for his actions. The crowd itself is anonymous, has no generally accepted function, is not recognized and does not recognize itself in any corporate capacity. The crowd that acts, in more extreme cases the crowd that dissolves in panic, becomes the mob (*q.v.*). There is another type of crowd that dances but does not act; the expressive and in its wilder manifestations the orgiastic crowd. Of this nature are the inspired and ecstatic participants in religious revivals.

It is probable that in any group, small or large, where rapport is established and maintained there is a certain diminution of that self-consciousness and self-control which the individual ordinarily maintains. "The result of intimate association," says Cooley, "is a certain fusion of individualities in a common whole, so that one's self, for many purposes at least, is the common life and purpose of the group." The control in the crowd is therefore not different in kind, even though it be so in degree, from that which is manifested in other intimate and congenial groups.

The crowd, however, is typically anonymous and casual; it presents decided contrasts to the collective behavior which is manifested in groups with definite traditions. The process by which sporadic collective behavior assumes institutional form can be clearly seen in the case of religious sects. Although they arise ordinarily out of the ferment of religious revivals and seek to maintain and renew from time to time the sentiments and attitudes in which they were originally conceived, sects characteristically develop traditions, attitudes and an organization which give unity and direction. A sect adopts ceremonial forms and acquires a creed, a mission and a program.

In secular life a group which has come together through chance may become sufficiently integrated to form a gang (*q.v.*), one of the groups most studied in recent years. A gang is a crowd which possesses a rendezvous and a habitat or locus that it regards as in some sense its own; more specifically, it is characteristically a conflict group. A gang is in reality an elementary form of political organization, acting frequently as an instrument of extralegal social control.

Most amorphous is that form of collective behavior which manifests itself through the expressions of "public opinion." The public is an entity which has never been clearly defined. One of the first attempts to distinguish between

the crowd and the public was made by Gabriel Tarde, in a paper entitled "Le public et la foule" (in *Revue de Paris*, 5th year, vol. iv, 1898, p. 287-306, 615-35). The public, according to Tarde, is a product of the printing press. The crowd is limited by the length to which a voice will carry or the distance that the eye can survey; and the relations which exist between its members are based on face to face contacts. The public, on the other hand, is composed of individuals who are not in immediate contact and whose reactions therefore are likely to be more deliberate. In the case of the public, where suggestions are transmitted in the form of ideas, there is "contagion without contact." Crowds attract and draw us into the circle of their influence; the influence the public exercises on the other hand is felt as "pressure." To this influence the individual never surrenders so completely as he does to the crowd attraction. He may be powerfully swayed by the current of public sentiment, but he will be able to maintain a certain amount of reserve and inner freedom. Frequently he finds additional resistance through membership in a party, supported by its dogmas, defending his position with the aid of its slogans.

The party is only one of the institutional forms through which public opinion eventuates in collective behavior. The whole governmental system may be regarded, from one point of view, as a formal medium for collective behavior. Such a concept acquires significance only when modified by a realistic analysis of the variety of groups and forms of group action to be found within any institutional system.

The entire range of types of collective action can be found in any community and in every field of activity; but certain types are most often associated with certain situations. The most complete fusing of the individual with the group occurs under the influence of religious excitement; closely akin to this is the fervor aroused by race or class prejudice; any threat to its existence or power, a real or supposed menace of war or revolution, will quickly draw together into one common hatred a group previously split in factions. The techniques for evoking and utilizing such forms of collective behavior have been known to all leaders. They are practised by trade unionist and club leader as well as by politician and priest. The process of social stabilization consists in the substitution for such forms of collective action more rational forms in an increasing number of

situations. Social force and social rules take the place of group conflict; mob frenzy gives way to discussion. But the growth of social habit can never prevent the operation of the dominant "mood" of a group; and as the methods for control of opinion become more effective and far reaching analysis of the roots of collective behavior is of increasing importance.

COLLECTIVE REPRESENTATION. *See* SOCIAL PSYCHOLOGY; GROUP.

COLLECTIVISM is the imposing word to be set over against individualism. It is, broadly, a term for a trend in social development, a program of economic reform, a theory of general welfare and a utopian order for mankind; technically, a general label for comprehensive schemes of authoritative control such as socialism, communism, syndicalism and Bolshevism; and specifically, a name for the trend away from the extreme laissez faire of the nineteenth century.

In a sense every social estate is a collectivism. The savage tribe hedges the doings of its members about with inviolate imperatives and tabus. The feudal regime assigns to each person a mode of life in conformity with the station to which he has been appointed. The tyranny enlists its subjects in His Majesty's service and exacts from them dues of grain, wine and labor. The dynastic state fashions people, resources and trades into an instrument of national greatness. The Christian society, for the glory of God and the salvation of the soul, extends a spiritual dominion over the actions, the words and the thoughts of men. In all such cases authority is from above and the individual is of less account than the impinging establishment.

The thing called individualism is a departure from—and a type of—collectivism. It is the product of the impact of novel event upon ancient authority. As Renaissance, Reformation and industrial revolution followed each other in startling succession, thought and activity could

no longer be pent up in accepted formulae. The scholar wanted to surprise truth in his own way; the God fearing man, to worship according to the dictates of his own conscience; the citizen, to be undisturbed in the exercise of his rights; and the merchant, to escape fostering restraints and to do as he pleased with his own. Practical men, such as these, asked only for a removal of particular restrictions. The times demanded no more than a release of spirit, mind and activity from outworn rule and form. But it was, for all its doubts, an age of faith in first principles, and the thinkers after their manner translated specific demand into abstract statement. The individual was the thing; self-interest was to public good as means to end; the actions of rational beings established and maintained society. Thus matters of common concern were transferred from the domain of man to the order of nature; thus too individual freedom became an instrument of organization. It was rested not upon right or privilege but upon social worth. Individualism was the way of an unplanned and undirected collectivism.

The new doctrine, "an atomic individualism" or "a natural collectivism," offered its challenge. It was easy to fasten a comfortable explanation upon actuality and to discover in the prevailing arrangements "the simple and obvious system of natural liberty." But as apologists came to defend as "free enterprise" or "capitalism" a homogeneous order such as never was, critics began to offer in "socialism" or "communism" a ready made hand-me-down substitute. When the state lost its omnipotence and the idea of democracy permeated reform thought, syndicalism and guild socialism became roads to salvation. The social utopia was a denial of the existing system, a replacement of the individual by the state, of freedom by authority, of the motive of gain by the spirit of service—and the trick was done.

The battle of ultimates was inevitable. Individualism was an expression of the philosophy of rationalism; collectivism went back to the authoritarian ideal. Alike they set down general welfare as the human goal, but in its definition a condition of well-being in society at large was opposed to an aggregate of the happiness of individuals. The one made man the hero and society the villain in the piece, the other crowded the state and the individual into the roles of father and child. In an evangelical clash, with absolutes as weapons, opposing argument was refuted more easily than defensive statement was

made secure. Man was not an enlightened being always capable of fending for himself, nor was he an ignorant person forever to be helped along the way. Human nature was not "a mechanism skilfully contrived to impel individual action to a divine purpose," but neither was it "a bundle of antisocial impulses." Nature, not God, or Providence, had so "contrived the frame of humanity" that one could not help himself "without promoting the common good"; but it was common knowledge that nature had done nothing of the kind. Authority hedged personal action about with arrangements which directed self-seeking to general ends, but evidence of such purposive compulsions was wanting. Thus it was, back and forth, endlessly, shrewdly, inconclusively. A last "it isn't that way" was met by a final "it can't be done." The popular victory of individualism was due not to good reasons or a worthy cause, but to the will to believe.

The argument, which could not be settled, gave rise to fertile inquiry. Admissions were made, "other factors" were recognized, exceptions obscured principles, the antithesis began to fade and a reexamination of social theory became necessary. The individual lives in society; each is inseparable from the other. Man is free to be, to choose, to do, within the limits of organized group life; he seeks worthy things—good name, wealth, achievement, personality, life—but always through social means; he depends for rich and varied opportunity upon a heritage of culture, the association of the likened and an organization of resources. The activities of the government instead of belonging in a province all their own permeate all human affairs. Business is not independent of government; property and contract, essential to its operation, are changing usages enforced by law. Authority is not limited to political control for man belongs as well to a moral, a religious and an economic order; upon him a host of formal and informal compulsions—customs, laws, traditions, associations, values, institutions, tabus—must of necessity impinge. The clash between individualism in general and collectivism in general is replaced by a myriad of distinct problems.

But understanding comes slowly, and circumstance rather than theory led the way toward an empirical collectivism. The state, which was supposed to keep in its place, thrust its will into private affairs. Self-interest is "the great regulator," but legislation has to be invoked against the farmer who keeps infected milk cows, the chemist whose dyes escape into a running

stream and the smelter who allows copper fumes to lay waste a countryside. The lure of profits puts shops in the right places, but cotton gins, merry-go-rounds and blast furnaces in the wrong spots are nuisances to be abated. Man is man and each for himself, but nature has wrought confusion with age and sex. Child labor must be prohibited. Women are unlike men; the long day causes fatigue and is a hazard to motherhood, and here a limitation of hours is a necessary exception. But men too are subject to fatigue; they are like women and are to be included in the exception. There must be no formal neglect of matters of general concern: state supervision is to insure sound banking; the trade in lottery tickets, white slaves and alcohol is prohibited; all are to be educated at public expense. The great prophets had said that "each shall count for one, and no one for more than one" and that "the greatest good of the greatest number" is the end of it all. It was the ironic fate of individualism to create in utilitarianism a standard by which its shortcomings were revealed. Instance after instance the obvious way to right a manifest wrong was an appeal to the government. Thus control from above took its opportunistic way through an individualistic system.

As from without so from within came a trend toward collectivism. In the whirl of change the individual lost his clear cut integrity and well defined province. The ingenious device of the corporation kept alive the fiction of "the private business" yet permitted the association of many kinds of property and many forms of personal service in a single enterprise. The use of trusteeship, the holding company and the interlocking directorate pyramided ownership, concentrated control, distributed discretion within a hierarchy of offices and confused the identity of the business unit with like and unlike ventures. In the domain of industry each functionary and factotum was free to do as he pleased—according to his position, within the established arrangements and in the face of circumstances not of his making. Even corporate personality, through which the individual lingers on, is a gift of the state.

In the realm of industry the resort to collective action is becoming common. The trade union exists "lawfully to further the legitimate objects of its members." Rules of apprenticeship, intolerance of the "scab" and methods of acting in concert make of the union card a pecuniary asset not inaptly described as property

The firms within an industry, as a precaution against cut-throat competition, establish gentlemen's agreements, research bureaus, societies of manufacturing chemists, iron and steel institutes and cement protective associations. A plethora of rotary clubs, chambers of trade and commercial fraternities furthers the cause of bigger and better business. Farmers, through cooperatives, attempt to impose direction upon a chaotic industry and restraint upon their disorderly ranks. Individuals, firms and corporations may affiliate with "societies for mutual benefit" or stay outside at their peril. An increasing number of voluntary associations imposes an imperfect discipline upon persons still legally free to do as they please.

Association has brought with it a growing use of collective devices. Merchants set up credit bureaus; banks establish clearing houses; advertising, auditing, promotion and what not are entrusted by many firms to a single specialist. The device of insurance enables a common provision to be made against the risks of death and of fire. The reform of work accident indemnity once sought only to give the workman the right of recovery possessed by the stranger; now compensation is "a necessary cost of production" assessed against the industry. Employment is no longer an arrangement between individuals; in organized trades its terms emerge from collective bargaining between the parties; and in unorganized trades the employer, a collective personality, lays down the conditions and the individual workman may take or leave the job. Without such collectivistic devices business could not be carried on.

Within industry a system of use and wont is emerging. A code of rules is beginning to govern hiring and firing; a job is a gift of a closed union or of a personnel test; discharge demands its own due process. Each industry, formally open to all who will take its chances, has its admission requirements which run in terms of capital, endurance, knowledge, policy and occasion. Business possesses in usages which center in the office and the market its own procedure for getting questions settled. It is, unlike the state, quite tolerant of the radical; he may depart from convention in making goods, handling employees or selling wares so long as he keeps expenses below receipts and obeys the general law of solvency. The minority by reducing costs and lowering prices may even force its advanced methods upon the conservative majority. The price system, from whose tyranny there is no

escape, has its ceremonial; bankruptcy has its effective way of sentencing the unfit. It is because they are of their own kind, quite unlike the familiar compulsions of government, that the conventions of business are little noticed.

Opinion is making a lagging adjustment to the collective character of business. The belief that the system works automatically is giving way to the demand that it be kept at work. An army of potential buyers must be stimulated by salesmanship; automobiles, typewriters and sewing machines must be pounded into junk; fashion and fad must rob goods of their worth before they wear out—or the flow of new goods will be blocked and plants cannot run at capacity. High wages promote spending and keep industry going; unemployment means workers without purchasing power. The reduction of wages and the laying off of men is a dubious remedy for hard times. The dawning responsibility of "the system" for the welfare of individuals rests upon business necessity. The gears must be made to engage; the making and the using up of goods must march along together; a great instrument of production which is "a concatenation of interlocking processes" must not be allowed to slacken or to stop.

In fact, almost unobserved there has appeared the great collectivism of business. Its technical activities have already been socialized. Funds, laborers, equipment, materials and brains are drawn together into establishments; productive units are gathered into none too orderly industries; industries are agglomerated into a crude and wasteful system. The business structure which envelops industrial activity is as yet inarticulate. The business unit has a clear cut identity; the industry has only such integrity as "the natural process of competition," kindly assisted by voluntary association, can give; the economic order, such as it is, is almost a by-product of innumerable individual and group activities. The scheme of authority over the industrial system is still inchoate. In the business unit lines of discretion are clearly marked out; in an industry individuals, firms, organizations and interests have their uncertain places in a scheme of direction; in the economic order, which knows nothing of potentate or council of wise men, a complex of controls holds sway. The state, charged with numerous duties, here and there exercises a negligent oversight. The market, over and behind all, works as well as it works in giving form and purpose to the everyday work of a people. In the cooperative enter-

prise each person has his place: to it he brings his mite of service or of property and from it he takes the wealth and the waste which make up his living. Apart from the great industry the individual cannot live his life; from its semi-responsible dominion there is no escape.

The domestication of business to social ends involves a protracted struggle along a scattering front. The narrow choice between overneat organizations has been succeeded by a complicated problem in detailed adjustment. The prevailing disorder invites an attack industry by industry. Each form of activity needs to be assigned to the appropriate agency: the rearing of children to the family, the defense of the nation to the government, the manufacture of shoes to business. But such words as family, government and business point directions rather than describe patterns of control. In business the ways in which the steel, the lumber, the newspaper and the amusement industries are put together make very different pictures; in government the postmaster general, the University of Michigan, the board of public works, the Port of London Authority and the Emergency Fleet Corporation are distinct types of control. The quest runs back of simple words like free enterprise, regulation and public ownership to the devices and procedures which make up an organization. Each separate activity—building, coal mining, street cleaning, preaching the gospel, banking—demands a scheme of arrangements in keeping with its technical processes and serving the purposes for which it exists. The way of order for an industry is one of endless choice.

There is need as well for a general attack upon specific failures in performance. The regulations set up to insure quality to the ware, service to the consumer, security to the investor, protection to the worker and opportunity to the management may well apply to many trades. The great hazards of life—sickness, accident, unemployment, old age—demand a collective provision which cuts across industrial lines. As technique develops, common sense changes, wants are revised and instruments of direction are remade, the scheme of control must respond. In time a more responsible business system may relieve the state of its current industrial functions. The arrangements for keeping business in order demand a continuing attention.

In the immediate future there is little hope for an articulate and responsible control of business. A barrier lies in a lingering application of individual terms to group activities. In law we speak

of the principal, the employer and the corporation as if they were persons; in economics a entrepreneur, once an owner manager, now a tangle of relationships, survives to obscure reality. We continue to talk of private property, free enterprise and individual initiative, when these institutions are to be found only in the backwaters of great industry. We persist in speaking of an alternative between "leaving" an activity "to the individuals concerned" and "the government's taking it over," when the real choice is between one set of human arrangements and another. Nor is outworn language, which confuses analysis, the only obstacle. At present direction over a myriad of separate and interrelated activities is scattered far and wide; each person whether of high or low estate is far more concerned with his own affairs than with everybody's business; the immediate, the specific and the personal are forever present to divert attention from larger and more lasting values. The culture we know, rich in particular activities and speeding toward an unknown future, cannot be made to obey a fixed purpose. In a world of human behavior and man made arrangements there is no escape from taking a chance alike upon personnel and upon institutions. We seek an order in which a collectivism that was never intended is subdued to the useful and the good; we must be satisfied with an approximation.

The commitment to collectivism is beyond recall, but its form remains to be determined. Its coming brings to social organization not an answer but a host of questions. The neat and tidy systems, in spite of a simple evangelical appeal, provide no escape from the road of detailed and painful adjustment. Experience quickly reveals behind the mask of comprehensive schemes like socialism, communism and Bolshevism the specific problems of functions, industries and interests, each one of which demands its particular attack. The collectivism that is, whether of business or the commune, will continue to receive such purposive revision as the concern of all sorts and conditions of men with their own petty affairs will allow. In a culture that lives and grows an empirical collectivism can never be reduced to the clear cut lines of a blueprint.

COLLETT, CAMILLA (1813-95), Norwegian writer and feminist. Her most popular work, *Antmandens døtre* (The governor's daughters, 2 vols., Christiania 1855, 5th ed. 1897), was the first Norwegian novel to deal with social problems. It pictured the sad fates of young women in the cultured but impecunious upper class who had no means of support except marriage and who were doomed by rigid decorum to perfect passivity in this most important question of their lives. She pleaded for the right of women to marry for love and to avow their feeling as openly as men without loss of social caste, but she never advocated "free" relations outside of marriage. Her revelations of feminine suffering profoundly influenced contemporary men authors, notably Henrik Ibsen and Jonas Lie. In several volumes of polemical essays and *causeries* (1862-85) she further laid bare the contempt for women exhibited not only in law and custom but even in literature, impugning such masters as Goethe, Byron, Dumas and Strindberg for their attitude toward women.

By breaking down inhibitions and opening horizons Camilla Collett prepared the way for the emancipation of women, which, after the movement had been started, was accomplished with great rapidity in all the Scandinavian countries. Gradually she came to realize that her ideal, liberation of women's hearts and souls, could not come to pass without first changing their whole status in the community. She lent her support to the efforts of younger

women looking toward specific reforms, such as admitting women to the university and the professions, allowing sisters to inherit equally with brothers, raising the level of women's wages and permitting married women to attain their majority and to dispose of their own earnings. All these reforms were achieved during her lifetime.

COLLINGS, JESSE (1831-1920), English land reformer. One of a group of zealous enthusiasts including Canon Girdlestone, Joseph Chamberlain, Joseph Arch, J. S. Mill and Russell Wallace, Collings was in the forefront of every movement which aimed at improving the life of the countryman. He was one of the founders of the National Agricultural Labourers' Union (1872), and did much in the early struggles of that organization to extend its activities in the field of social work and to dissociate it from the cruder aims of some of its leaders. After his election to the House of Commons he introduced legislation dealing with education, housing, allotments, credit and emigration, all of which figured in his program. As founder of the Rural Labourers' League (1888) he carried on a campaign for "three acres and a cow." Much that was attempted in the last quarter of the nineteenth century failed, but the passage of one generation saw most of his ideals achieved in a modified form. Collings was, indeed, ahead of his time and was regarded as a fanatical and dangerous radical. Although his views regarding land tenure were apt to be distorted by his misreading of history he showed restraint in eschewing the confiscatory policy aimed at by certain of his colleagues. This is borne out by his writings, e.g. *The Colonisation of Rural Britain* (2 vols., London 1914), and in his evidence before various royal commissions.

COLLINS, MICHAEL (1890-1922), Irish political leader. Collins' active participation in the Irish revolution was preceded by a period in London where his circle was Irish, his interests Irish nationalism and athletics. At this stage

he was the young enthusiast and radical and was soon sworn into the Irish Republican Brotherhood. In 1915 Collins and fifteen others left London, where conscription awaited them, to take part in the volunteer movement at home. Six of them were killed next year in the Easter Week rising, Michael Collins being afterwards picked up and deported to Frongoch. Among the several thousand prisoners in the Welsh internment camp he came to be felt as a magnetic and buoyant personality, and during the "German Plot" scare of 1917, when forty leaders were rearrested, he promptly shouldered national responsibility in volunteer and political field organization. The enthusiast was passing into the man of action. In the sweeping electoral victory of 1918 he was elected for County Cork. Sinn Féin declared the Irish Republic and the clash with British authority came everywhere, with wholesale suppression of nationalist societies. In 1919 Collins was minister of finance and head of the Intelligence Department of the army; as conflict became violent he dominated policy. He raised £400,000 as a national loan; by methods incisive and ruthless he made it undesirable for any Irishman to act as spy for the British. He identified and won over certain British secret service men. He created his own secret service, raided government mails, tapped telegraph and telephone, terrorized police, organized drastic reprisals, rescued De Valera and other prisoners and proved himself agile and unflinching in every detail of the struggle. By 1921 the British were offering £10,000 for him dead or alive, but his audacity and driving force were united with "clean and swift intellect." This did not fail him when he was brought into the open, against his will, as one of the chief negotiators of the treaty. From the signing of the treaty in December, 1921, to the Dáil elections of June, 1922, he bent all his energies to convincing the people that the treaty gave "the substance of freedom" (see his book, *The Path to Freedom*, Dublin 1922). The elections confirmed the Free State legally but did not quell opposition, and Collins faced the issue of civil war. Several attempts to ambush him failed. The sudden death of his admired associate, Arthur Griffith, August 10, 1922, made him head of the council as well as the army, but on August 22 he himself was shot dead in an ambush near Bandon in Cork. His valiant career thus ended when he was thirty-two years old. He was a born politician, strongly democratic and advanced, vigorously

critical of Irish backwardness, a believer in Gaelic Ireland and not a little emancipated by eight years' residence in London. He did more, probably, than any other single man to bring the Irish Free State into actual being.

(London 1926); Dalton, Charles, *With the Dublin Brigade (1917-1921)* (London 1920); O'Connor, Batt, *With Michael Collins in the Fight for Irish Independence* (London 1929); Breen, Daniel, *My Fight for Irish Freedom* (Dublin 1924).

COLMEIRO, MANUEL (1818-94), Spanish jurist and economist. In 1847 he was appointed to the chair of economics and administrative law at the University of Madrid, where he taught until his retirement in 1881. In that year he was made a life member of the senate, in which he had already served several terms. He was an active member of various learned societies, including the Real Academia de Ciencias Morales y Políticas, and was a frequent contributor to periodicals.

Although Colmeiro is of limited importance as a theorist his historical writings are extremely significant. His principal theoretical works are *Elementos del derecho político y administrativo de España* (Madrid 1858, 7th ed. 1887) and *Principios de economía política* (Madrid 1859, 4th ed. 1873), in the latter of which he abandoned the doctrine of protection in favor of free trade. Among his historical works the *Cortes de los antiguos reinos de León y de Castilla* (2 vols., Madrid 1883-84) is particularly noteworthy by reason of its valuable data of an economic and financial character assembled with a view to explaining the structural changes which the state was undergoing. His *Derecho administrativo español* (2 vols., Madrid 1850; 4th ed. 1876) is likewise important for its historical studies of Spanish institutions. In the *Historia de la economía política en España* (2 vols., Madrid 1863) he traces in a somewhat superficial manner the economic evolution of Spain to the beginning of the nineteenth century, bringing out the relations between theories, actual conditions and institutions. Although the book marked an advance over previous works and although it is still the only complete work on the subject its documentation is antiquated and the author's lack of scientific method is obvious. His *Biblioteca de los economistas españoles de los siglos XVI, XVII y XVIII* (Madrid 1880, a revised edition of the article in

R. Academia de Ciencias Morales y Políticas, *Memorias*, vol. i, 1861, p. 33-212) is an excellent reference work.

FERNANDO DE LOS RÍOS

COLONATE. The colonate as a form of servile land tenure was prevalent throughout the later Roman Empire. Agricultural land in Italy and the provinces was to a very large extent divided into estates of tremendous size (*latifundia*) owned by either great proprietors or the crown. Some of the land was worked by slaves but most of it by small tenant farmers called *coloni*. The latter constituted a close, hereditary caste and are of interest, among other reasons, as one source of the mediaeval institution of serfdom.

Legally the *coloni* were freemen. They could own either personal property or land, contract legal marriages, appear in court and, provided that substitutes could be obtained for their tenancies, be drafted into the army or become priests. They marketed their produce themselves and paid a fixed rent, usually in kind, which the landlord might not under any circumstances increase. They were subject to the imperial poll tax, which was collected by the landlord, and also owed the state certain annual services, such as the maintenance of roads and bridges and the construction and repair of public buildings, as well as carrying services with wagons and oxen or packhorses. Since services to the landlord are mentioned in the codes (*Cod. Just.* xi, 53, 1, 1) only once and vaguely, it is not known how onerous they were. Certainly it is not likely that the *coloni* were subject to as heavy burdens in "week work" and "boon days" as the mediaeval serfs.

The outstanding characteristic of the *coloni* was the fact that they were permanently attached to the estates on which they were born. The landlord could not free them from their condition as he could manumit slaves, nor sell his estate without the *coloni* which belonged to it. They were "slaves of the land itself on which they were born" (*Cod. Just.* xi, 52, 1, 1).

There is absolutely no evidence that the *coloni* were bound to the soil in Italy or the provinces before the fourth century, and as late as 244 A.D. proprietors were forbidden to retain tenants on their estates against their will (*Cod. Just.* iv, 65, 11). The first law referring to *coloni* attached to the soil was a rescript of Constantine in 332 A.D. (*Cod. Theod.* v, 17, 1), a regulation governing the punishment of *coloni* who attempted to leave their holdings. Sometime, therefore, between

244 and 332 the colonate was established. As neither the laws of the codes nor the writings of contemporaries, in so far as they have been preserved, give any explanation of the origin of the colonate it has remained one of the most baffling problems in economic history. Although every source of information has been examined with the most meticulous care by numerous able scholars and many ingenious theories have been presented, the material is so scanty that no theory of the origin of the colonate has been generally accepted.

It is possible to classify the theories of the colonate into six main groups. The colonate has been derived from: a voluntary enlistment of freemen oppressed by taxes and debts; a limited manumission of slaves which bound the freedmen to the soil; enforced settlements of barbarian tribes within the empire as serfs; a gradual evolution from earlier servile tenures or dependent relationships; the attempt of the administration to prevent the desertion of agricultural land in order to maintain the food crops and the land tax; and the declining fertility of the soil, which is held to be the underlying cause necessitating the strenuous efforts of the administration to keep the land under cultivation by force.

Modern scholars do not regard the first three theories as very convincing. That small proprietors occasionally entered the colonate after it had been established is well known. But there is no evidence that the colonate was originally organized as a voluntary institution; and such an explanation runs counter to the whole general tenor of the colonate legislation of the codes. The second theory, likewise, suffers from the lack of a single supporting text. The theory of barbarian settlements was advocated by a number of writers during the first half of the nineteenth century. It is true that barbarian tribes were settled on agricultural land within the empire from the time of Augustus. But no classical reference indicates that the transplanted barbarians cultivated the soil in a tenure anything like the colonate before the fifth century. And it seems extremely unlikely that the barbarian settlements, which were for the most part near the northern frontier, could have had a determining influence on the agrarian development of the whole empire.

Many scholars have attempted to explain the colonate as a slow and natural evolution from early servile and dependent tenures which had been in existence in Mediterranean countries in

many cases long before the Roman conquest. The colonate has been related to Greek serfs, to Italian and Gallic clients, to Italian debtor tenants, to tenants on the imperial domains and to state peasants in Sicily, Africa and the eastern provinces. The attempt to trace a relationship between the colonate and the early Greek serfs or the Italian or Gallic clients was too far fetched to receive much consideration. But the theory that the colonate emerged gradually from natural developments on the imperial domains and private latifundia, particularly in the great grain provinces of Sicily, Africa and Egypt, has attracted considerable support. Here there had existed for centuries dependent cultivators who seldom thought of moving from their native villages; in Egypt and other eastern provinces they were not allowed to leave their native tax districts. It is thought that the colonate legislation was simply the final step in an attempt to make universal throughout the empire conditions which had created a settled peasant class in the great grain provinces.

The theory of administrative pressure lays more emphasis on the chaotic conditions in the late empire than upon the dependent status of the agricultural population in earlier centuries. The half century of anarchy which preceded the reign of Diocletian led to a general demoralization of agriculture throughout the empire. Land was being deserted everywhere and the land tax fell off alarmingly. Diocletian reorganized the system of the collection of taxes, making the municipal magistrates (*decuriones*) responsible. Writers upholding this theory argue that, in order to make it possible for the magistrates to collect the taxes and to assure a regular flow of food to the cities, it became necessary to attach the coloni to their holdings by force.

The newest theory of the colonate ascribes the colonate legislation to the declining fertility of land throughout the empire. Land in Italy commenced to be deserted during the republic and numerous contemporary writers lamented its diminishing yield. And while the productive areas were diminishing, the demand for food-stuffs increased steadily with the development of the empire and the imperial city. No empire ever supported so many economically unproductive classes as Rome—legions, a vast army of official functionaries, luxurious urban bourgeoisie, turbulent city mobs. The requirements of these classes had to be supplied through tribute levied upon the provinces. But eventually even the fertile provincial lands com-

menced to show the effects of the constant cropping of the land with wheat. As early as the second century desertion of the fields became a serious problem in Africa, and in the next century *agri deserti* were to be found in all parts of the empire, except in the ever flooded Nile valley. To keep up and restore land cultivation in the grain provinces the administration offered peasants tax rebates and hereditary rights in reclaimed land, while large contractors (*conductores*) enjoyed the favorable terms of the emphyteutic lease. In the northern provinces barbarians were settled on the land "on account of the scarcity of grain" (*Cod. Theod.* v, 6, 3). In the third century came the *ἐπιβολή* legislation forcing the proprietors and large contractors to keep unproductive lands in cultivation and pay taxes on them. And finally, according to the claims of writers of this school, in order to check the constant desertion of the tenant farmers they were attached to the soil in the permanent and hereditary bonds of the colonate.

Whatever the origin of the colonate may have been all writers agree that it proved well adapted to the times. Century after century it persisted with very little change. When the barbarians overran the Roman Empire in the West they had no thought of abolishing a system upon which the maintenance of food supplies depended and which did not differ greatly in essentials from the primitive servile land tenures to which they had long been accustomed. The laws in the barbarian codes referring to coloni are closely analogous to the earlier Roman laws in the Theodosian and Justinian codes. With the development of feudalism, however, the coloni found themselves more and more at the mercy of their lords. Although distinguished from the serfs and regarded as *ingenui* in the eyes of the law as late as the ninth century, the coloni eventually were absorbed in the servile population of the mediaeval manors.

COLONIAL ADMINISTRATION. The art and practise of colonial government have been known to all the great states of the past; but the last two centuries have brought about the development of colonial administration as a major branch of governmental technique and a major phase of national policy.

The essence of earlier methods of colonial administration is to be sought in particular motives for colonization and particular colonial commercial policies. In colonies resulting from migration and expansion there has usually been a rapid transition from military government to assimilation to the governmental regime of the expanding empire (*see* EMPIRE). A similar transition may occur in the case of territory conquered for military or fiscal purposes. Trading colonies, on the other hand, have usually remained small autonomous units, distinct groups in the midst of an alien civilization, such as the mediaeval settlements in the Levant or outpost cities in rural lands, like many of the Greek colonies; and either they have been administered by agents of the commercial groups who sent them out or they have been self-governing according to the model of the home state.

The great modern period of colonization began as an intensification of commercial exploration and developed under the inspiration of the mercantilist philosophy. This philosophy was reflected in the administration of the lands conquered, administration first by military leaders and in the case of the Catholic countries by missionaries; later by civil representatives of the crown with plenipotentiary powers. In any case, the administration was designed to bring the greatest possible wealth to the home government. The colonial administration of Spain and Portugal remained essentially of this military-autocratic character. Increasingly elaborate councils and boards for the control of fiscal and commercial monopolies were set up within the countries themselves (*see* AUDIENCIA; ASIENITO), and a degree of consistency was given to colonial policy by the important Council of the Indies (*q.v.*); but in the New World governments and royal agents were in effect free to decide for themselves on methods of handling

the natives or of protecting their territory, provided they sent back the expected amounts of revenue. The antagonisms aroused by the resultant maladministration played no small part in the dissolution of Spain's colonial empire.

While the breaking of the Spanish power was accomplished by rival governments and while governmental encouragement undoubtedly played a large part in the subsequent expansion, the important agencies of colonization in the seventeenth and eighteenth centuries were the great private trading companies, especially the chartered companies (*q.v.*). Setting out from Holland, France or England to establish trading depots in distant places these companies had, guaranteed by their charters, virtual freedom of action in the administration of colonies which they might establish. Relations with the natives, legislation and defense were all in the hands of the agents of the company.

It was the intensification of national colonial rivalries at the end of the eighteenth century which led to the taking over of responsibility for colonial affairs by the European governments themselves and thus brought colonial administration into the realm of national policy. The Napoleonic wars left England with a vast colonial empire, which she had learned to value the more for the loss of the American colonies; and the industrial revolution, by making Indian cotton more important than Indian spices and by preparing the way for a new commercial philosophy, gave impetus to the trend toward governmental assumption of full responsibility for colonial administration. It was not until 1858 that the East India Company was finally liquidated and its functions taken over by the British government; but all the newly acquired territories immediately became crown colonies administered by royal agents, the governor or governor general.

The early government system of administration differed little from that of the commercial companies which it succeeded; for the agent general of the company was substituted the governor, representative of the crown, with practically plenipotentiary powers. In other cases military government gave way to civil. But as the relations between colony and home government became more settled and acquired more apparent permanence an elaboration of administrative machinery occurred. Whether or not the example of the American Revolution influenced the direction of this development, it is true that in the English colonies this

elaboration took the form of the gradual setting up within the colonies of organs of representative government. Certainly the whole mid-nineteenth century pressure toward democratic ideals manifested its force in this realm.

The first step in this direction was the passage in 1791 of the Constitutional Act of Canada setting up a bicameral legislature, the upper chamber of which, the Legislative Council, was appointed by the crown, while the lower, the Assembly, was elected by the people. It was not until 1847 that Canada obtained an effective degree of self-government; but this early constitution became a model for the other colonies, particularly those settlement colonies in which the majority of the population were of European, if not English, origin. In other types of colonies the introduction of a degree of self-government has been much more gradual. Different as has been the history of individual colonies, the general pattern of development is clear: first the nomination by the governor of an advisory council composed of natives of the colony; then the selection of certain members of this council by representative groups of natives; the creation of an elective lower chamber with little or no real power and its gradual endowment with responsibility in designated spheres. It is a pattern which leads logically, if not always in actuality, to full dominion status (*q.v.*).

It was not, however, until the development of modern methods of transportation and communication toward the end of the nineteenth century that colonial administration became of vital national concern. Up to that time governments had half unconsciously continued to look upon colonies as trading outposts or pawns in a strategic game; their internal affairs were of moment only to the extent that they forced attention. But this attitude was quickly changed when the investment of capital on a large scale in the colonies made necessary the maintenance of order and the guaranty of economic stability. French expansion under the Third Republic, the partition of Africa, the acquisition of the Philippines, were all the result of state activity and all involved an eventual extension of the scope of administrative control. The tradition of the granting of at least a minimum of local self-government has been strong enough to result in the establishment of some form of representation in most of these colonies. The form of colonial government reflects quite clearly the mold of the home government. English colonies have the bicameral parliamentary system;

French colonial administration follows the traditions of centralization. The aim of French colonial policy since the revolution has been complete assimilation, and self-government for a French colony takes the form of admission to the status of a local governmental unit.

Concurrently with this elaboration of governmental machinery within the colonies there has been a vast extension of colonial administrative machinery in the home government. Most of the important colonial powers now have departments of colonial affairs, many of which have evolved over a long period of years. In England the first attempt at centralized administration of colonial affairs was made in 1660 when a Committee of the Privy Council "for the Plantations" was appointed; this body afterwards became merged with the Council for Trade. It was not until 1854 and as a result of the Crimean War that a secretary of state for the colonies was appointed. In France the appointment of a special minister for the colonies resulted from the great expansion under the Third Republic. In both countries the office has since been enlarged and its functions expanded. In England new developments in dominion status and policy led to a further reorganization of the department in 1925. Among important colonial powers the United States alone has no department of colonial affairs, the administration of its outlying possessions being distributed among the bureaus of three separate departments. The Philippines, Panama Canal Zone and Porto Rico are administered mainly through the Bureau of Insular Affairs of the Department of War; Guam, Tutuila and the Virgin Islands through the Department of the Navy; while Alaska and Hawaii, sole survivors of the old fashioned "territory," are under the aegis of the Department of the Interior.

It is the colonial bureau which coordinates the entire colonial policy of a country, supervises the administrative officials, watches over colonial finances and in general exercises the authority theoretically residing in crown and parliament or assembly. These officials, together with the larger number of administrative officers in the colonies, constitute one of the most important of modern governmental groups. Premonitory recognition of this fact and the pressure of the necessity to build up an adequate and trained group of colonial officials have led most countries to the adoption of some form of the merit system for the selection of their colonial personnel. The British officials in

India have been chosen by that system since about the middle of the nineteenth century; it has been used by France in Cochin China since 1863 and in the Dutch colonies since 1864. A civil service act for the Philippines was one of the earliest legislative products of the United States commission functioning there.

But civil service boards, however carefully administered, can examine only those who present themselves; and such candidates, although able to pass examinations in the prescribed subjects, frequently lack the background and outlook essential to success in colonial administration. Recognition of this fact has led in several countries to the establishment of colonial schools. As early as 1800, under the direction of the East India Company, such a school was founded at Fort William, Calcutta; six years later another, the East India College, was established at Haileybury near London, but was closed in 1858. In 1864 the Dutch government founded a similar school at Leyden and afterward another at Batavia, Java. Before the end of the nineteenth century a colonial school at Paris came under the control of the French government. All of these schools have provided specialized instruction along lines most serviceable to the colonial administrator, such as the study of local languages. The result has been the gradual creation in those countries of a class of colonial servants who approach their tasks with a systematic preparation comparable to that of any other professional group. The colonial services of most European states now consist largely of those who make their careers in that field. This is in striking contrast to the situation in the United States, where few are found who even aspire to such a career—a situation due not alone to lack of colonial schools but also to uncertainty of tenure of colonial office. For the lack of a settled colonial policy immune from the exigencies of partisan politics makes it impossible for the United States government to offer its colonial servants permanent careers.

Some of the most pressing problems of colonial administration center around the utilization of native personnel in executive positions within the colonies. In most cases the growth of an established machinery of administration has been followed by the use of natives in an increasing number of governmental positions. Where there is a large territory to be guarded they must be counted upon to make up the bulk of the army and of the police force. This

is notably true in India. In many cases they are indispensable in local governmental positions or the lower administrative posts, where direct and understanding contact with the mass of the population is essential. Wherever eventual self-government or assimilation has become a fixed policy the training of native teachers, judges and administrators is a natural step. Such a development will generally proceed more rapidly, the greater the degree of immediate legislative control of internal matters the colony may have achieved; it is likely to reflect somewhat too the extent of extragovernmental induction into such fields as education and law which native groups have achieved. The United States has proceeded somewhat more rapidly than most countries in "nativizing" its colonial civil service; the Philippine civil service at the present time consists almost entirely of natives. Such a policy presents, from the point of view of ardent supporters of the home government, dangers of a too rapid loosening of control over the colony. With a less extensive use of natives there are dangers of racial friction within the service. Probably no governed group has been satisfied with the methods of utilization of native personnel. The home government is charged either with building up a class loyal to itself rather than training for complete independence or with favoritism and discrimination.

Many countries have made most conspicuous use of colonials in the army and police force. Thus in India the native troops are about twice as numerous as the British and in the Dutch colonies the ratio is about three to two. France has endeavored to utilize her colonial population for this purpose, forming groups of colonies under a single commandant, concentrating forces at strategic points and reducing garrisons elsewhere. The American government at an early period in its administration of the Philippines organized the Philippine Scouts as a part of its army. Such native troops are always officered by nationals of the home government. Their use is necessary, but the question of their loyalty in time of crisis sometimes presents to colonial powers a problem of great potential difficulty.

The introduction of a degree of local self-government in most colonies has limited but slightly the scope of colonial administration. Except in the British dominions questions of peace and war and relations with other countries are settled by the home government; in some cases colonies may contract treaties, but

only by consent of the governing country. Problems of defense are strictly controlled by the home government. One of the first claims of the English colonies was for greater freedom in matters of taxation. Such freedom the dominions have achieved, but for most countries fiscal control remains one of the most important phases of colonial administration. Ancient colonies were generally valued for the tribute they paid, but modern ones are not usually expected to be more than self-supporting. Indeed, France and Germany long contributed to the expenses of their colonies. One favored exception is the Netherlands, which for at least a century has drawn extensive revenues from its East Indian possessions. British crown colonies and India are generally required to pay the expenses of the imperial forces garrisoned in their midst. No such charge is made by the American government in the Philippines or Porto Rico, but with this exception both are practically self-supporting.

It has frequently happened that an existing tax system has been taken over intact by the colonizing country, old land taxes or head taxes continuing to be collected in the accustomed manner by tax farmers. Monopolies, on such goods as opium, salt or camphor, have long afforded a favorite form of colonial taxation. With the general development of methods of taxation within the last century many of the new forms have been applied in the colonies. Export and consumption taxes and, more recently, income taxes are common. A new importance has been given to colonial fiscal administration, as to all other phases of colonial policy, by the growing importance of tropical colonies. To make such territory habitable and usable the construction of roads and railroads or the clearing of swamps and forests is usually necessary. Such engineering activity has commonly been undertaken by the home government partly through the use of forced labor, partly through loans to the colony, which are then made charges on its budget. Most colonies are now fairly heavily in debt to their home governments.

As a result, even where colonial legislatures exist and have power to vote fiscal measures the home government ordinarily retains the power of vetoing and of supervising the budget. The budgets of British crown colonies, for instance, are first submitted to the fiscal branch of the Colonial Office and finally undergo the scrutiny of the Treasury. Similarly in France all

fiscal matters are submitted to a central bureau.

The increasing commercial importance of colonies has led to an almost equally close control of colonial commercial policy. Customs duties not only form an important source of income but affect the tariff policy of the entire empire. Most countries control the fixing of such duties. Concessions are usually granted by the home government, while in some cases attempts have been made to monopolize the supplies of raw materials.

Almost equally wide is the scope of the activities of the colonial administrator within the colony itself. In one sphere most governments have left their colonies considerable local autonomy—in the determination of the legal system to be followed. A primary step in the establishment of any settled civil government is the setting up of a judicial system. This branch of government was ordinarily the first to be separated from the prerogatives of the governor, and it has in most cases remained subject to control, if at all, by the judicial and legislative branch of the home government, not by administrative officials.

The first question for the dominant state to determine in connection with the administration of justice is, what law shall be applied? The Romans generally let the inhabitants of conquered lands retain their native laws, gradually building up and applying a *jus gentium* for cases of more than local scope. The barbarian conquerors followed the same practise, which from general custom became the recognized doctrine of international law. The British policy in acquiring territory occupied by an alien race has been to leave private law undisturbed. Thus the custom of Normandy was left in the Channel Islands and the custom of Paris in Quebec under the act of 1774; Roman Dutch law still remains to a large extent throughout the Union of South Africa, British Guiana and Ceylon; Italian (Sicilian) law in Malta; and as personal systems Moslem law in the Hanafite form in India and Burma and in the Malikite form in Nigeria and other colonies; Buddhist law in Burma and Hindu law in India. From the beginning native law has applied only to the native population, nationals of the home government being judged in their own courts by their own law (*see* CAPITULATIONS; EXTERRITORIALITY). Moreover, while native civil law has been respected, the criminal law of the dominant state has almost always been introduced immediately. Many of the sys-

tems of native law have not contained rules governing important phases of modern life, nor has their interpretation by a group trained in alien traditions facilitated their adaptation to novel situations. There has therefore been a tendency for their gradual displacement by legislation based on the concepts of European law. In India such important subjects as family law and succession are still governed by the various personal systems, but in most colonies the applicability of native law is gradually being restricted to religious or family arrangements intimately bound up with native customs, while economic relationships and the regulation of crime or of the public welfare are gradually being drawn under the legal system of the home government.

But not all nations have even pretended to follow the Roman practise. Spain's viceroys and the Council of the Indies gradually enacted legislation which by 1530 had virtually displaced native and had substituted Spanish law, not only in the vast colonial empire of the three Americas but also in the Philippines. In Algeria, Tunis, Indo-China and other colonies French law was first introduced for Europeans, while the natives continued to be governed by their own; but the former has been encroaching upon the sphere of native law with increasing rapidity; in Algeria native law has practically disappeared. The American policy in this regard has resembled the French rather than the British. The Spanish-Mexican law was rapidly displaced by the American in Texas, California and New Mexico. Even Louisiana retains little Spanish or French law except in the civil code, while Russian law in Alaska seems to have been ignored from the beginning of American sovereignty. In the Philippines and Porto Rico a different policy was announced but only partially followed. All the remedial and most of the public law has been supplanted by American-inspired legislation. In Porto Rico the Spanish penal code, a highly scientific instrument, was repealed to make room for one modeled on the criminal code of an American state, whose framers made no pretensions of knowing comparative law or the special requirements of Porto Rico. In neither jurisdiction was the Spanish civil code expressly repealed; but in the Philippines the new Code of Civil Procedure contains so many provisions relating to subjects covered by the civil code that the latter, as construed by the Supreme Court, was by implication repealed *pro tanto* in features

of great importance and was therefore left in a mutilated and incomplete condition.

If the choice and framing of colonial law raise perplexing problems, much more so are those raised by its administration. The personnel of the judiciary, its character and selection, the proportion of the native element, the extent of appellate jurisdiction and the interpretation of native law by alien judges and distant tribunals must all be considered. In every colony it is the primary courts, under whatever name, which more often than any other touch the bulk of the population. Here the government is confronted with the complicated problem of personnel in an acute form. Shall it select native magistrates, familiar with local dialects and customs and willing to accept relatively small remuneration but subject to prejudices, factionalism and, too often, questionable practises? Or shall it appoint its own nationals, lacking familiarity with local customs, with a different group of prejudices but with the viewpoint of the governing country, to perform an ostensibly petty but really fundamental task?

The question of personnel becomes acute also in the intermediate and appellate courts of the colony, where again thorough knowledge of the local law is indispensable. In 1801 Sir George Cornwall Lewis complained that the judges of India were obliged to consult the native pundits regarding Hindu and Moslem law. Only too common are situations like that in the Philippines, where out of nearly twenty Americans appointed from time to time to the Supreme Court barely a half dozen had previously given serious attention to the Spanish or any other form of civil law which they were to administer. Naturally they fell back on the use of American law and handed down decisions which deranged and upset the established system. Such evils are aggravated when the highest local tribunal is subject to review by another in the dominant country, whose judges make no pretense of familiarity with the local law or conditions. Since its organization in 1833 the Judicial Committee of the Privy Council of Great Britain has been hearing appeals from the colonies; complaints are still heard of the lack of understanding of native conditions evidenced by some of its decisions. It has long been felt that if more members of the United States Supreme Court knew Spanish law and local conditions it might not have arrived at certain decisions which have seriously crippled the administration of justice in the Philippines. In decided

contrast is the policy of the French Cour de Cassation, which does not undertake to hear appeals involving Moslem law.

Such contacts of legal systems are but one of the most striking forms of the meeting of cultures which leads to most of the modern problems of internal colonial administration. It is in the colonies of the tropics that those problems have been accentuated and have found most conspicuous expression. For here the very environment must be reshaped to make the country habitable for white men. One of the most important phases of colonial administration consists in public health work and sanitary control, made possible through the rapid development of tropical medicine (*q.v.*). But efforts to check smallpox or cholera or leprosy, involving compulsory vaccination or segregation, often arouse native hostility, and their continuance is for a long period dependent on the control exercised by the home government.

The education of the native population has been another rather general goal of twentieth century colonial administration. Schools and colleges established by missionaries have been encouraged and supported, and often government schools have been established on a large scale. Too often the conception of education is completely literary and shows little awareness of the values of the native culture. The American attempt not only to make the Filipinos literate but to give them the rudiments of an industrial training is an exception. Whatever may be said for the policy of education of a native population, it is certainly one of the most effective instruments of westernization.

The supplanting of native cultures is proceeding also through the forcible elimination of native practises. The attempt of the British Government to abolish suttee—widow burning—and infanticide in India is well known. Perhaps of even greater cultural importance has been the introduction of opium and alcohol by European governments into their colonies. The introduction of wage systems or the use of forced labor, by destroying the economic foundation of native society, is not only transforming native culture but producing new administrative problems. One of the major tasks confronting the colonial administrator today is the creation of a sane native policy (*q.v.*). As world economic relationships become closer the social systems and methods of exploitation of the great tropical colonies will affect more intimately the economic and political development of other

countries. Whether or not nationalism or communism takes root in such colonies, their administration seems likely to present increasing difficulties. Colonial administration will probably continue to be a major branch of government for some years, but the conditions under which it operates and the assumptions on which it is based can no longer be taken for granted but must meet the challenges of new groups and new social philosophies.

COLONIAL, COMMERCIAL POLICY. *See* COLONIAL ECONOMIC POLICY.

COLONIAL ECONOMIC POLICY. Approximately half of the world's land area consists of territories owned or controlled by a limited number of world powers, most of whose metropolitan areas are comparatively small. The controlled territories, with a few major exceptions, have economies almost totally different from those of the home areas of the colonial powers. Trade with colonies thus becomes important by virtue not only of its proportion to total world trade but also because of its essential nature as a necessary complement to the economies of the industrially advanced nations. By the same token the policies which govern the economic development of these colonies and their relationship to the mother country and other states assume great significance in the modern world economic order.

In Mediterranean and western world history the Phoenicians were the first great merchants

and navigators. They founded important colonies and utilized them as centers of activity for their merchants. Later the Greek colonies, although they were essentially agricultural, also served as trading centers for Greek merchants. In the main no special treatment was accorded them. There were occasions, however, when legislation affected them. Thus during the Peloponnesian War the 2 percent Athenian import tariff was raised to 5 percent on goods from the tributary Athenian colonies. In this way it was hoped to recoup the revenue lost through the refusal of the colonies to continue the payment of tribute. Rome stressed commerce less, but its colonies were forced to pay tribute in the form of shipments of grain to feed the Roman population. With the commercial and industrial revolutions the era of modern colonization began. The industrial revolution brought a greater territorial division of labor and a concentration of manufacture in England and western Europe with a corresponding dependence upon outlying areas as sources of materials and markets for finished products. The systems of colonial control set up were primarily, though not exclusively, motivated by economic factors. At first trade may have "followed the flag," but even then the economic objective was often present; latterly, contrary to popular notion, the flag has often followed trade.

The development of modern colonial policy may be traced through three main periods. From the latter half of the fifteenth century to the end of the Napoleonic wars the Portuguese and Spanish, the Dutch and the French and English were successively the most effective nations in exploration, discovery and colonization. Their methods varied, but the entire period is characterized by the predominance of exploitation as the policy of the mother country toward the colony. This at first took the form of an attempt to obtain from the colonies their reputed fabulous stores of the precious metals. The general disappointment in this hope brought with it a policy of exploiting the natural productive advantages of the colony for the benefit of the mother country. It was the varying ability of these countries to adopt the policy of developing basic productive opportunities which largely accounted for the waning of Portuguese and Spanish influence, the Dutch successes, the rise of France as a colonial power and the final supremacy of Great Britain in building the greatest colonial empire of modern times. This process of exploitation, known as the colonial

system, formed a part of the mercantilist system of economic legislation. It was based upon the principle that the function of the colonies was to provide a source of raw materials and a market for finished products for the mother country. Accordingly, the development of industry in the colonies was discouraged; trade was monopolized by the government, a chartered company or the nationals of the mother country and the colony; and the use of ships owned by nationals of other countries was either forbidden or discouraged. Severe penalties were assessed for violations of the restrictive acts. Discontent with this system led to the breaking away of important colonies, as in the American Revolution, and a consequent doubt as to the ultimate wisdom of the policy.

Gradually the system was relaxed, and at the close of the Congress of Vienna a policy of moderation toward colonies prevailed. The growth of commercial treaties was the instrument through which the change was accomplished, but the basic reason back of the change was a realization that exploiting measures did not pay. This attitude was supported by a general liberal anti-absolutist movement in western civilization which affected not only economic affairs but also religion, literature and politics. It found expression in the American and French revolutions and notably in the capitulation of mercantilism to the economic philosophy of *laissez faire*. The movement in England culminated in almost complete free trade by 1850.

After the middle of the nineteenth century there was a remarkable revival of colonial expansion. New explorations in Africa created colonies and spheres of influence there. British holdings in Asia, Africa and Oceania became approximately four times as great as before and French holdings sixteen times as great. Germany, Belgium, Italy, Japan and the United States took their places among the colonial powers. This expansion was largely a result of the further growth of industrialism and of a consequently keener competition for markets. Trade with colonies became increasingly important. While recent official composite estimates are not available, just before the World War the colonies had nearly one fifth of all world trade, the total trade of colonial powers was three fifths and the total trade of empires over three fourths of total world trade. The importance of colonial trade for the mother countries varies considerably, but according to the same estimates it ranged from approximately 35 per-

cent of the total trade in the case of Great Britain to less than 1 percent for Germany and Italy. The United States, with a colonial trade that amounts to only a small percentage of its total trade, depends upon the colonies of other powers to a great extent for the supply of strategic commodities and to some extent for market outlets.

Colonial import tariff systems are of three general types: assimilation, or the extension of a single tariff wall around colonies and mother country; preference, or lower rates for goods traveling within the empire; and the open door, or equal treatment for all nations, the relation of colonies and mother country in this case being that of separate nations. With the rise of the new colonial systems came a revival of restrictions on colonial trade, associated with the decline of *laissez faire* and the advent of modern protectionism in a number of leading countries. A policy of neomercantilism, more refined and indirect than the old colonial system and revolving principally about discriminatory differentials in tariffs and shipping, has characterized colonial economic policy since 1875.

Treaties between colonial powers have checked to some extent the spread of the discriminatory system. Open door treaties have often covered tariff and other relations with colonies. Rate limiting treaties have fixed maximum, minimum or uniform tariff rates for two or more colonies. General commercial treaties, which before the war usually contained the most-favored-nation clause, have sometimes given preference to colonies, although they have usually provided opportunities for future preference by excepting the colonies. The newer British commercial treaties, however, including most-favored-nation agreements, for the most part specifically include the crown colonies; the dominions may ratify them if they wish. Certain French colonies are now governed in part by conventional rates applying equally to products from France and other nations party to the conventions. This is rather inconsistent with the French general policy of colonial tariff assimilation. The new post-war commercial treaty structure shows little tendency to change these arrangements. With reference to the mandates, classes A and B provide open doors for League members only, class C for none; the result of Iraq independence remains to be seen. In general, intercolonial trade is the same as trade with the mother country, especially among the French colonies. In the British Empire, however, and particu-

larly among the dominions and the British West Indies, preference does not automatically apply to all colonies, although special agreements have provided extensions or interchange of preference.

Nations vary considerably in the extent to which they use the system of tariff discrimination. The Netherlands, Belgium and Germany have generally followed the open door policy, with moderate tariffs. Italy uses the preferential system to a large extent, and Spain and Portugal have, in the main, continued their preferential systems. France in 1892 adopted assimilation as its general policy, although it still has preferential and open door areas. Japan adopted assimilation in 1909 for Formosa and Karafuto and in 1920 for Korea, but Kwangtung leased territory is nominally an open door area. The United States employs the open door system in Samoa and the Canal Zone, assimilation in Porto Rico and preference in the Philippines, Virgin Islands and Guam.

While the British Empire also exhibits all three of the types, preference is widely found. From 1860 to 1919 Great Britain maintained the open door in India and in most crown colonies, with either free trade or low revenue tariffs. Hongkong and Singapore are often listed as open door ports, but they are more accurately indicated as free trade ports, since as great entrepôts and trans-shipment centers the erection of any considerable tariff wall would defeat its own purpose. After 1919, as a reaction to post-war nationalism, empire preference increased, although the open door is still maintained in places. The position of the four great self-governing dominions, Canada, Australia, New Zealand and South Africa, presents a peculiar problem. These dominions, having received fiscal autonomy, long since began to build their own tariff walls, sometimes extending high rates even to mother country products. The Union of South Africa and the Irish Free State have a double schedule, with the minimum applying to imports from the United Kingdom. New Zealand also has a maximum and minimum schedule, with a few special treaty rates. But Canada and Australia have a special form of multiple tariff schedule giving the mother country some preference. Their three-level schedule, maximum, intermediate and minimum, allows entry of mother country products at minimum, really a sort of subminimum. Most-favored-nations send goods in at the intermediate level and the maximum applies to all others. Even with this special device Great Britain has often

felt she was not receiving generous treatment there. Conversely, when Great Britain after the World War partly abandoned its traditional free trade policy and adopted a certain amount of protection, some preference for the dominions was allowed. The Imperial Economic Conference of 1923 brought a renewed demand for mother country preference to dominion products, and the tariff act of 1926 extended the existing preference, in the tariff on key industries, for ten years. Meanwhile the imperial conference of 1926 gave to the dominions politically almost the status of independent nations. There is now a renewal of the older Chamberlain idea of empire free trade, a scheme which would create a tariff wall around the entire empire, including the United Kingdom, with free trade simply among the parts. It is hoped that this may revive some of the waning imperial economic unity. The 1930 Canadian Tariff Act, however, is an indication that there are forces working in the opposite direction.

The proportion of preference granted by the several tariff policies varies widely. It is often a reduction of two fifths or less on the regular rate. In the dominions it ranges from one fifth to one third or one half, although there are non-preferential exceptions in the preferential system. On the basis of percentage of reductions granted, the United States and Japan rank first, followed by Portugal, France, Italy, Spain, the British dominions and the British crown colonies. Assimilation does not always equal 100 percent preference, since exceptions and minor charges may reduce the differential to 80 or even 50 percent. Various minor and indirect types of preference may be effectively used. These include open discrimination in minor duties and fees, discriminatory classifications, concealed discriminations through administrative discretion in valuation, enforcement of merchandise marks acts and similar devices. The total general effect of preference, furthermore, must be judged with reference to the total volume and value of trade and, especially, the commodity significance of the trade. British preferentials consequently attract more attention than their percentage of reduction would seem to justify.

Prior to the World War export duties had nearly disappeared from the European tariff structure but they continued to be of importance in colonial policy. Their rates were lower than import duties, since their purpose was primarily fiscal, rarely protective and preferential. Such duties permit the colonies to share

in the profits of the exploitation of their resources. The sliding scale export duty on rubber under the British-Malayan-Stevenson plan was not preferential but was arranged for price valorization. The United States, as the world's chief buyer of rubber and seller of tires, was placed at a temporary disadvantage as a result of it. Preferential export duties have been used increasingly, as in the British Empire during the period of post-war nationalism. Some incidents of export preference have been noteworthy. The preferential duties on tin from British Malay affected chiefly the United States. The former preferential duty on hides and skins from India was one third of the 15 percent duty, although both rates and preference have usually been lower. Here the avowed purpose was to protect Indian tanning industries, but some American shoe manufacturers felt that an attempt was being made to force them to move their plants to Canada, within the preferential circle. On the whole, export duties, though more important than in mother countries, have not been widely used in colonial tariffs.

Under modern neomercantilism, assimilation and preference work almost exclusively to the benefit of the mother country. Metropolitan tariffs are designed primarily to protect the home market; assimilation under such tariffs protects the colonial market for home products. The products of the colonies, however, generally different from those of the home country, gain practically nothing from assimilation. Similarly, preference ordinarily helps the colonies little, for the colonial products, chiefly otherwise unobtainable raw materials and staples and sometimes distinctive foodstuffs, are usually admitted to the mother country free or with a low duty. Differentials may exist, however, in competitive cases, as in tobacco and sugar (for example, Philippine sugar entering the United States), or where duties are levied on the commodities for revenue purposes, as in the case of tea and coffee. The Imperial Marketing Board, established after the imperial conference of 1926, aims to secure for the British dominions and colonies some of the advantages sought through preference by stimulating a "consciousness of empire" which it is hoped will result in a greater purchase of empire products by empire inhabitants.

Colonial shipping policies are of various types. Metropolitan colonial and intercolonial trade may be open to all vessels, with no discrimination, as in some British, Dutch, Belgian

and German colonies. Or the trade may be free in this way, but with preferential rates given to dutiable merchandise when transported directly from the country of export, as in certain cases of British dominions and British and French colonies. Preferential tariff rates or additional preferences may apply only if goods are carried in national vessels, as in the case of Portugal. Moreover, irrespective of tariffs, carriage may be restricted wholly or partly to national bottoms; Spain, Portugal, Japan and the United States have used this device at various times. Such policies help the national merchant marine but do not benefit trade, and the trend is away from their further use. In fairly rare cases preferential port and tonnage dues and fees are used. Bunkering discrimination occurs also occasionally. Of greater importance are larger phases of the merchant marine policies of leading nations. Often, if not usually, when direct subsidies, subventions, special mail contracts, loans to builders or operators and other aids are given to shipping, a government attaches conditions requiring maintenance of lines and routes between home and other ports; these others are frequently colonial. The merchant marine policy thus includes maintenance of economic connections with colonies.

The importance of trade finance in colonial economic relations is indicated by the large network of branch banks and other financial agencies which Great Britain spread throughout her overseas possessions prior to the World War—the most widespread and successful system of its kind. The British colonial commercial system is almost inconceivable without the colonial banking system facilitated by British legislation. The export of British capital to the colonies has been mainly in connection with trade or for investments in colonial enterprise or government bonds. Although complete authentic figures are not available the United Kingdom is estimated by some to have as much as \$15,000,000,000 to \$20,000,000,000 abroad, of which \$3,500,000,000 are in India and over \$2,225,000,000 in Canada; these estimates, however, seem high. A goodly proportion of the total is certainly in various parts of the empire. The flow of capital from other colonial powers—Germany, France, Belgium, Japan and, especially in recent times, the United States—has been only in a small degree toward their colonial possessions.

The basic phase of colonial economic relations and policies is that which may be generically

termed industrial, including extractive operations and construction as well as manufacturing. These relations and policies are not only important in themselves but in turn affect trade and trade policy. With regard to them, treaties guaranteeing the open door are rare and often the policy is one of restriction through legislation or administrative action. This entire category is sometimes covered by the phrase "the concession system," but this is not entirely accurate since outright ownership is just as important as leasing and the term generally implies only the latter. Acquisition by leading British, British-Dutch and American oil companies of petroleum resources in outlying areas, including important colonies, although it may not be entirely typical because it is marked at times by spectacular rivalry, serves for emphasis. In such cases the open door prevails in many colonies, especially where the oil resources are less important, and American and French interests have recently obtained participation with the British in Iraq. In the British Empire the policy varies widely from colony to colony. But some of the most important petroleum deposits in the British and Dutch empires, for example Dutch East Indies, have been closed legislatively or administratively at various times. In the case of non-ferrous minerals there are many instances of exploitation advantage through colonial policy, though here again there are instances of the open door. The leading plantations are usually owned and managed by mother country enterprise. For a comprehensive program of industrial and transportation utilization perhaps no more striking case is found than Japanese operations in Kwangtung leased territory and in controlled portions of South Manchuria.

An important phase of colonial economic policy, especially in the case of tropical colonization, is the question of the economic treatment of the natives. Frequently land owned by natives has been expropriated to make possible exploitation of the soil and its resources. White labor is generally out of the question, and it has often been necessary to adopt policies of actual or approximate compulsion in order to get the natives to work for the whites. Forced labor has sometimes been a matter of definite legislation, sometimes of policies of private companies. Occasionally the same end has been achieved by levying a head tax upon the natives, so large that they must remain constantly at work in order to pay it. Wage policy has been the subject of a conflict between producing and com-

mercial groups in the colonies. The former, seeking low costs, have tried to keep wages low, while the latter, interested in increasing consumption through a higher standard of living, have urged the payment of higher wages.

A survey of the restrictive features of colonial economic policy emphasizes the negative and exploitative aspects of the question. The following phases should not be forgotten: the frequent lack of restrictions and exploitations; the still more frequent absence of discriminations; the considerable economic benefits to the world at large and even to the controlled areas; the natural character of many of the policies, on the basis of differentiation of area economics, and the likelihood of their continuation in one or another form.

COLONIAL SYSTEM is a term used to designate an arrangement by which a mother country attempts to bind her colonies to herself by commercial ties, with the primary object of promoting her own economic advantage. The precise form of such a system depends on a number of factors, chiefly on the opportunities offered by the natural resources of the colonies and the uses for them suggested by the dominant economic notions of any given period.

The most famous and most fully developed colonial systems were those which resulted from the policies of the countries of western Europe from the beginning of the period of great geographical discoveries in the fifteenth century to the end of the eighteenth century. Under the influence of growing national self-consciousness and the conviction that in trade one nation gained at the expense of another each of these countries pursued a policy of strict monopoly of colonial trade. Spain was the pioneer. Her conquests in Mexico and Peru gave her access to supplies of the precious metals, while the stress laid by contemporary economic thought on the importance of the accumulation of stores of gold and silver as the means of building up national power suggested the course she ought to adopt. Hence the Spanish system involved a complete state monopoly in which all other considerations were subordinated to that of getting and transferring to the mother country the maximum amount of the precious metals. Naturally Spain's European rivals attempted to intercept the Spanish fleets, and Spain was consequently obliged to provide convoys and limit sailings. The Spanish colonists felt the scarcity of shipping so severely that visits from foreign vessels were welcomed and illicit trade developed.

The countries which took advantage of the necessities of the Spanish colonists were no less

convinced than Spain that to allow foreigners free access to their colonies was prejudicial to the national interest. That they avoided some of the crudities of the Spanish system was largely due to the fact that they did not have the same temptations, since direct importation of the precious metals from their colonies was not possible. The contemporary faith in trade regulation furnished a clue to the policy to be followed. The mercantilist doctrine that for any country exports must exceed imports in value in order that the difference should be paid in treasure involved a close scrutiny of trade to discover whether the balance was favorable or unfavorable. To correct unfavorable balances it was possible for a country to restrict or prohibit the importation of luxuries or commodities which could be supplied at home, but there were always necessities which had to be obtained from abroad. Colonization seemed to offer a solution of this problem. The activities of the colonists could be so directed by the mother country that its dependence on foreign countries for certain commodities might be eliminated and new markets for its manufactured goods developed.

These were the basic ideas which governed the early colonial policy of France and England. The French colonial system was one of strict political and economic control. Her colonists were to purchase manufactured goods from France; the produce of the settlements was to be exported to France. Colbert (*q.v.*) was not an innovator in this field but tried to extend and enforce principles which were generally regarded as sound. Although England allowed her colonists considerable freedom in developing their political institutions she also elaborated a code of commercial regulation. The colonists were not to establish industries, such as wool and iron, which would restrict their demand for English goods. Specified products, such as sugar and tobacco, were to be sent to England for reshipment. The carrying trade between the mother country and the colonies was limited to English (including colonial) shipping. These arrangements seemed justified to contemporaries on a number of grounds. It was argued, for instance by Josiah Child (*q.v.*), that emigration was an economic loss to the mother country unless colonial trade was strictly regulated by law. England had permanent unfavorable balances in trade with the Baltic and the Mediterranean areas. The Baltic trade was largely in naval stores, such as tar, pitch, masts and the like, which were indispensable. Bounties were

therefore paid on the production of these commodities in the American colonies, while the hope was entertained that the climate of the Carolinas would enable them to supply Mediterranean products. Some mercantilist writers, for instance Joshua Gee, strongly advocated a wide extension of the bounty system. Great stress was also laid on the importance of the colonial trade as a means of promoting employment at home. The manufacture of goods for a reserved market, the building and manning of ships for a monopolized trade and the handling of such products as sugar and tobacco, large quantities of which were reexported, seemed calculated to achieve this end.

The colonial system, particularly that of England and France, was gradually fashioned by these ideas and may be said to have taken definite form in the later years of the seventeenth century. But it was then already becoming clear that colonial systems could not remain mutually exclusive. In a treaty of neutrality of 1686 England and France had agreed not to trade with one another's dependencies, but it was impossible to maintain the balance within a single system so that it should be self-supporting. On the one hand, the French West Indian islands developed sugar production to such an extent that the planters and their slaves could not get adequate supplies of necessities from France and the French settlements scattered from Canada to Louisiana. On the other hand, the New England colonies had a surplus which could not be profitably disposed of in the English West Indian islands. Consequently, the illicit trade grew. An attempt was made in the so-called Molasses Act of 1733 to suppress the trade between the New England colonies and the French plantations, but from its passage it was practically a dead letter. This was the most striking breach in the colonial system and it proved to be one which could not be healed, for when in 1764 England tried to enforce control in a modified way immediate resistance was aroused. Nevertheless, the idea that colonies could be fitted into a preconceived scheme in defiance of basic economic facts died hard. It survived the revolt of the American colonies and the arguments of Adam Smith, but the nineteenth century witnessed its supersession. The Spanish settlements in South America became independent republics and the principle of self-government, with the necessary corollary of fiscal autonomy, was recognized within the British Empire; while the principle of freedom

of commercial intercourse was extended in large measure to all modern colonies. Only in attempts to create favored customs areas can one trace the persistence in modified form of the assumptions underlying the developed colonial systems.

COLONIES. The term "colony" (Latin *colonia*, Greek *ἀποικία*) originally meant a transplanted fragment of a human society. This settlement might be in full possession of its new home or merely an organized group in the midst of a foreign and even a hostile population. It is thus still correct to speak of the Italian "colony" in French Tunisia or the European "colony" in Tokyo, although both are subject to foreign jurisdiction. In the political sense a colony is either (a) a settlement of the subjects of a state beyond its frontiers or (b) a territorial unit geographically separated from a state but owing allegiance to it in some specific and tangible way. In the contemporary world the second meaning has overshadowed the first. For example, Australia and Algeria are not technically "colonies," although outstanding examples of the transplantation of British and French citizens respectively. Australia is a dominion; Algeria is considered an integral part of France. Morocco is a protectorate, not a colony, although many Frenchmen live there and the administration is largely controlled from Paris. On the other hand, Indo-China is technically a colony, although Frenchmen form less than one percent of the population.

The significance of colonies has changed so much with the passage of centuries that there is no hope of grasping it in the large except by

a resort to history. Colonization of the various types has been one of the most powerful instruments making for the diffusion of culture and for the economic and political integration of the world. Under various names two main types are generally distinguished: the settlement colony and the exploitation colony.

In general, the settlement colony is one in which the geographical environment is not very different from that of the mother country. It is all the more characteristic if the area settled is sparsely populated and the natives are decidedly inferior to the colonists in economic organization. The early English colonies on the North American mainland are good examples—Australia perhaps better still. The exploitation colony, on the contrary, consists typically of a small group of business men, administrators, soldiers or all three, thrust into conditions quite different from those of their home country. The region may be densely populated by natives and possessed of a mature civilization. Many such colonies are in the tropics and subtropics. If the mother country is in the temperate zone the two sets of natural resources differ greatly. There is a tendency, therefore, for colonial plantations to develop, specializing in crops not suited to home conditions. Slavery and forced labor are likely to appear where climatic conditions are such that the colonists cannot endure sustained physical effort.

Other classifications cut more or less across the usual one, as stated above. Colonization is sometimes official, or fostered by a government in its own interest. Sometimes, on the contrary, the motivation is predominantly private. Individuals, guild groups, or chartered or regulated companies migrate—also in pursuit of their interests as they see them. Government permission is generally involved, but not always. People may leave a tolerable situation at home in order to better themselves; but if conditions at home are deemed intolerable a migration may take place without any adequate knowledge of what awaits the colonists. Here the definite motivation is rather away from than toward something. Finally, these permanent migrations are great or small in point of distance, by sea or land and to contiguous or non-contiguous areas. All these classifications are likely to be interwoven in actual cases, as the following historical sketch will suggest.

Chinese colonization has expressed most of the simpler types—down to the time when great national states formulated intricate com-

mercial policies and sought distant raw materials for home industries producing for a real world market. Conquests beyond the frontiers in Manchuria, Mongolia, Tibet and Tonkin, mainly to curb disorder and make these frontiers safer, were followed by Chinese colonization. Native leaders were assigned ranks corresponding to those of Chinese society. Other Chinese then emigrated, including tradesmen, farmers, criminals and political refugees. Most of these colonists were males, who intermarried with native women, acquired property and set up what was in many ways an extension of the home civilization. Later, individual enterprise led vast numbers of Chinese to migrate southward into Indo-China, the various Malay countries and eventually almost around the world. Although China followed up these migrations to some extent with the assertion of authority, her political organization did not prove adapted to a well knit colonial empire.

The territories of the Phoenician city-states were too small for a teeming population, exposed to invasions from the great land empires. In fact, the prosperity of this strip of coast in the eastern Mediterranean was founded on easy access to and from Asia by land routes and its frontage on the "middle sea" of the ancient world. Civilization was advancing westward. Phoenician traders carried luxuries and manufactured wares to the ruler peoples of the West and collected raw materials such as copper, iron, lead and gold. From the African coast they took wool, hides, ivory, ostrich feathers, perhaps livestock and almost certainly slaves. Although Phoenician trading posts and some actual colonies were scattered around the Aegean and Mediterranean seas by 1700 B.C.—the period of Sidon's early leadership—it was later under Tyre that the Phoenicians were the great civilizing agents. Carthage (Karth-Hadeth, or New City), founded about 800 B.C. when Utica near by was already centuries old, became the outstanding commercial center of the West after the decline of Tyre. Generally the Phoenicians contented themselves with defensible and well situated trading posts. Some of these, like Carthage, grew so populous that they were obliged to incorporate agricultural areas to insure their food supply.

Outside of western Sicily and the northern part of what is now Tunisia, which were developed intensively, Carthaginian colonization was of the loose commercial type. Carthaginian power rested mainly on a system of alliances

with native chieftains, on fleets and on the ability to hire mercenaries with the profits of trade; ports, mines and inland trading centers were widely scattered. Commercially ancient Carthage occupied somewhat the situation of London in the contemporary world. In the main it aimed at political dominion only when forced to do so by Greek and Roman competition. There can be no doubt of the tremendous role played by Phoenician and Carthaginian colonization in transmitting westward the highly developed material culture of the ancient Near East. Moreover, the Near Eastern social structure and religious bias were never overcome under the Romans. Successive eastern religions, including Mithraism, Christianity and Judaism, developed great theologians and militant leaders in the territory of old Carthage, were torn by passionate schismatic movements and disappeared under the waves of the new, less occidentalized faith of Mohammed.

Greek colonization gradually supplanted Phoenician in the Aegean and eastern Mediterranean after about 750 B.C. The Greeks, especially those on the European side of the Aegean Sea, proved better insulated from the imperial adventures of Egypt and the great land powers of western Asia. The home lands of the Greeks, like those of the Phoenicians, were valuable rather because of their situation along potential trade routes than for their natural produce. The Greeks scattered trading, mining and agricultural settlements from the Black Sea to the western Mediterranean. Unlike the Phoenicians who remained behind, the Carthaginians were beyond the reach of the Egyptians, Assyrians and Persians and were thus able to check the Greek expansion westward.

The typical Greek colony was modeled closely after its home city but was largely independent, although the cleruchs, or transplanted citizens, of certain Athenian settlements retained their citizenship. No tribute was exacted by the mother city-state. Émigré citizens enjoyed very general exemptions from civic, legal and religious duties in Athens, and local autonomy included even the right to coin copper. Yet the Athenian courts assumed superior jurisdiction in some cases.

The evolution of the extent of control from the home city was curious. Generally planted, like those of Phoenicia, as trading stations, the colonies were often closely supervised at the outset. But they showed a much stronger tendency than the Phoenician colonies to spread

out and become largely agricultural. When they had reached this stage they were practically autonomous and sometimes they achieved full independence. The home community often protected them and it was considered a crime for a daughter city to attack its parent. A close similarity of social life and common trading interests preserved connections which were actually much more tangible than they seem to us. In the end, colonies like the Athenian cleruchies showed a return to a more formal system of control and an approach to the later Roman type.

Alexander the Great attempted to combine the advantages of the trading communities founded on the basis of free or largely autonomous cities with the disciplined unity of the great land empires which he conquered. His triple purpose in founding his colonies was to provide homes for veterans, garrison conquered territory and Hellenize his empire. Similar policies were continued by the Seleucids and Ptolemies who succeeded him. Alexandria in Egypt soon had around 400,000 inhabitants; Antioch was slightly smaller; Seleucia, on the Tigris, was the third city of really imposing size. The importance of all these was due in large part to the already considerable Levant trade which reached the Mediterranean by ships and caravans. Hellenization largely failed, even the colonized veterans being in the main non-Greek mercenaries. Many of the Greek officials merely enriched themselves, and the attempt to associate them with orientals in a workable administration proved futile. Trade and trading colonies languished in the too rigid framework of centralized authority. Exploitation, discontent and bankruptcy were gradually dissolving the Hellenistic empires into their constituent trading and agricultural elements when Rome inherited the idea of uniting a huge territory under a god ruler and a legal framework which would serve if not satisfy interests of every type.

Under the force of Greek and native competition Carthage might have achieved a genuine, well knit colonial empire but for the rise of Rome in the larger, richer environment north of the Mediterranean. Before Rome became an empire in the dual sense of far flung dominion and deified authority at the center, the state had expanded in Italy and even beyond. This early colonial expansion had been almost entirely by official conquest and settlement. Overpopulation had never been a real problem and the original Romans were not a trading people like

the Phoenicians and Greeks. They colonized veterans more or less systematically and occupied one piece of adjacent territory after another to suppress frontier nuisances and gratify the impulse toward dominion. Likewise in the imperial period the Roman state suppressed one rival after another, settlement through emigration coming later if at all. Often the interval between conquest and emigration was fairly long, as in the case of Africa after the destruction of Carthage. There was little interference with local customs which did not obviously clash with the Roman law. The Latin language became the official, although not always the popular, one. Taxes and military service were generally less burdensome than before. Roads were built to unify colonial areas commercially and facilitate the keeping of public order. Religions were Romanized to the extent of suppressing elements contrary to Roman law and inserting the religious-patriotic attitude deemed by the government necessary to its safety.

Full Roman citizenship was finally conferred upon colonists, but most of those who enjoyed its privileges were of native origin, more or less Romanized. These undestroyed roots of native culture retained enough vitality under the grafted Romanism to be a source of weakness to the empire when the crisis of disruption came. Colonization, both as a process of actual transplantation and as a reshaping of ethnic elements already on the scene, lagged behind the official measures too uniformly to produce real vitality. Too much political direction from Rome was unhealthy; extensive industrial concessions led to an artificial social system which, as population increased and the submerged classes grew conscious of their position, made trouble in places like north Africa; and the economic effects of too much political interference in business enterprise were equally bad. Roman policy encouraged dependence upon Egyptian and north African grains and oils, allowing Italian production of these staples to decline. When the fairly regular Egyptian supply was diverted to the new capital at Constantinople and the more erratic north African supply jeopardized by social unrest and civil wars, Italy's position became worse than it had been before the expansion beyond the peninsula.

Mediaeval Italian city-states like Venice and Genoa planted colonies along the trade routes. After the beginning of the crusades various Italian colonies in Near Eastern trading centers were able to bargain for an autonomy amounting

almost to independence within the feudal states and fiefs set up there by force of north European arms. These colonies often had important rural holdings adjoining their quarters in the towns. They had their own laws and administrative machinery, modeled upon those of the home cities, which exerted over them a close supervision. Tax immunities to religious bodies crippled state finances, and the feuds of rival trading towns helped to further the reaction to Mohammedanism. In the end, many of the Italian colonies survived the wreck of the feudal governments and continued to enjoy their privileges under the Moslems. But it should be remembered that European colonization across the Mediterranean in the Middle Ages was always artificial. In spite of the colonization the Mohammedans remained in control of vital links in the trade routes from Orient to Occident, across the Indian Ocean and through the vast arid crescent stretching from Morocco to the Red Sea and on around to the heart of Asia. Europeans were tolerated in terminal positions where their presence was an advantage to the Moslem middlemen in the eastern trade.

The mediaeval European colonization of last- ing interest was the product of the great expansion northward and eastward during this period, which settled and organized the two thirds of the continent never held by the ancient empires. Monks led in the reclamation of central and eastern Germany, although the work was taken up also by political units and lay groups of emigrants from overpopulated regions like the Low Countries. The Eastern church played a similar role in the opening up of Russia. This great "expansion of Europe" within the continent itself is one of the most important and most neglected colonizing movements in history. It was the preliminary to the more familiar expansion of Europe overseas at the opening of modern times.

Portuguese colonization down the African coast was a continuation of the crusading struggle with the Moors. Defeated on land in Morocco, the Portuguese extended their line of ports and crept southward by sea until by the middle of the fifteenth century they had reached the east-to-west Guinea coast. Here they found wealth in the form of gold and slaves. These resources, the revived ancient belief that the treasures of the Indies could be reached by sea and the continued zeal of the struggle with Islam led them on, until they reached their goal in another half century. Their establishment in Brazil must

be set down to accident. An Italian adventurer, Columbus, had vainly tried to sell the Portuguese government the rival scheme of a westward voyage to the Orient. During a lull in the Spanish crusading wars with the Moors the crown of Spain took up this plan as a sort of gambling chance. While the identity of the lands thus far reached was still in doubt, the pope tried to avoid trouble between the two rival colonial powers by setting up an arbitrary north-to-south line as a boundary. Unaware of the eastward projection of northern South America, the treaty makers of 1494 so placed this line as to give Portugal eastern Brazil.

The dominance of Portuguese colonization came at the beginning of a period of commercial change. Regular commercial trips across the open sea had been made in the Indian Ocean since the first century of the Christian era, but mediaeval improvements in navigation instruments, maps and shipping gave such voyages an entirely new degree of safety, cheapness and flexibility. Especially was it now more feasible to vary the itinerary as to time and points of call, independently of seasonal winds and currents. European states were able to get around the western end of the long Mohammedan barrier to oriental goods and to break the Moslem monopoly of trade across the Indian Ocean. Both these direct sea voyages into far eastern waters and the similar ones to America were expensive, but national states had been forming in Atlantic Europe capable of raising the funds and controlling the markets demanded by enterprises of the new scope.

Except for the scale of operations, Portuguese trade and colonization departed little from the time honored mediaeval precedents of strict governmental control and emphasis on commerce rather than settlement. Italian and German financial backing and established Low Countries markets were used. During a century of practical monopoly of the new eastern routes the transport economies were such that the little country was greatly enriched. The old Levant forwarding trade languished and with it the commercial primacy of the Italian towns. Brazil became a tropical plantation colony before its gold mines were important. Even before the sixteenth century was over, Dutch and English interlopers had broken in upon the African slave trade which grew up with European plantation and mining activities in the tropics and subtropics. Both Portuguese and Spanish operations were so tremendously profitable as to

conceal the fact that they might have been much more so with less sacrifice of flexibility and private initiative. The emphasis upon missionary enterprise was to be expected from the nature of the populous tropical plantations and mining settlements, as well as from the relationship of church and state in passionately Catholic countries at the time. Nevertheless, the division of authority between clerical and lay administrators was to prove a great handicap to efficiency in the later competition with other nations.

Spanish and Portuguese policies were similar, except that Spain drew her great wealth from accumulated treasures and, later, mines of precious metal rather than exotic plantation products and handicraft wares. Labor and native relations raised much the same problems for both countries, as did also missionary activities and the schisms of authority between state and church officials. The revolt of the Low Countries and the conquest of Portugal by Spain ruined the Portuguese monopoly of north European markets. Both the Dutch and the English saw that Spain's colonial and trading supremacy depended upon sea power to protect the lanes she used. The disaster to Spain's great fleet in 1588 gave them courage to embrace a systematic policy of wearing down this weakest link in the Spanish system. Another fatal weakness in Spanish and Portuguese colonization was the lack of an industrial development adequate to supply the needs of the colonists. Dutch, English and French goods were so much cheaper and more varied that the colonists bought them in spite of prohibitions. Buyers and sellers shared with state officials the enormous profits of clandestine trade. In 1701 the *asiento*, or contract right to carry African slaves to the Spanish colonies, was given to the French, and in 1713 by force of arms it fell to the English, together with trading privileges which formed an entering wedge into the Spanish commercial monopoly.

Spain scattered the money power her colonial mines gave her in fruitless European wars. The soldiers she hired were economically a pure loss, and the supplies she bought encouraged the economic development of her competitors rather than her own. Moreover, Spanish prices rose inordinately with the rapid introduction of silver and attempts to prevent its escape abroad. The high prices stimulated imports, and even when imports were made illegal the price differentials were often so great as to invite the corruption

of officials. A Casa de Contratación, or Bureau of Commerce, under the royal Council of the Indies regulated colonial trade in such detail that there was little room for the private companies and individual enterprises which played so great a role in the countries north of Spain and Portugal. The Portuguese Casa da Índia was very similar.

Both of the Iberian countries transplanted their languages, and to a considerable extent their social institutions, to vast areas overseas. They failed to make any adjustment in their policies commensurate with the extent of their opportunities, so that neither of the countries profited materially in the end. This was largely due to the mercantilist notion that colonies should be economically exotic, complementing the trade and industry of the home country at all points and never competing with her products. All the nations shared this prejudice in favor of exploitation colonies in early modern times; England had it almost, if not quite, down to the American Revolution. It was the misfortune of Portugal and Spain that they were first in the field and that their entire colonial history was dominated by this ideal. Settlement colonies were to prove superior as aids to solid national growth, in spite of the low esteem in which they were long held and in spite of attempts to make them economically exotic in defiance of their basic geography.

France was the first great western nation to collide squarely with the military power Spain derived so largely from her colonial treasures. This struggle was mainly European during the sixteenth century, however, and in spite of the famous demand of Francis I to be shown the paragraph in Adam's will which left Spain and Portugal the sole places in the sun, it was not during that period extended to the colonial possessions. Although the Dutch and English actually led the serious direct assault upon that monopoly, France's first colonial empire represented a deviation from the type established by the Iberian countries. It was an intermediate type between these colonies and those of the northern countries. In her position as a continental land power France developed a centralized government capable of mobilizing her resources in crises. As a sea power with strong Mediterranean interests and a Turkish alliance she faced two ways, somewhat like Spain. Such a political organization, so situated, was sensitive about the diversion of important resources by groups of private business men for distant

ventures. Richelieu wished to imitate the great Dutch private companies, but most of his charters were abused, abandoned or associated with state aims in almost Spanish fashion. Nevertheless, French colonization took firm hold in Canada, the West Indies and Senegal. Colbert (controller of finances 1661-83) founded more imposing companies, but most of them were short lived. The European imperial schemes of "Grand Monarchy" made enormous demands upon French resources which everywhere hampered the execution of the most far sighted colonial policy of the old regime. Representative government had disappeared and French business interests had no adequate way of expressing themselves. Colbert's nice phrases about commerce being free as a product of "the pure will of men" did not prevent him from leaving colonial trade in the straitjacket of government regulation known as the *pacte colonial* or "old colonial system." Colonial laws were framed in Paris and intendants sent out to supervise their administration.

Missionary activities played in the French colonies a lesser role than in the Spanish and Portuguese but a much greater one than in Dutch or English possessions. France stressed the mercantilist notion of non-competitive colonial production almost as much as did Spain. Neither Canada nor Louisiana ever attained as factors in French commerce the importance of the East and West Indies and the African coast. The settling of families was never particularly stressed, and religious dissidents, when not forbidden to emigrate, were discouraged from doing so. The West India plantations, then the world's sugar bowl, were commercially cropped by the aid of slave labor. East India was almost entirely lost in the end because the French government was too much preoccupied in Europe to furnish a moderate amount of support. The populous English colonies on the North American mainland overcame the thinly peopled French ones. Finally, the transplanted Africans ejected the French planters from the richest West India colony, Saint-Domingue, and only fragments of a colonial empire remained. Like other nations at the time, France had emphasized the exploitation colony, whose climate and conditions did not favor the multiplication of Europeans. Unlike England, she had not been inadvertently saved by private enterprises, which made the most of the colonial leavings and prepared a future which nobody clearly foresaw.

Dutch companies were in many ways the pioneers of a new era of colonial expansion. After the Spaniards had ruined the southern Netherlands in the sixteenth century, Amsterdam became the leading financial center of Europe. In their advanced banking and exchange methods and their truly revolutionary standardized production in such industries as shipbuilding, the Dutch possessed elements of undoubted superiority over their competitors. But the Netherlands is a small country, with natural resources limited even for its area. Moreover, the Dutch placed too much emphasis on purely commercial advantages, too little on actual settlement. New Amsterdam, their one most promising colony in the temperate zone, was lost largely because of bureaucratic administration which crippled free enterprise and failed to enlist the loyalty of the colonists. The result was that the English forged ahead. Allied with England through a common royal family, a common Protestantism and a common enmity against France at a critical period, the Dutch somehow wriggled through modern history without losing their East Indian empire. But they had not the luck of the English to prepare themselves unconsciously for an industrial revolution which was to stress coal and iron as well as sea power, rational economic organization and broad markets.

A set of fortunate coincidences launched England in the colonial race at just the right times and places. Among these coincidences were her isolation from continental disturbances, a juncture in an agricultural transformation and a religious revolt which gave her emigrants to spare, the development of her fisheries and the weakening of Hanseatic trade competition. During the sixteenth century, moreover, Englishmen accumulated blocks of mobile capital through trading ventures in the Baltic and elsewhere and by looting Spanish treasure ships. The joint stock principle of organization had reached northern Europe from Italy. Portuguese trade in the East was developed but vulnerable after the conquest of 1580 by Spain, and Spain was herself weakened by her military efforts and the loss of her ill advised Armada of 1588. Tobacco culture had been Europeanized by the Spaniards and a market built up. The eastern margin of North America was open to colonization, semicivilized natives having even cleared a good deal of land and established food crops. Nor can we discount the effect of an imaginative literature about

America, tending to make the initial task of colonization seem easier and more remunerative than it actually proved to be.

The complex material interests of Englishmen were given better representation in their government than was the case in Portugal, Spain or France. Accompanying ideas and habits of self-government were especially important at what was then a tremendous distance from the home country. The North American mainland was relatively unpopulated and unexploited, yet suited by conditions of climate and soil to the settlement by north Europeans. All attempts failed therefore to make this temperate zone region fit into the mercantilist scheme of exotic, non-competing plantation colonies. Monopoly privileges granted by charters and patents to private groups and individuals could not be closely regulated at such a distance, in environments to be conquered by settlement rather than by the methods of exploitation which had grown up in trading ventures and plantations in hot countries. Much of the business mechanism of colonization was transplanted, became semi-autonomous in the process of meeting new problems and gradually acquired characteristics of its own.

By the eighteenth century this block of settlement colonies had developed into an enormous paradox in a national and world system founded on the plantation colony idea. England herself had vast interests in the East and West Indies and was inclined to favor these regions as fields for business enterprise and conquest rather than settlement. Her colonial administration was thus a house divided against itself. In the end her government failed to adjust itself in time to the peculiar economic needs of the settlement colonies. The idea of dominion status, based on equality and community of interests between practically free nations in perpetual alliance, matured only after an American war of independence and an industrial revolution had undermined the old policies and pointed the way to the new.

In India repeated reforms and increased regulation of the great East India Company failed to solve a problem which grew more complex with the passage of time. Amid the world communications and markets of the nineteenth century, the political responsibility of governments could no longer be delegated to private trading corporations. After the Sepoy Revolt of 1857 the British government superseded the company, and two decades later India was made

technically a separate state under a common British queen empress. Since then this vast and largely tropical territory has made long strides in the general direction of dominion status, but the problem of India in the British colonial system is still far from solved.

Colonial handicraft products such as textiles were widely copied in Europe. This market, purloined from the civilized tropics and greatly enlarged by the addition of newer colonies, laid the basis for mass production or the duplication of articles and processes on a large scale. Thus it became possible to isolate operations and simplify them to the point where they could be repeated by machinery. Economies achieved through such mechanization so enlarged the markets for standardized industrial products that for a time the old mercantile struggle for colonial monopolies seemed unnecessary. During the whole middle part of the nineteenth century, governments- in which business interests were now more fully represented- generally adopted a negative attitude toward colonies. For example, Frenchmen violently objected to Algerian competition with their agricultural produce but were on the whole lukewarm to projects for introducing non-competitive economic activities.

Then gradually appeared the shift "from Manchester to Birmingham". That is, from emphasis upon markets for consumption goods to those for productive machinery. It soon became apparent that by building railways, exporting machines and generally Europeanizing economic life in new or backward countries the markets for finished products could be created. But this meant also that there were limits set upon the creation of fresh markets. Producers' profit margins narrowed, and some industries were always in danger of migrating to cheaper labor or raw materials and nearer markets. Where the falling cost of transport enabled old centers to hold their industries in spite of distances, there was often the problem of insuring the supply of some indispensable raw material. Reversing the whole current of world history so far, the new mechanized industry found it necessary to dominate commerce.

In the economic regime of closely figured differentials between costs and sale prices European investors more and more calculated the relative advantages of plants located thousands of miles apart. The ensuing "export of capital" across frontiers and into regions offering the best combinations of profit and safety initiated

a new colonial struggle. Protection and public order take on an entirely new importance where expensive equipment has been placed, requiring years or decades to return its cost to investors. Representative governments which largely balance and express the force of complex material interests cannot avoid taking part in the struggle for basic raw materials, opportunities for placing capital and markets for such consumers' goods as cannot be made in competition with other producers unless sold in large volume.

In this new colonial era England had certain appreciable advantages. She had the great textile markets and the lead in the change to power machinery. As a largely monopolized investment field India is no less important than it once was as a different type of market. The Suez Canal, acquired at the beginning of the contemporary colonial movement, is a vital key not only to Australasia and the Indian empire but to the trade with other parts of the Orient as well. England's imperial route through the Mediterranean is safe only to the extent that the contacts of other colonial powers like France and Italy with their possessions across that lane are unsafe. Perfect security from war would make these terms meaningless, but such security must first of all satisfy the economic interests which play upon the governments through their representative machinery.

Germany after her consolidation into a national unity found herself hampered in colonial and trade competition by the entrenched special privileges of her older competitors in a large fraction of the world. She shared in the general scramble for what remained undivided in Africa in the railway age. Failing to get really valuable settlement colonies of her own, she associated herself with the Turks to modernize a vast Near Eastern territory which had stagnated economically after the great early modern trade routes took their course around it. German penetration by land was felt to be a menace to the British water route through Suez. It also cut squarely across the outlet to warm water at Constantinople which the Russians had long planned to own one day. By vitalizing the Turkish Empire the German scheme also threatened Russian colonial expansion over the Caucasus and into Persia. Nor did France, the traditional ally of the Turks for centuries, view this new alliance with friendly eyes. The transformation of the whole Near East promised by the Bagdad Railway and by the system of alliances and other arrangements accompanying it affected

the treasured privileges of so many powers, large and small, that it must be put down as a major cause of the World War. Germany's position in northeastern China excited the jealousy of Japan and to some extent of other powers as well. The various Moroccan crises were mainly the result of Germany's refusal to allow the traditional "interested powers" to increase their privileges without international sanction or the granting of compensation.

Russian colonial expansion eastward across Siberia is one of the historical phenomena of modern times. It has been aptly compared with the westward expansion of the United States. Both were made fully realizable in vast, largely open and largely empty regions by the development of the railway. The Russo-Japanese War halted the Russian advance upon China; and the clash with British colonial interests near the borders of India was quelled only in the presence of the German menace to both parties. Post-war Russia, organized as a federation of heterogeneous groups, has resumed the colonial race on terms which her rivals denounce as a betrayal of the traditions of occidental civilization.

France, in her new colonial empire as in her older one, has perhaps held closer to the historic precedents than any other great power. She has emphasized commercial advantage and exotic, non-competitive products rather than settlement. This has been due in part to the type of lands available to her in the nineteenth century. Algeria was geographically suitable for French settlement, but it had a population of its own with an ancient and proud civilization. This colony, since absorbed into the home administrative framework, furnished the model for later efforts. Besides being mainly tropical Indo-China was also peopled and civilized when the French arrived. This great region is a mixture of protectorates and colonies, the former arrangement working better than the latter. France had no considerable surplus population to put into Tunisia, which could not be annexed outright in any case because of international complications. The protectorate there is a greatly modified expression of earlier experience in Algeria, and still further changes were made in taking over the direction of Moroccan affairs. The acquisition of man power has been a frank and important aim of French policies in north Africa. With the penetration of the Sahara by modern transport media the northern strip of Africa has also become the key to French

possessions near the equator. It has been linked together by railways and roads for both military and economic reasons. The proposed trans-Saharan railway would make French northern and central Africa an emergency military and economic unit in case of assault by a strong sea power.

Probably the fiercest European colonial rivalry at the present time is that between France and Italy. In the colonial struggle of the late nineteenth century Italy obtained decidedly second rate possessions. Sicilians left their overpopulated island in numbers and formed the largest European group, numerically, in French Tunisia. Old treaty rights prevented their absorption by France, and the problem became acute with the rise of Fascist nationalism. France's routes to her African and oriental colonies cut squarely across the imperial lanes of Italy, so that the security of the one runs in terms of the insecurity of the other. Since the war both powers have emphasized submarines, airplanes and other light naval equipment. The presence of strong forces of this type in the Mediterranean, where their destructive power is tremendous, makes Great Britain's mastery of her own imperial lane through that sea impossible. In this peculiar situation any general agreement as to the size and detailed character of navies is practically hopeless, since the craft effective in a rather narrow sea are not those demanded for the protection of world empires such as the British, the Japanese or the American.

American colonization has been peculiar. As long as it moved westward across the continent it met almost no tasks of absorbing civilized societies and compromising with their institutions. The territory has always been underpopulated relative to its resources and to the current habits of exploitation and consumption in the Occident. Toward the end of slavery days there was a political urge toward imperial expansion, founded on internal social and economic differences. This disappeared with the Civil War. During the next quarter century the vacant continental area was practically all taken up, although the country's resources were still far from intensively exploited as compared with western Europe. Thus, acquisitions such as Alaska and Hawaii were due to political circumstances or the fear of possible trouble later on rather than to any vital need.

The export of capital to Cuba played a certain minor part in germinating the war with Spain, which threw Porto Rico and the Philippines

into the path of American acquisition. Cuba was set up as a separate republic, however, and the Philippine occupation has always had elements of the uncertain and temporary in it. The digging of the Panama Canal and the further spread of American enterprise in the Caribbean have made the United States more sensitive about this region. Temporary interventions to prevent the entire collapse of public order or possible European interference have taken place, as in Santo Domingo, Haiti, Nicaragua and even Cuba. None of these has led to protectorates in the European sense. The United States has no vital need of these regions, whether for economic resources or man power. Even where the term protectorate has been used, as in Haiti, the occupation has been formally limited in time and shaped with the idea of evacuation. This fundamental distinction reflects itself in a cleavage between American and European policy so wide that to use the same terminology is to invite misunderstanding.

Many colonies have evolved into distinct entities, such as free nations, dominions and protectorates, which in any appraisal of the effects of modern colonization must be lumped together with less changed areas. On the negative side, the whole process has often robbed native culture and products of a distinctiveness which constituted an important claim to beauty or general interest. In plantation colonies the poorer native frequently loses his land and the richer loses his business identity in a mixed corporation. The standards of living are changed entirely owing to the presence of high salaried managers and technicians from outside, and in the shift imported forms of entertainment sometimes replace native ones immeasurably preferable as art.

The point commonly made about debt bondage, public and private, is in some cases supported by facts and in others not. Areas within great colonial systems often pay lower rates of interest, and very rarely higher ones, than similar independent areas. Furthermore, an examination of cases just before and after absorption into such systems often shows a tremendous drop in the financial burden of debt, due to the reduction of risk and inefficiency. This may be the case even where the principal sums owed are somewhat increased. Certainly western European bankers and financiers, operating under regulations imposed by their own governments, are easier to deal with than the professional money lenders who establish them-

selves in small and unstable countries. Almost any kind of debt bondage pointed out in colonies can be practically duplicated within independent countries or between them. On the other hand, there are cases like India where the form of political and economic control is such that the pressure of material interests upon the government is exerted largely by absentee creditors concerned mainly with the incomes they collect outside the country.

On the positive side, a stable colonial government often encourages new crops, industries and equipment which undoubtedly save labor and increase the revenue from exports. Sanitation is a boon in itself, even though in some cases its swift development leads to overpopulation, intensifying the emphasis upon plantation crops at the expense of subsistence produce raised by small proprietors. The importance of public order is often underestimated by those who take it for granted. In some cases it can be achieved only by a heavy investment in lines of communication which would not pay or be made independently of the economic exploitation they render possible.

There is some ground for the familiar assertion that the export of capital to colonies where it employs cheaper labor and reaps higher returns is an impediment to constructive social legislation at home. The weakness of this charge is that it applies, although perhaps in a lesser degree, to the export of capital elsewhere as well as into colonies. Immigration into the home country has a similar effect in that it renders the stabilization of employment and living conditions more difficult. The trouble seems to be general, inherent in our capitalistic form of enterprise in a world economy with various standards of living, and not a specifically colonial economic disease. From the colonial side this problem is even more specific in its manifestations. Especially in more backward areas the formation of a large class of wage earners upsets the older social organization. A salaried European bureaucracy replaces the native leaders or superimposes itself upon them. The balance of the old community, largely self-supporting and self-governing, is often destroyed, and the new laboring class needs new forms of protection which may be slow in appearing.

Especially since the World War the fact that with respect to colonial development we are in a period of transition has become conspicuous. Tariff rivalries have been intensified. The

French colonial system is only an extreme example of the general tendency to consolidate and monopolize national privileges in outlying territories. Mandates created by the victorious allies from ex-enemy areas have set new precedents. Machinery is now provided whereby such territories may make their grievances known through the League of Nations. Protectorates and colonies are not formally included, but certain general enunciations of principles concerning labor, minorities, arms, opiates and the like furnish entering wedges for bringing the complaints even of national "possessions" into the purview of international opinion. To some extent this is made inevitable by the mere existence of a formally organized body like the League of Nations. Concessions which may affect independence are better controlled than formerly, their terms are more generally known, and arbitrary acts on the basis of non-fulfilment are, in addition to being difficult to prepare in secret, subject to effective protest.

Dominion status, or the association of theoretically equal partners in a "commonwealth of nations," may be the end product of the colonial process where the races are closely related or congenial and the environment admits of population exchange. Under other conditions the growth of native nationalism promises to be a perennial ferment, with independence as the only radical cure. The export of capital and the practical necessities of administration exert relentless pressure for the Europeanization of economic life. In spite of attempts merely to train natives within their own intellectual framework, more and more of them, with the growth of technology and of business organization on the basis of closely calculated costs and prices, are exposed to the elements and the "feel" of European culture. Inside and outside the administrative bureaucracy this Europeanized élite fits its aspirations to the actual system of rewards and resists exclusion from the highest careers.

With the decapitation of native society by taking over its traditional leaders, the struggle for the European types of rights and privileges develops progressively as these become the visible ones most obviously of practical value. Even the Tunisian *destour* movement looks romantically backward to a constitution copied from European models and never really in force. All the new national governments of the Near East have surrendered to basically western forms as well as ideas. The growing national

movement in Indo-China is so disconcertingly western in form and method that the French officials cannot logically combat it without repudiating the basic principles of their own society. Even in India the practical aim is to get rid of British control. If this should be realized it is hardly conceivable that the new state would survive in the contemporary world without the technology and organization irresistibly propagated by the industrial revolution. The Philippines—so obvious is the case—need be no more than mentioned in this connection.

In brief, modern colonization has been mainly an expansion of European ideas and methods. Since the inception of the age of power machinery no alternative has appeared able to impose more than temporary checks to the movement. At the present advanced stage the main problem seems to be that of salvaging those intrinsically valuable elements in older systems of society which might be destroyed in a too sudden transition.

COLONNA, AEGIDIUS. See AEGIDIUS COLONNA.

COLQUHOUN, PATRICK (1745-1820), British economist. Colquhoun was a native of Scotland and after 1766 was prominent in the municipal life of Glasgow, where he served as lord provost (1782-83), founded the chamber of commerce and promoted many projects aimed at the development of industry. He settled in London in 1789 and was appointed to office in the city magistracy. In 1795 he published his *Treatise on the Police of the Metropolis* (7th ed. London 1806), which attracted wide attention through its disclosure of the complete incapacity of the antiquated police system to deal with crime. In *A New and Appropriate System of Education for the Labouring People* (London 1806) and a *Treatise on Indigence* (London 1806) he proposed the establishment of various institutions for the assistance of the lower classes: boards of education, savings banks and a national poor rate which would be uniformly assessed.

He is probably best known for his estimate of the national income and of its distribution among the various classes of the nation, which is contained in his *Treatise on the Population, Wealth, Power and Resources of the British Empire* (London 1814). While he himself admitted that his statistics were only approximately correct, they were based on conscientious consultation of authoritative records: income tax returns, foreign trade figures and other official documents. Colquhoun showed that in 1812 the United Kingdom, with a total population of about seventeen million, produced new wealth amounting to £430,520,000 and that of this the working people, numbering about eight million, received in wages £81,500,000. Assuming, as Colquhoun did, that all wealth was produced by labor he thus showed that it received but one fifth of its produce. From about 1820 on critics of the capitalistic regime and later the socialists found in Colquhoun's treatise the facts and figures they required to demonstrate that the system of private property is based on the

plunder of the laboring poor. His statistics were quoted in Gray's *The Happiness of States* (London 1815), in the Birmingham newspaper the *Midland Representative* (June 25, 1831), in Bray's *Labour's Wrong* (Leeds 1839) and in Robert Owen's autobiography.

COLWELL, STEPHEN (1800-71), American economist. He was a native of West Virginia but during most of his career was identified with the history of Philadelphia, where he attained a commanding position in civic endeavor. Colwell was a protectionist; in 1856 he introduced to American readers Matile's translation of List's *Das nationale System der politischen Oekonomie* (Stuttgart 1841), contributing an extended preliminary essay in which he developed the case for a rounded domestic economy. He served with David A. Wells on the commission appointed in 1865 to revise the revenue system of the United States. As commissioner he prepared studies on the tariff, excise and tax duplication, notably the "Relations of Foreign Trade to Domestic Industry and Internal Revenue" (in United States, Revenue Commission, *Reports* . . . Washington 1866, p. 275-94). His most valuable contribution to economics is embodied in the treatise on the *Ways and Means of Payment, a Full Analysis of the Credit System* (Philadelphia 1859, 2nd ed. 1860), which evidences careful research into the history of European banking. Colwell rejected the quantity theory of money as an explanation of price movements; he criticized the subtreasury system for its emphasis on metal currency and took advanced ground in behalf of a credit currency adjustable to the volume of business. He also called attention to the inadequacy of the commercial country bank for the purpose of meeting the long term credit requirements of agriculture.

COMBINATION ACTS. *See* LABOR MOVEMENT; FREEDOM OF ASSOCIATION.

COMBINATIONS, INDUSTRIAL. An industrial combination, or a combination of several hitherto competing business enterprises, may vary in character from a complete merger at the one extreme to a loose cartel agreement at the other. Although this range comprises a great number of intermediate forms, combinations may be roughly divided into three classes: mergers, "concerns" or combines, and cartels. In the merger, combination is carried to the farthest limit; the manufacturing plants, the financial structures and the commercial organizations of the combining units are merged, resulting in a single, new, fully developed business enterprise. In the concern, combination extends only to the financial and commercial activities; it does not directly affect the other functions of the combining units, and their manufacturing operations, for example, remain free from direct control by the concern. The cartel involves a combination of business enterprises merely as commercial organizations. The combining units submit to a number of mutual restrictions relating to their sales policies but retain complete independence in their financial and manufacturing operations.

Mergers may represent vertical or horizontal combinations; that is, combinations of plants at several successive stages of the production process or combinations of plants on the same production stage. Common examples of vertical combinations are the merger of a coal mine, a coking plant and a plant for the utilization of by-products; or the merger of a lignite mine and a briquette factory; or again the merger of a spinning mill, weaving mill, dyeing plant and finishing mill. The most advanced development of combinations of this type is found in metallurgy, where coal mines, iron ore mines, iron foundries and steel mills are often operated under a single management. Vertical combinations do not necessarily comprise all stages of production; frequently enough the lowest stage reached is that of a semifinished product and the highest stage included is no closer to the consumer than conditions of mass production allow. While a horizontal combination comprises plants on the same stage of the production process, these plants are not always technologically comparable. Thus a lignite-briquetting factory may be combined with an electric plant fueled with lignite; a steel mill using the Thomas process may be merged with a steel mill using the Siemens-Martin process or with an electric plant fueled with by-product gas from the blast furnace. In

addition to vertical and horizontal combinations there are also a few combinations of combinations, enterprises which operate a number of plants for each of the several stages of the production process. Thus we find under a single management several coal mines and several iron ore mines feeding a number of blast furnaces and steel mills which in their turn furnish raw material to a number of metal working plants.

Whether the combination is vertical or horizontal or of the mixed type, it is always true that in a merger the scope and character of manufacture in the several plants is determined down to intimate technical minutiae by the single operating plan worked out for the enterprise as a whole. In vertical combinations the manufacture of raw materials is conditioned both as to quality and quantity by the needs of the plants operating on the next stage of production, and these plants are in their turn forced to rely mainly upon results achieved at the raw material stage. In the horizontal combinations the different plants supplement one another quantitatively and qualitatively.

Generally, but not always, the unification characteristic of a merger finds its legal expression in the fact that the combining units appear in their contacts with the outside world as departments of a single firm. The legal aspects of the merging of hitherto independent enterprises into a newly organized business entity are designated by the term "fusion."

Based as it is on the principle of unitary organization and management the merger is from the socio-economic point of view merely a step in the development of large scale enterprise. It is not surprising, therefore, that mergers appear at a relatively early stage of development. More recently the formation of mergers was stimulated by the increasing stress laid upon the utilization of waste and by-products and upon the development of subordinate lines of production within the parent enterprise. Although mergers are not limited to England they must be recognized as the peculiarly English type of combination. Even where they include plants organized on a mass production basis, combinations in the older English industries, such as textiles and iron and steel, as distinct from combinations in the electric and chemical industries, follow in a majority of cases the merger type rather than the concern type.

Concerns may be organized on the principle of horizontal or of vertical combination, but unlike mergers they do not emphasize primarily

the technological unification of the individual plants. Quite frequently, therefore, concerns represent a mixed horizontal-vertical type of combination. Moreover, concerns often combine under one financial management manufacturing processes which do not dovetail technologically; the fact that the products are used in the satisfaction of identical consumption needs offers in such cases the basis for the combination. A technological basis for the combination is sometimes found in the similarity of industrial research problems. The German Interessengemeinschaft Farbenindustrie, for example, combines the manufacture of coal tar into aniline dyes and drugs with other production processes not involving coal tar, such as the manufacture of explosives, nitrogen, rayon and camera films. The unification, in the concern, of the financial and commercial phases of operation of the individual plants in the hands of a superior management may lead indirectly to an interference with the autonomy of the component units on the technological side. Thus the general production program enforced by the central management may call for an apportionment of the aggregate output among the different plants in accordance with certain criteria, such as location or the adaptability of the equipment, or for a regulation of the current output of the various units in accordance with changing market conditions. In their expansion and reconstruction plans the production managers of the separate plants are always dependent upon the grant of capital by the superior management of the concern. It is significant that in the United States Steel Corporation, one of the largest concerns in the world, the most important decisions are vested in the financial committee.

As a legal entity the concern appears in a great many different forms. The device of a single firm with the individual plants as subordinate departments is not generally used. The only notable case of this type is the gigantic German chemical concern, the I. G. Farbenindustrie. The holding company arrangement is more frequently used, particularly in the United States. A holding company does not legally own any plants, but it holds the shares of capital stock of the formally independent manufacturing enterprises, which continue to operate under their old firm names. Sometimes, as in the cases of the German steel combine and of the Siemens-Schuckert concern, the situation is reversed. Shares of capital stock of the concern which represents the individual plants in deal-

ings with the outside world are owned by the managements of these plants so that they are transformed from manufacturing organizations into holding companies. Not infrequently the concern has no separate legal embodiment, the commercial unification of the individual plants being achieved through a mutual exchange of shares of capital stock. The Standard Oil concern at the present time is a good example of this form. A concern is also sometimes formed by a single person, as in the case of the old Hugo Stinnes concern in Germany; or by a small group of people, like the Rockefeller group in the older Standard Oil concern, who own the requisite number of shares of the individual plants and are bound by a gentleman's agreement to pursue a common policy in the general meetings of stockholders or in the sessions of the boards of directors and of similar controlling bodies. There exist also a number of intermediate legal forms. For example, a manufacturing company which has secured financial control of a number of other manufacturing plants, and has thereby become the headquarters of a concern, may in its turn come under the control of a single capitalist who purchased a sufficiently large number of shares of the parent organization. This is the structure of the Hugo Stinnes metallurgical concern, which still survives as a component part of the German steel combine.

The development of the concern is facilitated by the use of the corporate form of organization, particularly in those countries where it is legal to issue no-par value stock based on good will only and to limit the voting privileges to stock of this class. Experience in all countries has shown that in order to control the general meeting of stockholders and through it the management of the corporation it is not necessary to own even a majority of the stock and certainly not all the shares outstanding. Therefore a comparatively small amount of capital will generally suffice to secure control of the individual plants and thus to organize a concern. Even the control of the parent company of a concern does not require a large capital investment, when outside funds can be obtained in exchange for non-voting preferred stock or bonds. Through the organization of a concern the promoters may even increase the fluid funds at their disposal, if they succeed in selling to the public at however low a price that portion of the voting stock which is not necessary for the retention of control. When the concern is organized in such a way that the individual plants are controlled not directly by

the parent holding company, but by a number of intermediate companies, the risk of capital investment for the promoters is minimized and attractive opportunities are created for the earning of large profits on the flotation of the various classes of stocks.

The multiplicity of concerns in the United States is due in no small part to the fact that legal devices make it possible to secure and to retain a controlling interest in a large number of enterprises with a comparatively small capital outlay. The concern, while it is not the typical form of industrial organization in America, is the typically American form of combination. Combinations in that country do not long remain at the merger stage with its inherent limitations of scope, and cartels are known in only a few branches of industry. The concern seems best adapted to the law of the land and the psychology of the business man; for the underlying scheme of financial controls does not readily appear on the surface, and a holding company comes in many cases close to the ideal of the biggest company in its particular field.

In other countries concerns are far less numerous. The poor receptivity of the English investment market to domestic industrials acts as a brake upon the organization in England of corporations in general and of concerns in particular. Still the English prefer the holding company to the cartel, because the latter conflicts with the common law and judicial precedent. In Germany the law and the organization of financial markets are favorable to an unimpeded establishment of corporations, but the issue of stock without par value is illegal. In respect to number of concerns Germany therefore occupies an intermediate position between England and the United States.

In the cartel entirely independent enterprises are bound by mutual contractual agreements merely to follow certain procedures in clearly defined fields and with reference to clearly specified products. The detailed specification of even these procedures is left to later negotiations in which the members participate as equals and which can come to a successful conclusion only by unanimous agreement rather than by a majority vote. Since the members preserve their independence, cartel agreements are concluded only for a specified term and in the majority of cases for a comparatively short time. Each member, therefore, attempts by increasing the capacity of his plants to strengthen his position in the future negotiations for the renewal of the

agreement. A situation is thus created which is entirely inconceivable in a concern, where the expansion of the individual plants is subject to the control of the central management. While the manager of an individual plant in a concern is merely an employee subject to discharge for disobeying orders, the member of a cartel is a full fledged partner who even in the most rigidly organized cartels is liable only to penal damages and who may therefore freely violate the agreement if he finds it to his advantage to do so. Conflicts of interests which can never be definitively settled by a compromise may therefore persist for a long time in a cartel while in a concern unified management makes such conflicts impossible even though it leaves room for strong personal antagonisms.

Cartels which create a special body to supervise the execution of the agreement by the members must be distinguished from the looser type of cartel organization, in which such supervision is left to the watchfulness of the members themselves. In cartels of the first type the controlling organ may be independently incorporated and assume the functions of a sales agency, or syndicate, for the products subject to the cartel restrictions. Since they possess separate organizations which embody the "cartel idea" and which in some cases enter into direct relations with the market, such cartels may go to far greater lengths in imposing restrictions upon the members and are not easily broken up. Such cartels make possible an indirect interference with the production policies of the individual members, as a member's output may be limited to a definitely set maximum or to a definite proportion of the aggregate output of the membership. The regulation of production, however, applies only to the products subject to the agreement, does not in the majority of cases limit production for the member's own use and under no circumstances extends to such matters as plant organization and the type of manufacturing processes employed. It is possible, therefore, even in the most closely organized cartels for a member to evade regulation by expanding the output for his own use and by reorganizing the production machinery in such a way as to emphasize products not subject to the cartel agreement.

This situation is met by general cartels (*Mantelkartell*), which attempt to regulate the output of entire groups of products. Such cartels set for their members quotas of raw material to be used and leave to a number of special cartels

or to the discretion of the individual members the distribution of the raw material among the various possible uses; that is, the determination of the quantity of different semifinished and finished products to be manufactured. This does away with the opportunity for members to juggle with the output for their own use. When the special cartels function as syndicates dealing in all important semifinished and finished products, the degree of organization achieved by the industry is such that so far as the market is concerned competition among the producers is entirely eliminated.

There are few general cartels of this type even in Germany. For example, there exists no cartel comprising all the German coal fields, and the question of production for a member's own use has never been settled even in the Rhenish-Westphalian Coal Syndicate, a cartel which has been held up as a model to the entire world. Even simple syndicates dealing with one product or a closely knit group of products are comparatively rare in Germany. They are found only in a few branches of industry, which are organized on the basis of highly developed mass production and in which the fundamental conditions favored the creation of cartels. Neither in the coal and lignite industry nor in the heavy chemical and iron and steel industries are there syndicates for all the essential products and by-products. Thus the Rhenish-Westphalian syndicate is limited to the Ruhr coal basin and does not regulate the disposal of by-products of coking. The syndicates in other industries deal only with single products and not with the entire range of products manufactured by their members. Nor have any of the quality production lines been touched by the more rigid forms of cartelization. It is therefore inaccurate to speak of syndicates as characteristic of German industry.

While quota cartels which maintain a separate organization but not a sales agency are found in many different industries, by far the largest number of marketing combinations in Germany are loose associations, in which members agree merely to maintain certain minimum prices or to limit their sales to certain territories or to observe certain terms of sale, e.g. terms of payment, discounts. Such cartels are apt to fail at the crucial moment, when market conditions get out of hand. Even these loose cartels by no means dominate industrial organization in the classic land of cartels. The number of German cartels—2000 to 3000 according to various

estimates—appears comparatively small when account is taken of the immense variety of products manufactured by modern German industry.

It is true, however, that the characteristically German form of combination is the cartel rather than the concern or the trust. The cartel movement began early in German mass production industries and is to this day typical of these branches of manufacture. In some of them the organization of concerns, which began even earlier, was accelerated in the beginning of the twentieth century so that on the eve of the World War leading men of affairs held that industry had left the cartel stage behind. Later experience showed, however, that this was a hasty generalization. While in some industries concerns attained a very strong position and intensified group conflicts within the syndicates, the concern cannot be said to have superseded the cartel in Germany.

In the United States cartels and cartel-like associations are often found side by side with concerns. Owing to antimonopoly legislation and to the peculiarities of business psychology these cartels are in the majority of cases very loose associations indeed. There are no syndicates in the domestic market, nor have syndicates taken root among exporters since the passage of permissive legislation. The more numerous open price associations exercise no compulsion over their members and can bring about a uniform price policy only by indirect means. In bringing the producers together they may facilitate the adoption of informal agreements; essentially, however, they resemble not so much regular cartels as associations supplying information on current technological and market developments.

In England the law attempts to enforce competition and the producer is more concerned with the technology of manufacture than with its commercial aspects. Conditions favor, therefore, neither the concern nor the cartel. In the coal industry, for example, the peculiarities of English mining law and the shallow depths at which coal can be mined work against the formation of cartels. The fact that in many places coal can be mined by a small gang of workers without an appreciable capital outlay makes it difficult even for large operations to maintain a steady production and sales policy. Still, loose price agreements are sometimes employed in many English industries to dull the edge of the competitive struggle.

In France the prevalent type of combination is a loose form of price agreement, the so-called *comptoirs*. There is in French industry a marked emphasis on quality production, which attempts to take account of individual differences in consumers' tastes and which does not allow for regulation of production from the outside. Nor is the outlook of the average French producer conducive to closer cooperation. He is generally satisfied with slow progress within the traditional framework and does not easily rise to an understanding of the common problems of his particular branch of industry. Mass production industries in which concerns, like Schneider-Creusot, existed even before the war were until recently of limited importance. The coal mines of the north and the iron foundries of French Lorraine were operated by too large a number of producers to permit of effective action even by the *comptoirs*. After the war, with the reconstruction in the north and the acquisition from Germany of smelting and steel works in Lorraine, of Alsatian potash mines and of the patents of German chemical industry, an impetus was given to the formation of large concerns, which turned eventually, owing in part to government pressure, into closely organized cartels.

In the international field cartels based on division of territory become effective even when they comprise the producers of only several countries, particularly if they are aided by the tariffs of these countries. Price agreements are distinctly less common, and the closer forms of combination occur merely as isolated exceptions. Similarly, it is very unusual for an international cartel to include even the more important producers in all countries. It is significant that the international crude steel cartel (*Internationale Rohstahl Gemeinschaft*) did not succeed in inducing such important steel producing countries as England and the United States to join, and that despite strong efforts made to bring about closer cooperation it remains merely a division-of-territory cartel. The disorganization of the world economy, which is reflected in enormous unemployment in all industrial countries, has not been corrected by international cartels or concerns. They have not succeeded in reestablishing even the territorial industrial specialization, so unplanned and yet so systematic, which was an important factor in the smooth development of international economic relations before the war.

Combinations do not dominate the organiza-

tion of industry nor that of agriculture, commerce and transport. Neither is it possible at present to discern a general tendency in this direction. Is this due merely to the fact that modern industry is still in its teens or is the true situation such that the forces stimulating and retarding the development of combinations are in the long run evenly balanced? Is the relationship of the three factors which determine the form of business organization—technology, position in the market and the outlook of the entrepreneur—such that a tendency to combination must eventually reassert itself?

In the early period of mechanization the purchase of raw materials and the sale of manufactured goods still followed the methods of the handicraft period, and international trade had not yet adapted itself to the mass output of machine industry. Under these conditions the introduction of the mechanical loom, dependent for its economic operation upon a steady supply of yarn, forced cotton weaving mills to combine with spinning mills. This was necessary in order to avoid the constant adaptation of looms to new qualities of yarn, with the ensuing losses in time, wasted material and lowered quality of product. The technical efficiency of the new machines could be maximized only if the unevenness of the yarn were eliminated; that is, if the early stages of the production process were adapted to the later stages. Since commerce was still dominated by the spirit of the handicraft era and the merchant figured in industry merely as the organizer of enterprises on the putting out system, no change was likely to occur in the relations between the industrial enterprises and the market. The producers using machine methods were forced to devote themselves primarily to technological problems, even in those cases where vertical combinations had already been formed.

For this reason the older mergers did not survive the early stages of modern industrial development. With the progressive adaptation of international commerce to its new task and the parallel improvement of technical methods in all stages of manufacture this type of combination lost its *raison d'être*. Henceforth the factory owners and managers could concentrate their capital and attention upon technical improvements or upon the enlargement of individual plants instead of attempting to bring under single control several stages of manufacture.

The exigencies of technology are of similar significance at present in the quality production

industries, which work for a clearly defined market demanding goods of uniformly high quality irrespective of cost. In many of these industries the materials used must be so uniform in quality that however great care is taken in purchasing the result is apt to prove unsatisfactory. In such cases the manufacturer of the final product must undertake the organization of the preceding stages of production, sometimes going as far back as the cultivation or extraction of the primary raw material. When the demand for the high quality semifinished product depends upon the demand for the final product, technical deficiencies in production at the last stages may have a detrimental effect upon the manufacturers of semifinished products; in this case the situation is reversed and vertical integration follows the line from semifinished to finished goods. In either case the horizontal combination may be added to the vertical: several semifinished products may be equally important in the manufacture of the final products or one semifinished product may yield several varieties of finished goods.

Another factor leading to combinations in quality production industries is the desire to preserve the secrecy of manufacturing processes. The less effective the patent legislation in protecting the interests of the inventor, particularly in foreign countries, the stronger is the influence of this factor. In such cases combination often abandons the route from raw material to finished product, and the manufacture of complex specialized machines is combined with the lines of production using these machines. In such combinations the experience of the user is utilized in the machine construction plant and the improvements resulting therefrom are not shared with competitors. The secret process may also consist of a particular way of handling the material in several successive stages. An important illustration of this type of combination is found in the aniline dye industry, which manufactures also drugs and perfumes; its technical innovations are patented only in part.

Where the achievement of high quality is connected with considerable outlay for experimentation and the maintenance of expensive laboratories, a strong stimulus is given to combination. The benefit derived from combination in such cases is not merely the reduction in unit costs owing to the increase in commercial output; the laboratories are more useful when they can base their work upon the experience of several plants, and the results yielded by chem-

ical and physical research can often be utilized in manufacturing processes of several different types. Although a monopoly can always command sufficiently high prices to pay the cost of research, it is to the advantage even of the monopolist to keep costs and prices low and thus create a wider market for his product.

Combination in quality product industries also creates opportunities for the reduction of costs through the resulting changes in the sales department. Unlike semifinished products and raw materials the demand for high quality consumers' goods must be cultivated and in part even created; they compete not only with similar products of other manufacturers but with the entire range of convenience and luxury goods. Products of this type must therefore be distributed by an apparatus extensive in scope and carefully planned in detail, such as is found in specialized and localized trade. In some cases, however, the proper commercial handling of the product requires so specialized a knowledge of its technical properties that the producer is led to build up an apparatus of his own for its distribution. This is subsequently reflected in the field of production because selling costs per unit are reduced as a greater variety of articles is handled. All the important marketing costs, especially the tremendous expenditure for elaborate high class advertising, exercise under these conditions a pressure toward further combination in the field of production.

Combination in quality production is, however, more narrowly limited by the personal factor than is combination in mass production industries. Even the most careful organization of an enterprise does not sufficiently assure the precise compliance of every lot of goods and of each single article with the specifications. Where such compliance is a really important consideration, the work of each shop must be under the continuous personal supervision of the central management, so that the scope of possible combinations is rather limited. For instance, even in chemical manufactures not organized on a mass production basis, where in view of the exact nature of the processes employed the human element seems to be reduced to a minimum, matters like the adjustment and maintenance of required temperatures and the preparation of chemical solutions require a high degree of care on the part of everyone, which is attainable only if personal contacts are established between the plant management and the employees and also between the managements of the individual

plants and the central management of the combination. Continuous personal contacts between the management and the employees are also essential in the fashion industries and in machine shops in which instruments are made to individual order.

In industries working for a rapidly shifting demand combination is retarded also by the fact that the management must keep in constant touch with the market and make proper adjustments in the plant in anticipation of changes. There is thus no sufficiently stable base for expansion. Nor is vertical combination particularly expedient. The financial risks borne by such enterprises are so high that they must pass on a part of them to the manufacturers in the lower stages of production by keeping a free hand in the purchase of materials.

The peculiarities of the market for the finished product are largely responsible for the persistence of single proprietorships and partnerships in quality production industries. Corporations are not numerous; and concerns, which are in fact pools for the distribution of risks, are of slight importance, many of them dissolving after a few years of unsuccessful experimentation. Similarly there are but few closely organized cartels. They are not needed because the competitive struggle proceeds in the main on the level of quality competition rather than of price competition. Moreover, cartels are not particularly useful to the producer because they limit competition in one product only and do not affect the entire range of other goods competing for the purchasing power of the consumer. There exist, however, loose associations limiting themselves to the regulation of marketing conditions; yet even these regulations can be easily evaded during a crisis because there is so great a variety of grades and qualities. It is significant in this connection that recently the German Federal Economic Council (*Reichswirtschaftsrat*) raised the question whether cartel agreements which are not observed in fact should be made legally unenforceable.

Thus conditions in quality production industries do not favor the development of extensive and enduring combinations. In order to appreciate the full significance of this conclusion it must be borne in mind that the trend of the times points toward an increasing emphasis on quality goods, that differentiation and specialization of demand are coming to be characteristic not only of European countries but also of America and that quality production industries

are therefore bound to gain in importance in the economic structure of the civilized peoples.

The situation is quite different in mass production industries. Deep seam mining, the heavy iron and steel industry, large scale machine shops, the electric equipment industry, the manufactures of aniline dyes, explosives and artificial silk, the cotton and jute industries, the newsprint and wrapping paper industry and similar mass production manufactures are peculiarly appropriate for the formation of combinations and the development of the combination movement.

Combination in these industries offers particularly wide opportunities for changes in the technical organization of production. As the quality of product confers no immediate competitive advantage, reduction of cost becomes the watchword in plant organization. The productive capacity of the technical apparatus, which represents large fixed investments in machinery, must therefore be made as great as market demand will allow. If market conditions are unfavorable to an increase of output, some advantage at least can be derived by utilizing the power plant to the utmost to extend manufacturing operations to lower or higher stages of the production process in some cases and to production of other articles based on the same raw material in others. The utilization of waste has recently become especially significant; it leads often to an incorporation of new manufacturing processes in the framework of the old plant, particularly where the new operations are linked directly to the old. The larger the mass production enterprise, the more frequent is the establishment of laboratories and research organizations to check and improve the performance of the individual plants. The high cost of such scientific aids leads to a grouping under one management of many scientifically related manufacturing processes.

In so far as the interest of the enterprise in the market is limited to an attempt to keep costs at a minimum, mass production industries do not differ essentially from those enterprises engaged in quality production which operate on a large scale. Where reduction in costs is the only motive, combinations, even in mass production industries, remain fairly limited in extent, as in England. On the other hand, where a combination is organized to modify the relationship with the market it becomes wide in scope and enormous in size. When the combination aims at independence of the market it may extend to

include the entire production cycle from raw material to finished product. Where control of the market is the goal, the combination may grow to include all the plants in a certain branch of industry. In either case the form of combination is more likely to be the concern or the cartel than the simple merger.

The reason for such extensive combinations is found in the profound and otherwise irreconcilable contradiction between the rationale of production as a technological process and the conditions under which the output must be sold. This contradiction becomes the more pronounced the greater the reliance upon fixed capital investment induced by increasing technological rationalization. Fixed capital in large enterprises calls for an unchanging product to be sold at a stable price. This is due not only to the large proportion of the fixed charges but also to the exigencies of large scale organization, which cannot be easily adapted to changing conditions and which thus "fixes" even the variable portion of the costs of production. The markets for mass products, however, are not inherently stable; they are governed by competition, often international in scope, and exhibit continual fluctuations in the quantities of goods demanded and the prices at which they are wanted. Since no change is possible in the technique of production, the situation can be corrected only by an organization designed to neutralize or even to eliminate these fluctuations.

The presence of large quantities of fixed capital stimulates combination in another way also. In contrast to industries with small overhead costs, in mass production industries the complete elimination of economically weak competitors is not easily attainable. Even when they are thrown into bankruptcy their plants continue to operate, the only result being a reorganization in the financial structure and an ensuing change in the basis of cost calculation. Competition in the market thus fails to adjust supply to demand and does not offer the stronger producers the opportunity to recoup the losses incurred in the competitive struggle. Experience has taught the mass production industries to avoid price wars and to look for other ways of adjusting the market to the needs of production.

Independence of the market is sought mainly through the organization of vertical combinations. The production of raw material is combined with its refinement in the largest possible number of production stages. The combination does not then have to rely upon the market for

purchases, and its dependence upon the market is limited to the disposal of the final product. In none of its plants does the market price appear as a factor in the determination of costs, and hence production costs can be kept stable. Nor need the costs at each successive stage of production be tested in the market, since the profit or loss is determined by the margin between total cost and the sales price of the final product. Such a combination also derives a certain advantage from the fact that the market price of a product is likely to be the more stable the further it is removed from the raw material or semi-finished stage.

A horizontal combination may also afford some independence of the market. When it is introduced in the higher stages of production of a vertical combine, the enterprise profits by the fact that even in the case of goods based on the same raw material the price fluctuations are likely to be distributed more evenly as to range and time of occurrence where a number of different articles are involved. A purely horizontal combination offers similar advantages: individual price fluctuations are likely to offset one another if a wide range of commodities is dealt in. Moreover, a horizontal combination can adjust its production policy to increase the output of money making articles at the expense of less profitable lines.

The true aim of a horizontal combination is the control of the market rather than independence of the market. It attempts to unite under a single management competing plants manufacturing the same commodity as well as all the potential productive forces in that field. Even when control is not fully achieved and competition continues to rule the market, a horizontal combination offers the advantage of better adaptation to existing market conditions: production is concentrated in lower cost plants and the losses accruing from the shutting down of other plants are more than offset by the reduction in unit costs incident to the operation of the better equipped or more advantageously situated plants at full capacity.

The cartel is the classical device used by producers to control the market, but such control is scarcely ever fully achieved even by this means. The most closely organized syndicate must perforce leave a marginal field where competition prevails; this marginal competition delimits the area dominated by the syndicate and affects its policy. In the majority of cases the cartels cannot go beyond a rather slight

mitigation of the competitive struggle. And yet a price war and the grievous losses which it entails in industries with large fixed capital investments can be avoided only by combination. Karl Marx was right beyond doubt in insisting that a tendency toward monopoly is inherent in modern technology. From this point of view all loosely organized cartels are the forerunners of more rigid forms of combination. Although the area controlled and extent of control exercised must in many cases remain limited, even cartels allow hope for a certain degree of market stabilization.

Closely organized cartels stimulate further combination by their members. By attaching to its enterprise plants operating on the higher stages of the production process the strong member hopes to achieve a certain freedom from the regulations limiting it in the cartelized stage. Such combinations react, progressively higher stages of production as the cartels move further along the series of production stages. It is illuminating, for instance, that a large part of coal mined in the world today is sold by the coal producers in the form of gas and electric energy. A similar stimulus is given by the cartel to horizontal combinations. Stronger members acquire control of weaker enterprises in order to add the latter's quota to the output of their own plants and thus reduce unit costs.

Not the least important factor in the combination movement is the personality of the industrialist. Since considerations of a quantitative nature are of primary importance in individual plants and even more so in combinations of plants, it is not surprising that even the leading personalities think in numerical terms, are seized with a *rage du nombre*. In an age when the technology of mass production is organized on a scientific basis and the results of scientific research are available to each enterprise, the superiority of the stronger competitor cannot be tangibly expressed otherwise than in terms of larger output and larger capital investment. Interest in the technology of production, which must perforce concentrate on individual processes, cannot preoccupy the industrial leader whose prime vocation is the business coordination of plants employing different techniques. Even in enterprises operating on a single stage of the mass production process the tone is set not by technical expertness but by commercial shrewdness, whatever formal position the possessor of this faculty may hold.

Similarly, it is the employment of numerical

devices that makes it possible for a human being to direct a large organization. A numerical survey of conditions in each department of production and of the existing relations with customers is invaluable for a quick sizing up of the situation by the central management. The performance of numerous departments can be compared in the quiet of the director's office. It is no accident that the most advanced forms of accounting and production statistics are developed in the United States, where the emphasis on figures is particularly great owing in part to the standardization of consumers' tastes. Office technique becomes increasingly adapted to the needs of mass production and combination.

Cartels also stimulate further combinations by their members through their influence on the personal side of business management. Where a cartel is closely organized, the owners of the individual enterprises are more or less relieved of the necessity to watch the market for their product and to make proper adjustments in their production policies. What little work of this type is left can be safely delegated to unimportant subordinates. The leading men in the enterprise are then free to concentrate their attention upon the improvement of the structure of the enterprise and upon its relation to the higher, lower or parallel stages of production.

If it is true that in the mass production industries a number of important factors encourage combination in all its forms, the reason that such combinations have rarely achieved the final goal, the monopolistic control of the market, must be found in the existence of equally serious obstacles to success. In fact, as combinations extend beyond a certain point they meet with a series of resistances, in material and personal factors, which cannot be overcome.

Combination reaches the lowest limit of practicability where the emphasis shifts from the quantity to the quality of the output and the manufactured article is being adapted to the specialized needs of individual consumers. No matter how great the advantages which may be derived from the fuller utilization of the power plant or the greater adaptability to conditions in the market, they cannot offset the disadvantages which would result in such industries from the lack of a close control over technical performance in each operation and of a personal contact between the manager and the employee. While combinations may be formed in which the mass production enterprises manufacturing the materials for the quality industries will attempt to

annex plants in the quality lines, such combinations are not very likely to occur. In order to carry a sizable part of their output through the further stages of production, enterprises manufacturing the semifinished product would have to resort to mass production methods in the higher stages where quality is important, and would thus endanger the salability of the final product. Nor would a vertical combination directed toward the lower production stages be undertaken by quality product enterprises, if competition prevails in these lower stages. A combination of this type would run the risk of producing its materials at a cost in excess of the price charged in the open market, particularly when competition is so severe as to bring about the financial reorganization of many weaker enterprises in the lower stages with the ensuing reduction of costs and selling prices.

The personal factors which retard the growth of combinations are the limits to organizing ability inherent in human nature and the desire for independence, which is particularly strong in enterprises owned for generations by one family. Concerns allow more independence to the managers of the individual plants and permit their central managements to concentrate more upon the really vital questions than do mergers; for this reason they are able to acquire and maintain control of a much larger number of plants than straight consolidations. For the same reason cartels enjoy similar advantages over concerns.

It is not to be inferred, however, that a concern can expand indefinitely. The ability of the concern management to supervise the entire enterprise is still somewhat limited. A precise knowledge of the technological potentialities and the commercial contacts of each member plant is essential, and the lack of it may prove fatal in deciding important questions. Nor do the concerns leave enough freedom to the more independent spirits among the managers of the individual plants. If no room is found for them in the councils of the central management they are apt to leave the concern and organize competing enterprises of their own. The concern is then in danger of having the ranks of its subordinate managers filled with second rate bureaucrats. On the other hand, if independent spirits remain in subordinate positions in the concern, a serious difficulty is encountered in establishing co-operative relations between them and their superiors, who are themselves likely to be strong willed and extremely self-confident.

While the cartels are not similarly handicapped they encounter obstacles in other directions. In the first place it is difficult to describe products, particularly finished goods, with such precision as to make them the subjects of legally binding cartel agreements. For example, there does not yet exist an internationally acceptable definition of steel. Also the conditions in the plants of the various cartel members must be similar lest stronger members be tempted to break away and launch into competition with weaker. This is the chief obstacle to interregional and international cartels of raw material producers. The business organizations of the cartel members must also be similar in order to avoid group conflicts within the cartel. The demands made upon the cartel by the members enjoying certain advantages in equipment or location, and by members who control the production of materials used in the manufacture of the cartelized article, are likely to be quite different from those made by members not enjoying similar advantages. While the solution of this problem may be found in the purchase by the stronger members of the plants and quotas of their weaker colleagues, even a cartel composed entirely of strong members cannot eliminate the possibility of the appearance of outside competition due to the development of hitherto unused productive potentialities. This danger is present, for instance, even in the field of mining because there still exist undiscovered and untapped mineral deposits. It is much greater in the manufacture of semifinished and finished products, where technical innovations may bring forward substitute goods manufactured by different processes and based on a different raw material.

Thus the formation of combinations and the extent of their development are conditioned by the interplay of stimulating and retarding forces. In the post-war period combination in all its forms seems to have progressed far beyond the point reached before the war. It is certain, however, that this is merely a temporary phenomenon caused by a shortage of capital, the accumulation of which was interrupted for nearly a decade by the war and the disturbances consequent to it. The fact that at present, after years of persistent effort, there is still but a slight degree of international regulation in the world market suggests that at least for the near future competition will remain the supreme regulating principle in the world economy.

COMENIUS, JOHN AMOS (Komensky) (1592-1670), Bohemian educational reformer and theologian. Like his father Comenius was a member of the religious sect known as the Moravian Brethren. His earliest efforts in the realm of educational reform after his graduation from the University of Herborn in 1612 were directed toward improving the schools of the brethren, first at Prerau, where he became rector of the *Gymnasium* in 1614 and later at Fulneck, where he served as pastor and school superintendent from 1618 to 1621. As a result of the religious persecution accompanying the Thirty Years War he was eventually forced to flee from Moravia and to take refuge at Lissa, Poland. While devoting himself to the religious and secular education of the brethren at Lissa he elaborated his theories of education and composed numerous textbooks embodying his ideas. It was during these years also that he became obsessed by pansophism, a scheme to eliminate the religious and international dissensions of the world through scientific research and the universalization of knowledge. His plan, outlined in *Conatium comenianorum praeludia*, attracted the attention of the English reformer Samuel Hartlib, who secured an invitation for Comenius to lay his plan before Parliament. Chelsea Col-

lege had been practically selected as the seat of the Pansophic College when the civil war broke out and prevented further action. Bitterly disappointed, Comenius attempted to put his project into effect in Sweden, but soon discovered that his patron, Ludwig de Geer, was interested only in his textbooks and not in pansophism. In 1647 he was appointed bishop of the brethren and ten years later settled in Holland. During his last years mystical tendencies, which had never been less than dormant in his nature, became more apparent and produced a corresponding decline of his influence.

Although pansophism was the *ignis fatuus* of Comenius' career, his reputation rests on his reformed textbooks and on his writings dealing with the practical organization of schools. In the composition of these works he was guided by two fundamental principles, that all instruction should be carefully graded and that in so far as possible the teacher should appeal to the faculties of sense perception. He shared the tendency of his age to assign primary importance to the study of Latin but believed that it should be taught as a language of reality and not of books. His famous *Janua linguarum reserata*, which was translated into most European tongues and became almost a universal textbook, his *Vestibulum*, intended as an easy introduction to the *Janua*, and his *Orbis sensualium pictus*, the earliest illustrated textbook to enjoy a wide circulation, were all composed with the twofold object of imparting instruction in the language and of providing a compendium of useful knowledge. Comenius' most important contribution to educational theory was the *Didactica magna*, completed in Czech in 1632 and in Latin in 1638. In this work he presented a complete educational ladder, beginning with a school of infancy and ending with advanced research institutions, a scheme modern in its breadth and insight. Some of his views on early instruction received further elaboration in his *Schola infantiae*, which was composed primarily as a manual for parents. He also wrote a number of treatises on philosophical and theological subjects, and several historical accounts of the Moravians.

COMITADJI. The Turkish word *comitadji*, meaning committee man or supporter of the committee, is applied to members of the Macedonian Committee, which is more properly known as the Interior Macedonian Revolutionary Organization. This organization, founded in 1893 by a group of young Macedonian school teachers under the leadership of Damian Gruev and Gotze Delchev, had as its original program popular agitation designed ultimately to force recognition by Turkey of a limited Macedonian autonomy as guaranteed by Article XXIII of the Treaty of Berlin. Although from the beginning membership in the organization was open to all Macedonians—whether they belonged to the Serbian, Greek, Rumanian, Turkish, Jewish or Bulgarian racial groups—the actual direction of affairs tended to center in the hands of a revolutionary majority composed of Bulgars. So effectively were secret methods maintained that it was not until 1901, as a result of the seizure of the organization's archives in Salonika and the subsequent arrest of practically all the leaders, that the neighboring countries of Greece, Serbia and Bulgaria became aware of the serious threat of Macedonian autonomy which, if attained, would collide squarely with their expansionist ambitions.

Each of these countries, intensely suspicious of one another and having in common only a hatred of Turkey, maintained an active propaganda among its particular group within Macedonia; each fostered its own language, schools and churches, hoping thereby to establish a claim for future annexation following the anticipated liberation of Macedonia from the Turkish yoke. Greece, through its church, organized filibustering bands which by a campaign of terrorism should counteract the influence of the local Macedonian agitators. Serbia's government, nourishing dreams of a Greater Serbia, likewise sought to nullify the movement for Macedonian autonomy.

The most effective pressure of this kind was exerted, however, by Bulgaria, whose racial affinity with the Macedonians was closer than that of the other countries. Bulgaria, freed by the Treaty of San Stefano (1878) from Turkish domination and awarded generous boundaries which included Macedonia, in spite of her protests had been forced to accept the reversal of diplomatic policy represented by the Treaty of Berlin, which restored Macedonia to Turkey.

Also there was in Bulgaria a large body of immigrant Macedonians who had fled from Turkish persecutions. These refugees organized political societies whose leaders established, more or less with the support of government officials who were also in many cases Macedonian immigrants, the Supreme Macedo-Adrianople Committee under the leadership first of Boris Sarafov and later of General Tsonchev. In 1902 bands of young Macedonians, led principally by Bulgarian army officers of Macedonian birth, were sent across the frontier to stir up revolutionary activities against the Turks. The raiders, to their surprise, found themselves confronted not by Turkish soldiers alone, but by the organized forces of the Interior Macedonian Revolutionary Organization, which thus for the first time actively repudiated the Bulgarian expansionist movement and which was now engaged in the slow task of arming and disciplining a revolutionary force within Macedonia which should eventually be strong enough to assert itself. Tsonchev's raids brought no results, but the leaders of the Interior Organization, fearing further activities from this direction, were compelled to precipitate a general uprising the following year (1903), though not fully prepared for it. It was, of course, crushed by Turkish military force, but at least it succeeded in bringing about European intervention.

The reforms promised by the sultan in response to the European intervention were, as usual, not forthcoming. On the contrary, most severe retribution for the insurrection was dealt out to the Macedonians. The Revolutionary Organization was now definitely known to the world as a power and as the sole representative of Macedonian aspirations. Expansionist activity in Sofia dwindled. Russia brought pressure to bear upon the Bulgarian government, forcing it to suppress Tsonchev's Supreme Committee in Sofia. The raids were abandoned and Sarafov went so far as to accept, although with some mental reservations, membership in the Macedonian organization. Serbian and Greek bands were driven back against their frontiers, although for a number of years afterwards there was almost continuous skirmishing between them and the comitadjis. Against the expansionist activities of these countries the organization in its proclamation of 1903 committed itself categorically: "Our work . . . is superior to all national and racial prejudices. We accept as brothers all who suffer under the yoke of the sultan."

During the next five years the organization attained its fullest development. In 1906 a general congress finally ratified a constitution and a definitely outlined policy for the future guidance of the members. The slogans "Macedonia for the Macedonians" and "Evolution, not Revolution" were run as standing matter on the front page of the official organ, edited by Yavorov, Macedonia's foremost poet. Its program included agitation for autonomy, under Turkish rule or under a Balkan federation, and opposition to the expansionist activities of the neighboring states. A broad, non-Marxian socialism was, as it still is, the underlying philosophy of the movement. Organization was on a democratic basis. The local committee, elected by universal suffrage, sent a delegate to the *rayon* committee. Above this was the *okrug* committee, covering a territory corresponding to the *vilayet*. From the *okrug* committees came the forty-seven delegates to the regular general congresses, which elected and vested with executive authority the Central Committee of three members. There was another body, known as the *Zadgranitchno Predstavitelstvo* (Beyond-the-frontier representatives), appointed by the Central Committee, which represented the organization to all outsiders; it purchased arms, ammunition and other supplies and arranged channels for smuggling them into Macedonia. In

matters of particular importance it acted in an advisory capacity to the Central Committee. In no case was authority ever delegated to single persons; hence the significance of the word *comitadji*.

Meanwhile conditions forced the organization to assume functions additional to those implied in its name. The Turkish administrative system, although not unduly oppressive, as the Macedonians have since learned by comparison, failed completely to provide law and order. The Macedonian committees, therefore, took on the functions of courts. Brigandage, which had been rife, was suppressed. In those districts assigned to the spiritual administration of the Greek church, where non-Greek schools were forbidden, "outpost" schools were established, the children taking turns on outpost duty, to warn the teachers of the approach of strangers. The *chetas*, or military bands, which during the early days of the organization had been developed under the authority of the *rayon* committees, enforced the decrees of the courts. To support them, in case of emergency, were the secret village militia bodies, with hidden arms. The beys, Turkish and Albanian landowners, were next brought into line. They were invited to discuss wages, and the large majority found it not only advisable but profitable to do so. Not a few of these beys became loyal members of committees. Tons of literature were printed—much of it propaganda, of course, but a considerable portion consisting of pamphlets on strawberry raising, grape culture, cattle breeding and the like. Such were the activities carried on between the frequent irruptive periods of skirmishing and warfare, during which the *chetas* resumed their military operations. The organization was literally an underground government functioning beneath the outer husk of the legal Turkish rule.

The Young Turk uprising in 1908 brought into power a group with whom the Macedonian organization shared at least a desire for a constitutional Turkey. When the Young Turks raised their flag in Ressen in southern Macedonia, the organization was with them. When the Young Turk army battered down the gates of Stambul to depose 'Abdul-Hamid II, a *cheta* marched in the vanguard, headed by Yani Sandansky, an outstanding Macedonian comitadji. The Young Turks, however, overwhelmed by the more reactionary elements from Asia Minor, failed to bring about the expected reforms in Turkey's Balkan policy and the movement for armed resistance became increasingly strong.

When in 1912 the three rivals, Bulgaria, Greece and Serbia, decided on joint action against Turkey, the Macedonian organization enlisted as a fourth member of the alliance. Within a short time the Turkish Empire in Europe was destroyed and Turkish domination in Macedonia was at last ended. There is the feeling to this day that in this first Balkan war the comitadjis were deceived, even by their kinsmen in Bulgaria, for throughout they believed they were fighting for an autonomous Macedonia. Instead, the victorious nations began to quarrel among themselves over the partition of Macedonia. The second Balkan war, for which the Macedonian organization was primarily responsible, resulted in a crushing defeat for Bulgaria and in the extension of Greek and Serbian influence in Macedonia. The alliance of Bulgaria and Macedonia with the Central Powers in the World War was another bid for recovery, and here too the Macedonians swung the balance. The Greater Bulgarian movement again suffered a severe check. Bulgars in large numbers emigrated from Macedonia to Bulgaria and created a floating population conducive to the spread of violence.

The Interior Macedonian Revolutionary Organization was revived in 1920 by Todor Alexandrov and the Central Committee was re-established. Never was it more alive than today; never has it caused greater worry to the minds of European diplomats. Its strength and influence would undoubtedly be greater were it not for the internal broils which shake its solidarity. First it was Sarafov who after becoming a member attempted to revive the Greater Bulgaria propaganda. For this he was killed. In 1924 it was Soviet gold; Moscow offered financial aid and in the quarrel over whether this should be accepted Alexandrov was killed, although his, the anti-Bolshevik, side finally won. In 1928 it was the old pre-war issue—autonomy or union with Bulgaria. Macedonians who had held commands in the Bulgarian army during the wars had penetrated the organization. But their leader, General Alexander Protoguerov, was killed. The old idea, Macedonia for the Macedonians, triumphed. The cause of these dissensions may probably be found in the democratic basis of the organization, encouraging, as it does, the formation of parties. The members of the Central Committee in 1929 were Ivan Michailov, a graduate of a Serbian high school in Macedonia, later law student in Sofia University; Strahil Razvigorov, a lawyer; and Ivan Karadjov, a

professor of history. The military element has been eliminated.

COMITY. With various refinements of meaning the term comity has become established as a legal concept in the conflict of laws, constitutional law and international law.

In the conflict of laws, or private international law, comity has acquired a rather technical meaning and has been the subject of much controversy. The fundamental theoretical problem in the conflict of laws has been concerned with the process by which principles derived from foreign law are given effect in the decision of cases adjudicated locally. Dutch jurists in the seventeenth century—notably Joannes Voet (1647-1713) and Ulricus Huber (1635-94)—conceived that foreign law is actually given effect locally and that the extent of its application depends upon comity. Huber elaborated three propositions, often repeated, which are in substance as follows: first, that the laws of each state have force only within the territory of that state; second, that all persons found within a state, whether their residence is permanent or temporary, are considered subjects of that state; third, that by comity the laws applied in any state are given like effect in other states, provided there is no prejudice to other states or their subjects.

Huber's maxims were accepted and elaborated

in Story's *Commentaries on the Conflict of Laws* (Boston), first published in 1834. Story concluded that there was "not only no impropriety in the use of the phrase 'comity of nations,' but it is the most appropriate phrase to express the true foundation and extent of the obligation of the laws of one nation within the territories of another" (§ 38). While the maxims of Huber were reproduced also by Wheaton and were countenanced later by Holland, it was chiefly through Story that the theory of comity advanced by the Dutch school found its way into and largely influenced the development of English and American law. Delivering the opinion of the United States Supreme Court in a famous case, Chief Justice Taney declared: "The comity thus extended to other nations is no impeachment of sovereignty. It is the voluntary act of the nation by which it is offered; and is inadmissible when contrary to its policy, or prejudicial to its interests. But it contributes so largely to promote justice between individuals, and to produce a friendly intercourse between the sovereignties to which they belong, that courts of justice have continually acted upon it, as a part of the voluntary law of nations" [*Bank of Augusta v. Earle*, 38 U. S. 519 (1839) citing Story, *Conflict of Laws*, § 37]. In another leading case the United States Supreme Court decided that since foreign judgments were given effect only on grounds of comity there was no occasion for giving effect to the judgments of French courts in the absence of reciprocity. Four dissenting justices maintained, however, that interests acquired under foreign laws were given recognition as a matter of right [*Hilton v. Guyot*, 159 U. S. 113 (1895)].

The theory of comity in the conflict of laws has been vigorously criticized. Increasingly the conviction has spread that courts do not give extraterritorial effect to foreign laws as matter of comity or grace, but that they are bound by their own rules of the conflicts of laws or by international law, which is said to be a part of their own law, to accord recognition and protection to foreign created rights. The acute mind of Lorimer penetrated the fallacies of the doctrine and denounced the so-called *comitas gentium* as an "old woman's fable"; Dicey saw in it only "idle logomachy"; Goodrich has branded it as "a slippery term"; Westlake suggested that it "had better be dropped"; and Kuhn has anticipated its "complete abandonment." There are, indeed, many indications that the theory is losing ground, where it once flourished, in the decisions

of English and American courts. Among European jurists, who have always been more critical of the maxims of Huber, the theory of comity has been even more generally repudiated.

In the constitutional law of a federal state such as the United States comity has been interpreted to mean legally in substance what it means etymologically. For example, the United States Supreme Court has, as a matter of comity, declined to review the decision of a state commission until the complaining party has availed himself of the appeal to the state courts which the local law provides [*Prentiss v. Atlantic Coast Line*, 211 U. S. 210 (1908)]. On grounds of comity, likewise, United States federal courts in one circuit may follow the decisions rendered in another circuit although not bound legally to do so [*Mast, Foos & Co. v. Stover Mfg. Co.*, 177 U. S. 485 (1900)]. On similar grounds United States federal courts usually accept the interpretation of a state statute or constitution which has been adopted by the courts of the state concerned [*Burgess v. Seligman*, 107 U. S. 20 (1882)]. And conflicts in jurisdiction between state and federal courts or between federal courts of concurrent jurisdiction have frequently been resolved upon principles of comity [*Covell v. Heyman*, 111 U. S. 176 (1883)].

In public international law the notion of comity (*comitas gentium*, *convenance et courtoisie internationale*, *Staatengunst*) is generally invoked to explain such practices as are more or less consistently observed, although not considered as having the quality of legally binding customs. Thus comity is a factor which influences the growth of international law; and usages based on comity are sources from which law may be expected to develop. Despagne distinguishes usages based on comity from rules of international morality on the one hand, upon the ground that observance of such usages is conditioned on reciprocity, and from rules of international law on the other hand, upon the ground that non-observance of such usages gives rise to no rights of reparation. Matters of ceremonial, the extradition of fugitives in the absence of treaty, the immunities of foreign merchant ships in port in the absence of treaty [*Wildenhuis's Case*, 120 U. S. 1 (1886)] and consideration for the interests of other countries in deporting paupers and criminals have been said to rest on comity. Since public international law is the law of an imperfectly organized society it is frequently difficult to distinguish practices based on comity from those based on obligation.

The immunities of foreign merchant ships in port, for example, are founded upon comity, in the absence of treaty, according to the Anglo-American view, while according to the French view they are founded upon legal obligation. It is noteworthy that certain practices referred to as comity by earlier writers are regarded by contemporary writers as conforming to legally binding custom. It may be anticipated that many of the practices now founded on comity will eventually become legally binding custom.

COMMENTATORS. The commentators were a school of jurists which arose in the second half of the thirteenth century in France and Italy. The school derived its name from its method of treating the Roman texts. Since it succeeded the school of the glossators it is also sometimes known as the school of the post-glossators. Again, its expositors are often called Bartolists after the name of its greatest master.

The school of the commentators, which arose at a time when Accursius was still in his ascendancy, represented a strong reaction against the gloss. The glossators had been inspired by a double purpose: to discover the exact meaning of the Roman texts and to introduce into mediaeval practice the pure Roman law embodied in those texts. But not only was it impossible to apply the Justinian law in its integrity to mediaeval conditions of life, as the writings of the later glossators bear witness, but the great gloss of Accursius, treated as an infallible authority, had in fact supplanted the Roman texts. The new juristic movement inaugurated by the commentators represented a demand for

greater independence in legal thought and practise and called for a new synthesis to develop the law in harmony with mediaeval conditions. It arose in France where during the twelfth and the first half of the thirteenth century the exegetical method of the Italian glossators had been adopted by a certain number of French civilians and canonists. Jacques de Revigny (Jacobus de Ravanis), philosopher and theologian, professor at Toulouse and later at Orléans, may be considered the founder of the commentators. He applied to the law the method which Thomas Aquinas had used in theology, the dialectics of scholasticism, and in France he was followed by many disciples, notably Pierre de Belleperche (Petrus de Bellapertica), likewise professor at Toulouse and Orléans, who died in 1308. The great reputation of these French jurists awakened an interest among the jurists of Italy. Cino da Pistoia (*q.v.*) came to France to study the new method, and it was he who introduced it into Italian legal study. Bartolus of Sassoferrato (*q.v.*), unquestionably the greatest and most influential of the commentators, studied under Cino. Baldus de Ubaldis (*q.v.*), the pupil of Bartolus, was the most distinguished of all his successors. Among other commentators of note were Albericus of Rosate (d. 1354), Bartholomew Salicetus (1330-1412), Paul of Castro (d. 1441), Raphael Fulgosius (1367-1427), Paulus de Imola, Philippus Decius and Jason de Maino.

Applying their dialectical method to the Roman texts the commentators sought to extract from them principles and theories that would meet the needs of contemporary practise. As distinguished from the glossators, who had accumulated a vast number of *casus*, many of which were unrelated to one another, the commentators endeavored by the processes of logic to deduce from general principles all the corollaries which they contained; they thus aimed at the production of methodical expositions, with divisions and subdivisions. Their work was essentially constructive, as opposed to the glossators' labor of interpretation. Although they were not seeking to free the pure Roman law from the gloss they created legal systems based in large measure on the Roman law. But while they drew many elements from the Roman legal system they gave full consideration to mediaeval legal sources, such as city statutes, Germanic and feudal customs and the rules and principles of canon law. Bartolus, for example, used custom and statute not merely as illustrations but as parts of his elaboration of a system of law which,

while based on Roman law, was to have practical application in the Italian courts of his own day.

The commentators developed many ingenious and fruitful theories both juridical and political, useful in the later Middle Ages and also in modern times, as, for example, the theory of personal and real statutes established by Bartolus. Although derived in part from Roman texts these theories were essentially mediaeval in character, being based upon isolated texts or fragments which were frequently misunderstood or given a meaning different from their original signification in Roman law. The legal and political thought of Bartolus and also of most of the other commentators reflected and interpreted Italian conditions of their own time. Although they derived many elements of their thought from the writings of the glossators and canonists, the commentators adopted, modified or expanded the theories of the earlier jurists. Thus Bartolus elaborated the theory of juristic personality which the glossators and the canonists had originated. The influence of the ideas of Bartolus may be further illustrated by his doctrine in regard to the binding force of Roman law. To Bartolus it was still essentially the emperor's law, but he separated obedience to the emperor's laws from recognition of the emperor himself, holding that obedience to the Roman law was not dependent upon recognition of the Roman emperor. In the later Middle Ages and during the age of the Renaissance this idea of the universal validity of Roman law as *jus commune* lay at the basis of many of the processes of adopting Roman law throughout Europe.

The great achievement of the commentators was the transformation of the Roman law into a mediaeval Italian law. They created a literature on Romano-Italian law which not only possessed authority in Italy itself but played a role of great importance in the legal and political life of Europe as a whole. The preeminence of Bartolus in the school is marked by the professional maxim that no one was a jurist who was not a Bartolist (*nemo iurista nisi sit Bartolista*); and, indeed, not only in Italy but also in many other parts of Europe the opinions of the great commentator, some of which have preserved their validity to the present day, were held to be the law itself. The scholastic method elaborated by Bartolus and his school, known as the *mos italicus*, exerted a far reaching influence and was adopted in other European countries, notably in Germany. Indeed, it was the Romano-Italian law of the commentators which crossed the

Aips into Germany in the period of the reception. Even into the sixteenth century, despite the protest of early Renaissance writers, the lawyers proceeded on the lines developed by Bartolus and his school, whose work was largely continued by the "practical jurists," who for their own age further adapted Roman legal materials to the needs of daily practise in the courts.

But the eager pursuit by the commentators of their ideal to solve all problems by a painstaking and elaborate logic unquestionably led many members of the school to absurd refinements. Boccaccio's remark that in the hands of the commentators law had ceased to be a science was a criticism far too severe, but there was, nevertheless, much truth in the sentence which Cujas passed upon the school as a whole: *verbosi in re facili, in difficile muti, in angusta diffusi*. A great mass of books written in a harsh crude style, a mass which would have made, it has been said, *multorum camelorum onus*, issued forth as the result of their labors. Once again, as in the similar case of the Accursian gloss, the texts of the pure Roman law were now buried beneath mediaeval dialectical exercises. Teachers, practitioners and judges came to do little more than cite authorities by name and treatise, and as a result there arose the doctrine of *communis opinio*, the doctrine that the sound juristic view was that which had the greater number of supporters in the books. Thus the new life given to legal studies by the work of the early commentators was followed by a period of stagnation.

During the fifteenth century, while the Bartolists were still in the ascendancy, humanism created a new movement in Italian legal studies. Classical scholars and poets, notably Lorenzo Valla (d. 1457), Pomponius Leto (1428-98) and Angelo Politian (1454-96), devoted their learning and skill to an enthusiastic study of the Roman legal texts. They aimed to restore the Roman law of the classical jurists as the basis of the Justinian codification and later legal growth, seeking through the help of history and philosophy to infuse legal research with the spirit of new and enlightened tendencies and to give to law itself a true scientific foundation. The work of the fifteenth century humanists was carried on by one of the most famous of all the Renaissance jurists, Andrea Alciati (*q.v.*), a Milanese professor who more than any other humanist personified the new school of legal thought which had arisen as a reaction against the Bartolists. Alciati transplanted to France the aims and methods of the science he had learned and

taught in Italy; while in France Jacques Cujas (*q.v.*) brought the work of the school to its highest perfection. The Renaissance jurists, notably Alciati and Cujas, used in general the historical method, but other French jurists of the school, especially Douaren (*q.v.*) and Doneau (*q.v.*), applied another method, the synthetic and dogmatic, in studying the Roman texts.

The aims of the commentators were fundamentally different from those of the other two schools. While the Bartolists strove to formulate a mediaeval Italian law, both the glossators and the Renaissance jurists represented a revival of ancient Roman law. The dialectical method of the commentators also differed fundamentally from the interpretative method followed by the glossators and also from the historical method of Cujas and other sixteenth century jurists; but, on the other hand, there was an affinity between the dialectical method of the Bartolists and the dogmatic method, suffused by logic, of Doneau and the jurists who followed his example. In yet another respect, that of system, there was similarity between the Bartolists and Doneau; but while the Bartolists, using an analytical-exegetical method, wrote treatises on mediaeval law Doneau employed the processes of natural synthesis to reconstruct the legal system of ancient Rome. The great French school of the sixteenth century exercised an extensive influence upon the whole world. That influence was, however, largely of a scientific and educational character; on the practise of the courts it left an imprint of far lesser significance. In Germany the courts remained faithful to Bartolus and in France to the doctrines of the school of Jacques de Revigny and Bartolus; indeed, Dumoulin (*q.v.*), the last of the great Bartolists, wielded on practise a far greater influence than Cujas.

COMMERCE. Many a reader has smiled over the passage in the third book of the *Odyssey* where Nestor converses with Telemachus. After lavishing on Telemachus all the hospitality due to a stranger the old man observes that the time has come to ask him who he is and turning to him he asks whether he is a trader or a sea robber, much as he might have asked him whether he was a painter or a musician. Yet there is nothing odd in the question, for the chief merchants of the sea at that time were the Phoenicians and they were also the chief pirates. And in the history of the world the two pursuits have often been combined. It is only within the last hundred years that slaves have ceased to be a recognized article of commerce, and when it is lawful to seize and sell men and women the commerce that depends on bargaining and the commerce that depends on brute force are not easily distinguishable. When Delos was the great commercial center of the Mediterranean world that little island was also the chief slave market. So late as the end of the eighteenth century a British or French ship arriving on the Gold Coast would have prompted the question that Nestor put to Telemachus. From the earliest to comparatively modern times the peoples through whose hands international trade has passed have been partly merchants and partly robbers.

The sea has been a more lawless element in history than the land in the sense that the state which became its master could exercise a wider sway than any land empire. In the ancient world the danger of a sudden surprise by pirates or enemies from the sea led to an avoidance of exposed sites. Readers of Cicero's *De republica* will recollect his praise of the founder of Rome for choosing a site that was not on the sea but in touch with it. Commerce has been chiefly associated in the progress of mankind with this more lawless element, with this more ungoverned power, and in consequence has had throughout most of history a warlike rather than a peaceful aspect. It was the aim of enlightened teachers like Adam Smith to show that commerce need not be what it had generally been—a cause of rivalry and of war, or the reward of

naval power—and that when once men understood their true interests commerce would become a great force for peace.

This view of commerce as a civilizing force is natural because commerce begins where civilization begins. In the earliest phase of civilization we find peoples enriched by special conditions of climate and able to use water communications for creating contact with their neighbors. Civilization began in this way in Mesopotamia and Egypt. The Tigris, the Euphrates and the Nile were the source of the wealth and culture of Sumerians, Babylonians, Assyrians, Egyptians—the peoples who were the first to write and to make beautiful objects. This world is the cradle of commerce. For commerce is not merely exchange between individuals but between tribes or peoples as well. It implies, therefore, the existence of a certain surplus of wealth and a certain provision for communication.

In this phase of what may be referred to as river civilization there were two outstanding centers of culture, Mesopotamia and Egypt, both of them exporting and receiving products. The rich character of the civilization created by the Sumerians somewhere about 4000 B.C. and the wide range of their relations with the rest of the world are only now being brought to light. Babylonia we can picture in early days as a great market where the world's produce was collected and distributed, carried by river or on the back of man or ass. These products included corn, dates, wool and woven garments, all of which Babylonia exported in return for wines, olive oil, timber, bitumen, stone, spices and drugs. These two centers were surrounded by great tracts of desert and grassland, across which those products were carried just as modern products are carried across the sea. The place taken in this type of economy by the Venetians or the Dutch in early modern times and by the British in the nineteenth century was taken in the ancient East by the Arab nomads; the place of the ship was taken by the caravan. The great desert of Arabia is like the sea. To cross it you must know where are the wells, what are the landmarks, where there is

danger. The only people who know these secrets are the native nomads, who are in touch with the peoples living on all sides of the deserts. In this way the Arab became the great carrier of the East. He organized caravans, set up bazaars and formed desert cities, sometimes at places where the desert touches a river as at Deir, or the sea as at Suakin. And the Arab was half brigand, half trader.

Even in the days when Mesopotamia and Egypt were the great powers the sea began to be important. The Sumerians had ships on the Euphrates and Tigris which reached the sea: Eridu was then at the head of the Persian Gulf. But the development of the new form of commerce fell to other peoples. The Cretans, of whose exploits, like those of the Sumerians, we have learned only in quite modern times, inaugurated a new phase in the life of the world—the phase in which the Mediterranean becomes the source of wealth and power. The pottery and textile manufactures, the sculpture and painting, the gem and ivory work, the metal and inlaid work, all the remarkable treasures left behind speak of a culture spread over the Aegean and a commerce that brought Cyprus, Egypt, Sardinia, Mycenae and the Hellespont into touch with one another. The Cretan age, which began somewhere about 2500 B.C. and lasted till the sack of Knossos about a thousand years later, was followed by the rise of the Phoenicians. The Phoenicians were Semites with all the special gifts of their race. The Semites discovered or invented numerals, arithmetic and algebra; it was from their sense for numbers and counting that they derived their idea of justice so prominent in the Old Testament. But the Phoenicians had in addition the gifts that made them the pioneers of method in business, the spirit of adventure that made them explorers. They began by setting up trading cities on the edge of the sea at Acre, Tyre and Sidon, just as the Arabs set up trading cities on the edge of the desert. From these they sent out settlements, which gave them harbors in Sicily, Sardinia and Africa. Carthage, founded by Tyre before 800 B.C., eclipsed the fame and power of the original Phoenician cities. In her great days Carthage had a land trade with central Africa; sold negro slaves, ivory, metals, precious stones to all the Mediterranean peoples; worked copper mines in Spain and sent out ships that coasted along Portugal and France in quest of tin. For four centuries the Phoenicians monopolized the sea commerce of the world. At first they received

the gold and precious stones and spices of Asia from Arab caravans, but afterward they crossed the Isthmus of Suez, entered the Persian Gulf and visited the coast of India. Thus there was continual exchange of the products of the East and those of the Mediterranean countries; corn and linen from Egypt, wines from Italy and Greece, slaves from Africa, gold and spices from Asia and Arabia, all passed through the hands of these brilliant traders. Tin was brought across Gaul and iron from Lorraine and Burgundy. Exchange on this scale would not have been possible of course if people had still used as their medium of exchange cattle or tripods or slaves. Money had come into use first in Asia. We hear of gold coin minted by Croesus in the sixth century B.C., but there may have been metal money earlier. The Carthaginians used leather money.

The Phoenicians were the chief traders in the Mediterranean. But they soon had rivals in the Greeks: first the Ionian cities of Asia Minor, then the cities of the Greek mainland. The Greeks opened up the Black Sea trade and drove the Phoenicians out of the Aegean and Ionian seas. In the West they spread settlements in Sicily and Italy, while Massilia (Marseille), founded on the coast of Gaul, gave them for a time access to the Spanish markets. But then Carthage and the Etruscans joined forces against them and in the sixth century they had to sign a treaty which left the Spanish markets to the Phoenicians. After the conquests of Alexander the Greeks developed trade over central Asia and India, and from the new port of Alexandria foodstuffs and manufactured goods from the Nile valley, Ethiopia, east Africa, Arabia and India were distributed over the Greek world and the West.

The Romans were less commercial in habit and instinct than the Phoenicians or the Greeks, but the establishment of the Roman Empire was an event of capital importance in the history of commerce. For the Romans succeeded where the Greeks had failed. The Greeks could not make a political unit of Greece; the Romans made a political unit which included not merely Italy or the Mediterranean, but a world that stretched deep into three continents. Over this world Roman law and administration created conditions more favorable to commerce than any that had existed. Government was liberal and strict; peace was less disturbed than it had been in the days when state was competing with state; piracy if not abolished was greatly reduced;

trade routes were made comparatively safe; roads were excellent; the Roman coinage impressed the Indians and Roman honesty the Chinese: there have been few moments in history when commerce looked less like a cause or a means of war. In the early empire the secrets of the monsoon were discovered and navigation of the eastern waters made much easier. There was consequently a great development of trade between East and West, all the trading genius of Greek and Syrian and Phoenician finding scope under the rule of Rome. Industrial production was developed and specialized, and with specialization came a development of the system of exchange. A map of the world in the second century of the empire would have shown ports all over the known world which received and exported goods under the protection of Rome: Gades in Spain, Bordeaux and Boulogne in Gaul, connecting Rome with the eastern coasts of Spain and the British Isles; Myos Hormos and Berenice connecting her with India and the Far East. The coasts of the Euxine and of the Aegean and Mediterranean were studded with Roman harbors. Metals were carried from Britain on one side, from the depths of Asia Minor on the other. Egypt sent flax and papyrus; Asia Minor and Illyricum hides; Africa and Syria timber; Gaul pottery, glass, leather, port; Greece marble; Syria perfumes; Pergamum parchment. Cloth stuffs dyed or embroidered came from Spain, Gaul, Asia Minor, Syria, Phoenicia and Egypt. The Baltic and Germany sent amber; Scythia corn, furs and precious stones; east Africa tortoise shell and ivory; China raw or manufactured silk. Slaves came from equatorial Africa, from India, from the plateau of Iran, from the Baltic. The Roman Empire included such various peoples and climates that it supplied most of its wants; from outside it imported luxuries such as silk, spices, perfumes and ivory, for which it paid for the most part in specie. For this trade shipowners in the different ports were combined in colleges and merchants in guilds. There were large numbers of Orientals in Rome representing eastern shipping agencies or mercantile houses. The first and second centuries of the Roman Empire have been compared in respect of the vigor of their commercial life with the age of the industrial revolution.

With the fall of the Roman Empire in the West this economic life came to an end, and the center of gravity shifted back to the East. Around Constantinople centered the trade

carried on by Greeks, but its importance was soon eclipsed by the renaissance of the Arabs after the rise of Islam, for this religious revival made the Arabs great soldiers and great traders. During their supremacy, which lasted through the seventh and eighth centuries, they divested the Byzantines of their most important commercial provinces in the East by the conquest of Syria, Mesopotamia, Persia and Egypt. Long before the time of Mohammed Mecca had been an important center of commerce for Arabs traveling between the Euphrates and the Yemen. With the new vitality infused by religious zeal the Arabs spread over a wide area, trading between China and the west of Asia. Arab traders visited China regularly and when the disturbances there at the end of the ninth century put an end to these direct relations, they established a depot in Malacca to which Chinese merchants resorted. Arabs traded in emeralds and elephant tusks between Egypt and India, by way of Aden. In the East their trade was partly a caravan trade. They had depots at Antioch, Trebizond and Alexandria, where they passed the spices and luxuries of the East into the hands of the Greeks, who took them to Europe. In the West after their conquest of Spain they had harbors at Cadiz, Malaga and Almeria. Their conquests in Spain and Sicily had lasting results for commerce, for they acclimatized eastern plants and introduced eastern industries. At first they were violent visitors, introducing Islam at the sword's point as well as bringing articles of commerce, but in the eleventh century their fanaticism declined and they were content to put trade first. At this time they had trading relations with the north of Europe; the Russian merchants had a quarter in Constantinople, and there was Arab money in Russia in the tenth century. Then this trade died out and Arab money became scarce. One reason was that the Russians had converted Bulgaria to Christianity, and the Arabs thus lost their Mohammedan link with the north.

In the eleventh century the Arabs were driven from Sicily by the Normans and the offensive in the wars of religion passed to the Christians. The crusades, the most dramatic episode in those wars, have as great an importance in the history of commerce as in the history of religion in that they brought back the old relationship between Europe and the East. There was one great difference, however, arising from the fact that Europe had been making a steady advance in the arts of commerce and production. Reli-

gion, with its use of beautiful brocades in cathedrals and monasteries, had given a great stimulus to commerce. And Europe had learnt from the East: from the Syrians, who were ready to brave every kind of danger in their zeal for business and settled in towns like Narbonne and Bordeaux where they mixed easily with the natives; and from the Arabs in Sicily. Just as the slaves brought by Sulla had taught Italy the scientific culture of vine and olive, so Europe was now learning new arts. The crusades gave a great impetus to this development. Venice, Genoa and other Italian cities had at this time become prosperous trading cities, and when the crusades were organized the accompanying fleets carrying munitions and food were furnished by these towns, which as a reward were given concessions in Syria and Palestine. In this way Venice, Pisa and Genoa acquired commercial colonies in such towns as Jerusalem, Antioch and Tyre. For the next three centuries there was fierce rivalry between these Italian towns, much like the rivalry of Athens and Corinth in the fifth century B.C. or that between the English, Dutch and French in the seventeenth century A.D. Venice gained the ascendancy in this competition because her naval power enabled her to obtain access to the markets of the Byzantine Empire. The Venetians had acquired in this way a trade connection that linked their commerce with the Black Sea and China on one side and Great Britain and the Flemish ports on the other. A large fleet protected by archers carried every year spices, silks, wine and raisins to the western ports, taking back at first hides, tin and wool and later manufactured cloth. During these centuries there was a great development of production. From the ports of Venice, Genoa, Barcelona, Montpellier, Narbonne, cloth manufactured in England, Flanders, France and Italy went regularly to the East. Cairo had a special market for western cloth and Lucca learned to rival Damascus in silk manufacture. Political strife, which has so often checked commerce, in this case proved a stimulus. For the arts and secrets of these textile manufactures were carried from town to town and from country to country by refugees and exiles.

Meanwhile the market for the goods brought to Europe from the East was extended northwards. In the twelfth century the port towns of Germany had organized to defend themselves against the piracies of the Swedes and Danes. From this there grew up the great league of the

Hanse towns, the most famous of which were Lübeck and Hamburg, with depots at Novgorod, London, Bergen and other places. Bruges was the meeting place of a great exchange of the raw materials of the Baltic and the wares of the Mediterranean, while the Rhine and the Danube were busy highways. In Venice large warehouses and offices were put at the disposition of German merchants, and merchants from Ratisbon, Nuremberg, Augsburg, Ulm, Constance, and from the provinces of Austria and the Rhineland did business there; there was a similar provision at Genoa. All this commercial development was accompanied and aided by the development of banking, an art invented by the Italians and improved by the Dutch.

Thus Europe had a vigorous commercial and industrial life in the fifteenth century. But three things happened in that century which brought a revolution into the life of commerce. In 1453 Constantinople fell to the Turks, in 1486 Dias rounded the Cape of Good Hope and in 1492 Columbus, looking for the Indies, stumbled on America. The first of these events threw the old economy into confusion. For the trade on which Venice and Genoa had grown rich was controlled and taxed by the Turks, who made themselves masters of Cairo and Alexandria half a century after the capture of Constantinople. The second and third events—the discoveries—gave to commerce a different balance and range and ultimately a different character.

A scholar describing the economy that came to an end with these events has compared the Europe of the Middle Ages tapping the wealth of the East through the Levant to a "giant fed through the chinks of a wall." The discovery of the Atlantic routes by reducing that chink to relative unimportance deprived of their advantage those trading peoples who had benefited by living near it. In the new economy, which placed a premium on access to ocean routes, no country was so favorably located as England. Hitherto she had been less important in the world of commerce than Italy, France, Spain or the Low Countries; her population in 1600 is estimated at 4,500,000 while the population of Venice at that time is believed to have been nearer to two millions than to one. But in the phase of the world's history ushered in by this new revolution England became eventually the leading commercial power. But that ascendancy was obtained only gradually after a series of wars in which trade was more directly a cause and a prize of war than ever before, covering three

centuries and resulting in the successive climination of Portugal, Spain, Holland and France.

The riches resulting from these discoveries were at first shared exclusively by Portugal and Spain. The famous Bull of Borgia, as issued by Pope Alexander VI in 1493 and as revised the following year by the conference at Tordesillas, awarded Portugal all new lands that might be discovered east of a "line of demarcation" drawn from pole to pole 370 leagues west of the Azores; while it gave to Spain all lands lying to the west of that line or, in modern terms, all of the Americas except the eastern part of Brazil.

To follow the history of commerce during the next three centuries it is convenient to observe this distinction between the East and America. What the explorers wanted in the fifteenth century was to find a new way to the East, and Columbus thought he had solved this problem when he saw in the distance the shores of America. The East was valuable as the source of spices and silks, which were articles of importance in the luxury trade of Europe. It was therefore a triumph for Portugal when she found herself possessed of a monopoly of the increasingly rich trade with the coasts of Africa, India and the many islands that lay beyond the Cape of Good Hope. For over half a century Portugal developed an empire of tremendous wealth. Then came a decline in her national strength and her annexation to Spain in 1581. The loss of Spanish maritime power that followed the destruction of the Armada constituted a death blow to Portugal's commercial empire. The Dutch eagerly took over the Portuguese islands and settlements and in 1602 formed an East India Company with its capital in Batavia.

The Dutch became the great trading power of the seventeenth century. But the era of commercial monopoly, as typified by Portugal in the East and Spain in the West, was over; commercial power was now a prize to be fought over and divided. The early clash over supremacy between the Dutch and the English was concentrated on the East. As the Dutch already held the Spice Islands, the English were forced to content themselves with trading stations in India. Within a brief period the French were similarly attracted by this Indian trade. Before the Europeans entered on this commerce India had been clothing a good part of southern Asia, sending calicoes, chintzes and fancy goods to Persia and muslim to different parts of Asia and to Egypt. The Indian export trade was in the

hands of Chinese, Japanese and Javanese merchants who formed settlements in the Indian ports. The Europeans who took their place in this economy likewise formed settlements and they extended this Indian trade. The Portuguese sent Indian clothing to Brazil, and the Dutch, English and French sent Indian goods to western Europe.

In the lands which lay to the west of the papal "line of demarcation" Spain established one of the richest empires of history. Spanish treasure fleets brought to Spain the gold of Mexico and the silver of Peru. While this wealth often fell into the hands of English, French or Dutch sea rovers, enough reached Spain to establish her dominance in Europe during the sixteenth century. Spain established a wide influence in the new world, to which Spaniards brought her religion, her laws, her customs and her language. The loss of her maritime power with the defeat of the Armada in 1588 did not affect this influence. She kept her empire intact down to the break up of the European empires in America in the nineteenth century. But she lost her chance of building up a great commerce because, eager as she was for wealth, she did not put commerce first or understand its needs. She did not put commerce first because politics and religion led her rulers into the pursuit of other ambitions. Her industries declined. The Spanish kings, borrowing from great houses like the Fuggers, went bankrupt from time to time and the Atlantic commerce was heavily taxed for the defense of the treasure ships that brought the bullion from America.

The rivals of Spain had a more adequate appreciation of commerce. The Dutch, the British and the French looked at the new world in fact through the eyes of commerce. The Dutch invented new methods of banking and of business to meet the new needs; the British copied their example. The French were slower, embarrassed by problems and ambitions from which the British as an island people were free. But all three peoples threw themselves into the struggle for commercial expansion, and as the ideas of the time taught that monopoly was the secret of success, the result was incessant strife.

In this manner the world passed into a new phase. The wars of religion ended with the Peace of Westphalia in 1648. The wars of economic nationalism, extending to the four corners of the earth, began with the war between the Dutch and the British in 1652. Commerce and war for a time were aspects of each other. Even

when governments were at peace their subjects were sometimes at war. Between 1748 and 1754 Great Britain and France were at peace, but a fierce war was in progress between the French and the British in India. Clive won some of his most brilliant victories when officially there was no war between the English and the French.

The great feature of the new commerce was the chartered commercial company. The cost and the risk of trading in distant seas demanded large capital and elaborate organization. In the past there had been powerful, and often conflicting, bodies like the Merchant Adventurers and the Hansatic League, who had enjoyed social privileges and had exercised a great influence on diplomacy. But the new chartered company was a much more powerful body. Not only was it given an exclusive right to trade with the inhabitants of a particular colony; it was given the right and duty of defending it. Great Britain, France, Holland, Denmark, Scotland and Prussia had each an East India company. Some were unimportant, but a company like the British East India Company, which ruled India down to the Sepoy Mutiny of 1857, was a new kind of great power. The struggle for ascendancy in India which lasted till the nineteenth century was largely a struggle between companies formed by the Dutch, the English and the French to develop their trade, backed by governments sometimes overtly, sometimes informally, at war with one another.

The decline of Holland's commercial power in the eighteenth century left Great Britain and France as the chief claimants of the commerce of the New World; their principal battlefields were India and America. By the end of the seventeenth century France held Canada and Louisiana, and Great Britain the whole of the east coast between Canada and the Spanish settlement in Florida. The English, French and Spanish shared the West Indian islands. The range and value of overseas commerce were enormously extended. The natives were helpless and the traders and settlers did not spare their weakness. America sent potatoes, tobacco, cocoa, rice, rum, dyewood, timber, furs, molasses, cane sugar, while Europe sent back manufactures, luxuries and slaves.

This last item was historically the most important of all and is an interesting index of England's mounting commercial prestige and power. The leading place in this trade fell naturally to the people who came to the front in the struggle for maritime supremacy. In the last

twenty years of the seventeenth century 300,000 slaves were transported from Africa in British ships. One of England's chief gains from the Treaty of Utrecht (1713) was the clause which made her the chief slave trading nation of the world. The Dutch, then the French and after 1713 the British were given the monopoly in the supply of slaves to the Spanish colonies.

The type of colony founded by Spain, France and Great Britain in America was a settlement of colonists living its own life as a community, making the colony their home. Such a colony resembled the Greek type except that it was still under the government of the mother country. But a colony might also be a place held by a small population or a garrison, valued simply for the wealth and trade that it brought to its owners. Most of the acquisitions in the East at this time were of this latter type. When the Portuguese lost such a possession to the Dutch, or the Dutch to the English, they lost everything. But colonies of the other kind were spread over America, settlements where Spaniards, Britons and Frenchmen made their homes. In the British settlements the colonists were often immigrants who had left their mother country to escape oppression or intolerance.

To the most vigorous European peoples of the time commerce was the source of power and colonies the source of commerce. "I state to you the importance of America," said Chatham, "it is a double market: a market of consumption and a market of supply." Holding this view British governments valued the West Indies more than the colonies on the continent. When an issue arose on which the sugar colonies and the mainland colonies had different interests, the sugar interests were strong enough to weigh the balance in their favor. In the bargaining preceding the Treaty of Paris of 1763 it was for some time doubtful whether Great Britain would not prefer Guadeloupe to Canada. European governments regarded their colonies as places to which they could send their manufactures and from which they could receive raw materials, and treated them accordingly, regulating their commerce in the interests of the mother country.

This shortsighted view was condemned by two of the wisest minds of the time, Turgot and Adam Smith. It brought a sensational nemesis. Colonies that were strongholds used for exploiting local resources often changed hands in the wars of the seventeenth century: in the Seven Years War, for example, France lost Canada, where a French population had made a home.

But this loss, like the loss of a Portuguese settlement in the East, was a result of the fortunes of war. In the latter half of the eighteenth century and the first half of the nineteenth European governments suffered heavy colonial losses from a new cause, namely, the discontent and eventual revolt induced among colonists by treatment received at the hands of the mother country. The first to suffer such loss was the nation that had been most successful in the pursuit of commercial success. In 1783 Great Britain lost thirteen of her American colonies.

The sequel is curious. The French, Spanish and Dutch seized the opportunity of attacking their rival. The consequences proved serious to England but more serious to the French and Dutch. The strain on French finance brought France to revolution, while the Dutch were severely damaged as a commercial people and the Dutch East India Company ruined. Consequently, when between 1811 and 1825 Spanish and Portuguese colonies, like Argentina, Chile, Colombia, Mexico, Peru and Brazil, broke away and set out as independent communities directing their own life, the British were far better able than the French or the Dutch to take advantage of the new markets and of the opportunity offered to European enterprise by the inability of the United States to supply all the capital or manufactures needed by South America.

Meanwhile, the loss of the thirteen colonies had not meant, as the British feared, the loss of all commerce with their inhabitants. In December, 1793, Jefferson, secretary of state, laid before President Washington an elaborate table on the foreign commerce of the United States which showed that although the French tariff was more favorable than the British, exports to Great Britain were twice as great as to France, and imports from Great Britain seven times greater than from France. These figures are all the more impressive from the fact that cotton, which twenty years later was to become the most important American export to Britain, did not figure on the list at all.

This table was drawn up at the beginning of a struggle between Great Britain and France which had a great effect on the commerce of the two peoples. By the end of the eighteenth century Great Britain had built up her strength as a commercial power dependent on her use of the sea. Napoleon resolved to strike at her trade and in 1806 issued his famous Berlin Decree excluding British goods from the continent. Great Britain, placed in a difficult position, was forced

to retaliate very cautiously in order to avoid difficulties with the neutrals, the chief of whom was the United States by virtue of the extreme rapid development of her carrying trade during the Napoleonic wars. Eventually the economic duel between Napoleon and Great Britain, growing fiercer and fiercer, almost ruined the British cotton industry and in 1812 brought Great Britain and the United States to war. It is significant that at one time Napoleon thought of trying to make the continent an economic unit, planning among other things the establishment of a cotton industry in Italy. Great Britain surviving this great strain, emerged from the Napoleonic wars relatively stronger than before. During the years from 1803 to 1814 she had lost about 40 percent of her ships, but on the continent, where the net effect of the struggle was a somewhat prolonged disablement, she had no close rival; while the United States, which as a result of rapid strides had come to be the second great carrying power, had only half of Great Britain's tonnage.

Thus the world had passed during the half century that followed the Declaration of Independence through a commercial revolution almost as important as that which had followed the discovery of the Atlantic routes. The great powers which had used the resources of America for their own benefit had all of them lost a great part of their possessions, and vigorous independent states had taken the place of the colonies governed by regulations from Europe. One of these states had already become the second carrying power, ready to take advantage of the opportunity created by the industrial revolution. The first phase of this revolution was the establishment of the textile factory industries. Down to this time the manufacture of cotton was an eastern industry; in the age of handicraft the Hindu with his delicate touch clothed most of southern Asia. By 1830 the manufacture of cotton had become, as the result of a spectacular achievement, a Lancashire industry, and Lancashire mills were sending out cotton goods to India and the China seas. Great Britain, using her paramount influence in India, placed heavy duties on Indian cottons and silks in the home market, while only a nominal duty was imposed on cotton goods entering India. In 1830 45,000,000 yards of cotton yarn were sent to India. In 1833 Great Britain was importing 300,000,000 pounds of cotton wool. And more than two thirds of this supply came from the United States.

The sensational growth of this American commerce was due to the invention by Whitney of the cotton gin, which made possible a vast development in the production of short stapled cotton. Up to that time the only cotton available for export had been the long fibered cotton known as sea island cotton, which grew in only a few specially favorable places. After Whitney's invention there was a tremendous increase in the export of cotton. In 1793 the quantity exported was under half a million pounds; in 1832 it was over 300,000,000 pounds. The carrying of all this raw material across the Atlantic created a great demand for shipping services. Raw cotton condensed into compact bales by the aid of a hydraulic press was brought from the Atlantic states to England for a halfpenny to five eighths of a penny per pound. This commercial development, like the discovery of America, was followed by a correspondingly great evil. Whitney's invention gave a powerful impetus to the slave trade by making the cultivation of cotton in the rich lands of the Mississippi valley immensely profitable.

The industrial revolution, then, in its first phase gave a great stimulus to commerce and particularly to the commerce of the new world. But this commerce is significant for an additional reason. Before the discovery of the Atlantic routes commerce had been mainly in luxuries; silks, spices, furs, camphor, cinnamon, pepper were the commodities that the Arabs carried overland and the Venetians overseas. Pepper and cinnamon were in great demand for food and medicine, because there were few vegetables for the table, little fresh meat in the winter, and the monotony of food and drink made condiments specially desirable. When only small ships were available there was no profit in carrying cargoes that had to be carried, if at all, in bulk. But nineteenth century commerce was largely a commerce in bulky goods—goods used by the mass of consumers. Without this change the industrial revolution would not have gone very far. There were two features of the industrial revolution without which it would have been comparatively limited in scope. One was mass production; clearly mass production demanded mass consumption. The other was specialization. There had been specialization in the days when Damascus made silks, Arezzo pottery and Toledo swords, but it now assumed a new form. Whereas formerly a district had supplied itself with necessities and had imported luxuries, now specialization extended to

necessaries, and Lancashire was clothing the poor of other countries and continents.

We can see another effect of this change in the history of the commerce in corn. Before the nineteenth century this commerce was checked by two difficulties. The first was the cost of transport: England, for example, could only import from the north of France, the Netherlands, Denmark or Germany. The second arose from the fact that conditions of climate were much the same over wide areas, and if a harvest failed in one country it often failed also in that from which corn might have been imported. There was indeed an important and sensational exception. In 1808 and 1809 England had bad harvests and France good harvests. Napoleon did not dare, or was unable, to prevent the French farmer from taking advantage of this situation, and thus England was fed by France in the fiercest moments of their struggle. Down to the days of industrial specialization most countries in so far as possible grew their own corn, and commerce in this commodity was on a restricted scale until the middle of the nineteenth century.

Conditions then changed. With large and swift ships it was possible to transport corn across the Atlantic from countries where the conditions of climate were different. Thus corn became a most important commodity for export—a development which was aided by what we may call roughly the revolution in land transport. In Great Britain the first industrial revolution was carried out before the railway age. The coal fields and the districts suitable for the spinning of cotton happened to lie near the ports. Canals and roads were made to connect them, and the Lancashire cotton industry was flourishing before the first railway. But in this respect Great Britain was peculiar, for in other countries the introduction of the railway preceded the industrial revolution, solving the problem of transport for the United States, Russia and Germany and paving the way for the great industrial development of these countries. In the United States in the second half of the nineteenth century the wheat raising districts of the middle western and western states were in this manner connected with the seaboard. Russia was enabled to get an outlet to the sea through Germany or by Odessa. The extent to which this revolution in transport changed the commerce of the world is indicated by a comparison of the imports of wheat into England before and afterwards. Before 1850 England could only obtain wheat from Odessa, or from

Poland and Prussia via Danzig. In 1905 she had cargoes from all parts of the world: in January from the Pacific coast of America, in February and March from Argentina, in April from Australia, in May, June and July from India, in July and August winter wheat from America, in September and October spring wheat from America and from Russia, in November from Canada. The effect of the revolution is that wheat, whether produced in England, Russia, Germany or the United States, fetches approximately the same price on the London or the Mannheim Corn Exchange. For corn, cotton, rubber, tea, sugar, the world is one market. Other perishable goods, such as meat and fruit, which had never before been carried about the world were similarly affected. By the end of the nineteenth century chilled or frozen meat was carried in enormous quantities from America and Australia to Europe.

Another consequence of the improvement of transport was the creation of great free trade areas. Although in one sense it is true that protectionist tariffs were a prominent feature of the nineteenth century, it must be remembered that the economic units were much greater than when Adam Smith wrote *The Wealth of Nations*. At that time the most considerable free trade area was Great Britain. One reason for the more rapid progress of Great Britain as a commercial power was this freedom from the restriction which hampered development in France until the revolution. In the eighteenth century Great Britain united in one area the finance of London, the commerce of Bristol and Liverpool, the industries of the textile north and the coal and iron of the Midlands. If Holland and Belgium had been united in one economic system the two states would have had the advantages Great Britain enjoyed. France had, in spite of the vain efforts of Vauban and Turgot to abolish them, local duties and internal customs down to the revolution. Until its unification in 1850 Italy consisted of eight states with eight tariff barriers. The creation of the modern national states changed all this. In the peculiar case of Germany economic unity preceded political. Under the inspiration of List, a Zollverein was formed which in 1833 included all the German states. However severe the national tariffs, goods traveled free over much wider areas in all parts of the world in the nineteenth century.

This freedom had an important bearing on another consequence of the improvement of transport, namely the neutralizing of many great

advantages of geographical position. Invention makes industry less and less dependent on immediate local conditions. The first spinning mills in England were located by the streams because, until the steam engine was invented, they depended on water power. In 1830 a German complained that it was impossible to develop a coal industry in Westphalia because the coal and iron were nearly fifty miles apart. But by the beginning of the twentieth century Germany's output of pig iron exceeded that of Great Britain. Meanwhile the great railway systems of Europe gave German industry access to the north Italian markets and to the port of Genoa, while the railway to Constantinople gave her access to the Levant. In the United States railways have connected the haematite ores of Lake Superior with the bituminous coal of Pittsburgh, making America the greatest producer of crude steel in the world.

The effect of railway development is seen in the great change that took place in the nineteenth century in the distribution of industrial power. After the Treaty of Vienna in 1815 Britain became the workshop of the world, a position which she kept for half a century during which industrial development on the continent was hindered by the wars that created the new Italy and the new Germany. Great Britain, having built her own railways, was busy building similar ones for other countries. But after the Franco-Prussian War and the American Civil War industrial development was rapid both in Europe and in the United States. This is made clear by the statistics for certain important exports.

TABLE I
EXPORTS OF PRINCIPAL COUNTRIES
1880-84 AND 1900-04
(In £1,000,000)

YEARS	GREAT BRITAIN	GERMANY	FRANCE	UNITED STATES
Manufactures				
1880-84	206.4	91.9	73.1	30.6
1900-04	224.7	154.2	94.6	99.8
Iron and steel				
1880-84	27.6	11.5	0.9	1.5
1900-04	33.3	22.8	3.8	10.7
Machinery				
1880-84	11.5	2.7	1.1	2.6
1900-04	19.5	10.1	2.3	14.7

Before the end of the century there were a great many workshops in the world, all of them representing powerful interests in finance, shipping and commerce as well as in industry. The attention of governments began to be occupied more and more with the task of finding employment for labor and capital. Commercial rivalry therefore took new forms. The great institution of the seventeenth century for the extension of commercial enterprise was the chartered company, the great institution of the nineteenth century was the trust or ring—the steel trust, the meat trust, the oil trust, the shipping trust, the money trust, the rubber trust. With the beginning of the twentieth century the most tempting openings for commercial enterprise were to be found in those parts of the world that were beginning to use railways or possessed resources awaiting development. A new rivalry began for concessions and spheres of influence in such countries as Turkey, China or Persia or for the control of tropical products that had suddenly become valuable. Diplomacy was more and more occupied with such prizes. Behind the jealousy and fears that produced a Triple Alliance and a Triple Entente were banking and financial houses more powerful than the Fuggers, and great trusts seeking special opportunities for penetration and influence.

When the World War came the commerce of the world was very different in character and scale from the commerce that was interrupted by the wars of the French Revolution. It was now a commerce in the goods consumed by the bulk of mankind. The conditions of shipping were also different. In the eighteenth century the trader was his own carrier; in the nineteenth shipping had become a separate service, carrying goods and persons at regular tariffs over regular routes. After the Napoleonic wars Great Britain and the United States were the two great carrying nations. Toward the end of the nineteenth century, under the influence of a more intense nationalism, the development of a national mercantile marine became an object of public policy. The French government set the example in the eighties and Germany, Italy, the United States and other less powerful peoples all gave encouragement in some form or other to their shipping interests. When the war broke out Great Britain was still the leading shipping nation but Germany had become a formidable competitor. Although, as a result of the war, competition from Germany was measurably decreased, that from the United States and Japan

became much more acute. The gains of the latter were inevitable, because under the pressure of necessity British ships were withdrawn from the more distant trade and Japan filled the gap.

Japan had begun to push ahead as an industrial power in the last twenty years of the nineteenth century. The war accelerated this process especially in the case of the textile industries. The general effect of the war was to reduce Europe's preponderant share in the commerce of the world, as is clear from Table II, which gives the percent share of various countries in the total exports of the world.

TABLE II
SHARE OF PRINCIPAL COUNTRIES IN WORLD EXPORTS,
1913 AND 1925
(In percent)

	1913	1925
United Kingdom	13.9	12.4
Germany	13.1	7.0
France	7.2	7.2
Belgium	3.8	2.3
Italy	2.6	2.4
Switzerland	1.4	1.3
Sweden	1.2	1.2
Russia	4.2	1.0
United States	13.3	16.0
Canada	2.4	4.4
Argentina	2.7	2.7
Brazil	1.7	1.7
India	4.2	4.8
Japan	1.7	3.0
China	1.6	2.2
Australia	2.0	2.5
South Africa	1.7	1.4
Other countries	21.3	26.5

Any survey shows what difficult problems commerce has put to the statesmanship of man. In one sense the problem was never harder. World exchange is now the basis of the economic life of almost every people, and that exchange, the commerce by which nations are enriched, is now the commerce by which they are fed and clothed. Mistakes in one part of the world bring calamities in others. Man by his ingenuity has created a mechanism so delicate and elaborate that the penalties of mishandling it are more disturbing to the peace and common life of man-

kind than the suspension or the destruction of the trade relations of the ancient or the mediaeval world. Raw materials, such as oil, which are badly needed and found in few places are the object of fierce rivalry or dangerous intrigue. Oil in this respect tends to occupy the place held by cotton in the struggle between England and France in the eighteenth century. At the same time it is easier now than then for a few interests to draw into their hands the control of resources that are vital to mankind. Moreover, the number of states in Europe has as a result of the war risen from twenty to twenty-seven, and 7000 miles of new tariff walls have been added.

Yet Cobden's view that commerce might be made the great force for friendship derives support from its checkered history. Commerce brought peoples together; spread over the ancient world the great Greek civilizing idea of city life; created common interests between enemies. The Hellenist kingdoms and the Roman Empire, with all their influence on the life and mind of man, were made possible partly by the relationships established by commerce and the penetration of distant countries by enterprising traders. Even the ancient world had commercial treaties. Greek traded with Phoenician; Saracen with Christian. Good faith was a commercial asset. The destruction of Carthage and of Corinth by the commercial selfishness of Rome was bitterly condemned by good Romans, and the Roman Empire owed its power to its escape from the views of the age of Cato.

In modern times, although organization is employed for protecting selfish or particularist interests, it is employed also for cooperation. There are 20,000 commercial treaties in force. Moreover, if there are more tariffs in Europe now than before the war, there is greater readiness to discuss and take common action. Important economic conferences have been held: at Brussels in 1920; at Genoa in 1922; and at Geneva in 1927. For the first time in history a collective convention in the sphere of tariffs has been signed in the Hides Agreement of July, 1928, whereby no prohibition is to be allowed on the export and import of hides, skin and bones. Under a commercial convention adopted in 1930 the leading European states have bound themselves not to denounce bilateral commercial treaties then in force before April 1, 1931, with a view to discussion of the best methods for the improvement by international agreement of the production and distribution of commodities. The sense of common interests, and of common dangers,

was never so strong as it is today and for the first time in history mankind has machinery that can be employed with effect.

COMMERCIAL GEOGRAPHY. See GEOGRAPHY.

COMMERCIAL LAW is generally defined as that part of the law of the land which is applicable to business transactions. The Anglo-American treatises on the subject are essentially texts on the law of contracts with supplementary chapters on agency, partnership, corporations and negotiable instruments. Some select for special treatment particular contracts concerning the principal commodities (real estate, goods and merchandise, intangibles), credit (suretyship, guaranty, mortgages, conditional sales) or services commercially rendered (carriage and other bailments, insurance, banking, public utilities). Other topics treated less often in the texts include pertinent aspects of the criminal law, particularly as it affects restraint of trade, fraud and unfair competition, or such phases of procedure as the administration of estates, bankruptcy and equitable relief. In fact, any subject in a digest of Anglo-American law is apt to have a bearing on some commercial transaction. There is no formal boundary between commercial and non-commercial persons, things or transactions. There is, however, such a boundary in the civil law of continental European countries, which is emphasized by the existence of separate codes of commerce side by side with the civil codes. Treatises on commercial law in these countries are therefore concerned in the first place with a careful drawing of the line of demarcation and then with a study of (1) the types of persons and associations involved in commercial law, (2) the subject matter of commerce, (3) the transactions and "obligations" within the purview of commercial law and (4) procedure in courts having commercial law jurisdiction. The more minute subdivisions, however, are not incommensurate with the topics of Anglo-American commercial law. Thus the first numbered heading includes agency, partnerships and corporations of various kinds and intercorporate relations; the second includes various types of property and particularly the intangibles embodied in negotiable and other documents; the third includes every variety of business transaction whether in the market, at the bank or on the exchange, whether for cash or for credit, whether pertaining to things or to services. Both the common law and civil law leave water transportation to be dealt with by maritime law, and air transportation is being rapidly assimilated to the latter rather than the former category.

Analytical attempts to justify either the Anglo-American system of merging business law

with the general law or the continental system of keeping them distinct have been not without merit. It is true, for example, that the merger accords well with the political theories that reached the height of their popularity in England and America in the seventeenth and eighteenth centuries. The recognition of a special merchant class seems to imply special privileges and class discrimination which are opposed to the idea of equality before the law. On the other hand, a generation ago in Germany when the proposed civil code was under discussion quite other views prevailed. It was successfully argued in favor of a separate commercial code that commerce was a thing allied to international civilization not to national culture; that accordingly it was desirable to ally its law to that of other countries so that it might be adjustable to the commerce of the world without either distorting or being distorted by the deep rooted civil law of the land; that commerce was essentially different from non-commercial transactions because it was impersonal and standardized and because it required speed and the utmost simplicity both for the making and enforcing of its arrangements. These arguments seemed to gain force from the fact that oriental countries found it possible to introduce the European codes of commerce although they were impervious to the civil codes. Yet the Swiss code merged the commercial and civil law, and Japan has built on the Swiss code. It is easy to overestimate the importance of the difference, but a unitary system does not exclude distinctions between commerce and other activities nor does a dual system exclude the interplay of influence between commercial and civil law. The explanation of the divergence is to be sought in history rather than logic.

Rome, the lawgiver, was a great commercial center, but Rome did not leave the world a system of commercial law. Its commerce although great was exceedingly simple. Disputes under it were decided among citizens according to the procedure of the *jus civile*; and in the case of foreigners from the surrounding Italian tribe states, who could lay no claim to rights under the sacred Roman law, the praetors judged their disputes in accord with such general principles as seemed natural because apparently common to all the tribes or nations—the so-called *jus gentium* which finally transformed the *jus civile* into the great system of Roman law which has come down to us. Of its adequacy for a simple commerce there can be no doubt.

That some of its *actiones* were made for purposes that we should call commercial (*actio institutoria* and *tributoria*) may be conceded. But the commerce reflected in this system is one that is conducted without the idea of "representation" by an agent, without effective association for business, without anything like the business corporation, even without documents of credit, to say nothing of negotiability. The household was looked upon as the all sufficient unit with slaves to do the work. It is perhaps characteristic of Roman thought about business that the seller was given protection against the buyer in a harsh bargain (*laesio enormis*) although no corresponding provision was made for the overreached buyer. This discrimination is understandable if the buying and selling were outside of the course of business and the desire to sell was to be explained normally by harsh necessity.

Thus the Roman law which Europe inherited was inadequate to the needs of its commerce. Moreover, since it was a formal written law it could maintain its integrity against the encroachments of mercantile custom, and the latter could develop only side by side with it as a supplementary body of customary law even though it sometimes borrowed Roman elements. The separation was encouraged by the lack of centralization in the systems of European courts, resulting in the mediaeval tendency toward the parallel development of several systems of law. Matters improved but little even after the disappearance of the personal system of law under which one was said to "live" a law—the Roman, the Lombard, etc. For a long time, as Voltaire remarked, the traveler changed territorial law as often as he changed horses. The church had a curious and extended jurisdiction, for the line between what is God's and what is Caesar's is a wavering one. In the battles over this shifting line and in the later struggle between the advocates of local laws and those of thoroughgoing Romanization the law merchant was an unimportant element. The canon law made its chief contribution to commercial law in the form of a strict prohibition of interest taking. Princes were more interested in taxing merchants than in ruling them. Feudal law was rural and particularly inhospitable to the intrusion of alien elements. When civil codes were finally drawn up there was little thought of including the law merchant.

For the origin of this mediaeval law merchant, as for the origin of commerce itself, we must

look not to the West but to the East, to the Greek speaking world and beyond to Babylonia. The Levant had some kinds of written obligations: "syngraphs" and "chirographs," as the Greek bankers called them; "shetar" was a Babylonian term brought into Europe through the Hebrew. Five centuries before the Christian era clay tablets of indebtedness were common on the busy boulevards of Babylon. Checks were used and documents were endorsed. Although all traces of the latter were buried for centuries, Talmudic law took their provisions for granted and the plausible suggestion has been ventured that Jewish merchants may have introduced the bill of exchange into Europe. The Orient had also developed the idea of acting through another, an idea that seems to have found its way into the modern law of agency through the law of the church. Early mediaeval trading was outlawed rather than put under a special law. Its development paralleled the beginnings of primitive trade in which sheer need of that which was in the hands of the foreigner served to temper the fear and dislike felt for him enough to make a trade possible. Sometimes the rightless alien bought the protection of a powerful member of the community. Where there were constituted governments the rulers might for a consideration grant the right to do business, dictate the terms and provide for the summary decision of disputes. This was the procedure *secundum legem mercatoriam* promised in various charters and statutes. It is a procedure that is so named, not a body of law, for it was not until the end of the Middle Ages that any considerable amount of substantive mercantile law had been formed in the interstices of adjective law.

It was in the independent Italian cities, where the merchants were in power, that ordinances were first passed calculated to give a substantive content to mercantile law. Eventually Catalonia, France, Germany and the Low Countries followed with contributions. The materials were drawn from local law, Roman law, maritime law and from the practical arrangements between merchants for the convenient transfer of money or credit from country to country in days when it was neither convenient nor safe to ship precious metals or coins. Nevertheless, when the English royal courts began to take notice of these customs in the seventeenth century there was still much room for dispute about them.

Up to this time the English *lex mercatoria*

was in no way different from that of the rest of Europe except that it was more definitely applicable to aliens. Although a customary body of law like the common law, it did not become a part of it because the English royal courts at first took no cognizance of mercantile cases. These were adjudged in special courts: the courts of the fair, the courts of the staple and other local and limited courts. But it was not long before centralization was accomplished. Although the Middle Ages in England open with a wealth of special jurisdictions, feudal, ecclesiastical, maritime, mercantile and equitable, as distinct from the king's courts as American state courts are from the federal, a kind of federal usurpation had been going on for some time under various pretexts. The early years of the seventeenth century marked the turning point in the struggle. Lord Coke battled on behalf of the ordinary king's courts with varying success, but in the case of the commercial courts he was helped by the underlying facts, of which he was probably unaware, that commerce was passing from the hands of foreigners into those of Englishmen and that domestic commerce was ceasing to be a privilege based on royal or feudal grants but, subject to certain limited and questionable monopolies, was becoming the patrimony of every Englishman.

With the central courts ready to entertain the claims of the mercantile class and to ignore the decisions reached by the special courts, there began, under Lord Holt, a growth of commercial case law which by the end of the century was voluminous if not comprehensive. In another half century, when Blackstone lectured, the special courts were but a memory. The assumption by the king's courts of power over commercial disputes had two phases: first, it extended the scope of the law merchant by making all men potentially subject to it; secondly, it affected the law merchant itself by forcing it into the Procrustean bed of common law principles. Thus, on the one hand, no man could plead that he was exempt as a gentleman; on the other, various doctrines were grafted upon the mercantile law as, for instance, the doctrine of consideration upon the law of bills and notes, although it did not fit and although it assumed the troublesome form of a fictitious presumption that might become irrebuttable.

It was Lord Mansfield in the eighteenth century who earned the title Father of English Commercial Law. In the 1600's and early 1700's

every detail of the custom of merchants necessary to establish a case had to be alleged and proved as a fact if challenged. With the aid of a special jury of merchants Lord Mansfield undertook to establish various points of mercantile custom in order to render constant reiteration of the investigation unnecessary. Yet it is sometimes said even today that Anglo-American commercial law is based on the customs of merchants, and from this statement arguments are drawn for the recognition of current customs on the same basis as old ones. These contentions, however, overlook the fact that so much of mercantile custom as has been adopted is no longer mere custom but established law.

The "innovations" of Lord Mansfield were slurred in the newly independent United States, but under the influence of Judge Story's writings they soon became established as common law. No special "mercantile class" was recognized. Allusion has already been made to the acceptability in eighteenth century America of the theory of one law for all; there was also the practical reason that in pioneer society there was no separate mercantile class. The pioneer became at will or under necessity farmer, mechanic, carpenter, clerk, trader or professional man. A law for a mercantile class would have been intolerable to men who passed back and forth across any class lines that could be drawn. Thus it was not difficult to make a virtue of this necessity and to write or read into constitutions a prohibition against interference of any kind with the natural rights of an American citizen to engage in ordinary business or calling without let or hindrance.

This tendency has been not unconnected with the early habit of American business of fighting every regulatory law as discriminatory and confiscatory. Yet despite the absence of a *Kaufmannsstand* in American law increasingly regulatory legislation was bound to come with the disappearance of pioneer conditions, and it was fought with diminishing ardor and success as the nineteenth century drew to a close. The states have passed innumerable statutes governing business. In most of them a type of partial periodic codification has resulted, if not in a code of commerce, at least in chapters of such a code scattered through the general law. Laws of this character, which have been difficult to classify even under the formal continental codes, where they often have been embodied in special subsidiary laws, are to be regarded less as

commercial law than industrial law. For instance, acts against trusts, monopolies and unfair business methods do not regulate acts of trade as such and in many of their aspects are really to be regarded as public law. Nevertheless, their connection with the development of commercial law must be regarded as very intimate. One has only to consider the effect of the Constitution of the United States upon the development of the commercial law of the several states. It does not, for example, directly affect the state laws of contract. Yet the constitution, by preventing the states from legislating in a manner that will impair the obligations of contracts and by lending support implicitly to the economic principle of freedom of contract, has kept states from digressing very far from the beaten paths of contract law. The interstate commerce clause has prevented the states from raising artificial barriers against each other, and in more recent years Congress has used this clause to regulate interstate carriage and communication. Under the constitution the regulation of bankruptcy is a direct federal concern. The relation of public law to commercial law is clearly seen in the cases where the federal courts have jurisdiction by reason of diversity of citizenship. Even though the state law is supposed to be administered by them in cases where no federal question is involved, they have often followed a view of their own as to what the state law was, and in many instances they have thus forced upon the states the "federal view" of matters of common law. While this represents a process which has affected the growth of the whole body of American law, it has been particularly important with respect to the commercial law by reason of the fact that diversity of citizenship occurs so often in commercial transactions. A certain degree of uniformity has been thus achieved.

Uniformity in American commercial law has, however, been less the result of federal agencies and processes than of the intrastate adoption of uniform commercial acts. These have become a marked feature in the development of American commercial law. Each state began by giving its own interpretation to the common law despite some efforts to check such divergences. For instance, Story had declared that the New York courts had no power to affect the law of bills and notes. But by the end of the nineteenth century, with business becoming ever more nation wide in its scope and the jurisprudence of the several states widely diversified,

the framing of the uniform laws began by commissioners appointed for that purpose. They were soon presented to the several states for adoption, and today uniform state laws govern the following commercial matters in the number of states indicated: negotiable instruments (everywhere except Canal Zone and Porto Rico), sales (30 states, Alaska and Hawaii), bills of lading (25 states and Alaska), warehouse receipts (45 states, District of Columbia, Philippine Islands and Porto Rico), conditional sales (8 states and Alaska), partnership (16 states and Alaska), corporations (2 states), stock transfers (20 states and Alaska), fraudulent conveyances (15 states), limited partnerships (14 states and Alaska).

The codes of commerce which prevail in European states began to be introduced at the opening of the nineteenth century, when the general European movement for codification may be said to have been inaugurated. France led the way with its separate *Code de commerce* of 1807. Such was its prestige that it was adopted at the time over almost all of Europe, and it is still the basis of the codes of Belgium, the Netherlands, Poland, Greece and Serbia and in a large measure of that of Italy, which in turn is the basis of the Portuguese code. The Spanish code of 1885 on the whole adhered to the French code. About the middle of the century, however, a great impetus had been given to the study of commercial law in Germany under the leadership of Thöl and Goldschmidt. A general German act regarding negotiable instruments was adopted in 1847 and a general code of commerce was promulgated in 1861. The empire contributed the commercial code of 1897. The German codes have become very influential; and Austria, Hungary, Switzerland, Bosnia and Herzegovina, Japan and, as far as negotiable instruments are concerned, the Scandinavian countries have modeled their law upon that of Germany.

By force of universal interest in commerce rather than through any deliberate statutory change the commercial codes of Europe have come to be the most generally applicable part of the law, the law of everyday life. A curious reversal of the relative position of the civil and commercial codes, often almost unnoticed, has been taking place and is probably destined to have far reaching effects on the jurisprudence of Europe. For instance, when acts only unilaterally commercial are brought within the purview of the commercial law, the civil law

may be said to have been liberalized in effect although in another sense it may be said to have been superseded. The same result may be said to take place where the benefits of commercial legislation are extended to private individuals, as when bankruptcy is permitted to non-traders as well as traders.

In its international aspects commercial law raises many problems. These derive from the international character of commerce, which has always demanded uniformity in the legal rules under which it operates. The conflict of laws is troublesome also where it arises with respect to private relations, although commercial contacts and competition lead to friction more readily than do friendly visits. If some difficulties are experienced even in federal unions of states, they will be even more numerous among independent nations. It is true that the commercial law of Europe has a certain uniformity as a result of the common origins of its codes of commerce and that among all nations commercial law has had a certain similarity impressed upon it by the habits and necessities of commerce. Nevertheless, the divergences are great enough to create considerable pressure for international solutions. In extraordinary cases diplomatic machinery may have to be employed. Although the merchant who enters a foreign country to buy or sell is an alien and as such is dependent primarily upon the law of the land with which he trades he sometimes can invoke the diplomatic protection of his own government. Indeed, in the Near and Far East this has resulted in the established institution of extraterritoriality, the origin of which may be regarded as in part due also to the inadequacy, with respect to commercial transactions, of the law of the regions where it has prevailed. Yet as regards the most constantly recurring of the difficulties of international commerce it is the ordinary law that must supply adjustment. The principles of the conflicts of laws act as means of conciliation, as do international treaties of a commercial type. Much can be accomplished also by the progressive international assimilation of commercial law; and some headway has been made in this direction in European countries, particularly with regard to the law of railway freights and negotiable instruments, with respect to which the need for uniformity is particularly pressing.

The compensation for the difficulties imposed on the law by foreign commerce is its resulting tendency toward improvement. Commerce has

been both a cause and a means of transferring from country to country the results of experiments in the law. Thus comparative studies, likely to be academic in other divisions of law, are intensely practical in commercial law. Its problems and tasks in Europe as well as America may be said to center around the difficulty of making a working synthesis of the relatively stable, deep rooted, conservative national element in law and the rapidly varying needs of a commerce that is more sensitive to world wide developments than to local traditions. A separate code does not solve the problem for more than a moment, although it may lay the foundation for more rapid and independent adjustment than is possible where one must carefully distinguish without separating. The daily task of any system of commercial law is essentially one of adaptation of old legal tools to new purposes in order to supply business with mechanisms for its legitimate enterprises, and it is by its ability to do this that its success or failure must be judged.

In this process the commercial law has particularly reflected the increasing regulation of business everywhere. When Sir Henry Maine observed that the progress of all law was from "status to contract" his statement may have been true, but the modern tendency is in quite the opposite direction. In the field of commercial law, for instance, there has taken place a standardization of contracts and hence of contract obligations, as in contracts of employment, insurance, transportation or conditional sales, due to the complications of modern business, which have made it all but impossible to bring into personal contact all the persons among whom legal relationships are created. The transformation of other institutions of the law has been no less marked in other ways. For instance, the trust, devised to aid thirteenth century monks to hold land when they were debarred from acquiring legal title, after serving later generations as a means of evading feudal burdens, as a testamentary device, as an escape from mortmain, as a scheme for organizing charities and non-established churches, as a plan for family settlements and particularly for the emancipation of married women, has come down to our own day to be experimented with as a credit device (the original trust receipt), as an organization device (not only as in the proscribed trusts of the nineteenth century but the business trust of today), as a risk shifting device (the original investment trust) and in

general as a substitute for stewardship (the trust company with its many services). Again, the subsidiary corporation, at first a timid experiment, has been adapted to uses that are almost legion, ranging from a mere bookkeeping convenience to the most complicated and delicate balancing of financial powers with curious adjustments of return, risk, ownership or investment, not to mention its convenience as a substitute for royalty agreements in the working of a patent or as a better arrangement for local representation than the selling agency or even as a new form of land tenure. The mortgage in connection with corporate finance has undergone no less startling changes. Beginning as a simple land mortgage to one lender or to a small group it is now the most complicated of documents, serving as a basis of corporate finance and reorganization. The gap between the law in the books and the law in business is great but its size is after all a measure of the rate at which business changes are wrought.

COMMERCIAL POLICY. *See* ECONOMIC POLICY.

COMMERCIAL ROUTES. Economic or potentially economic resources are so unevenly distributed over the earth's surface that even the possibility of human life is in places contingent upon the transport and interchange of goods. The surpluses above bare subsistence, without which, as Alfred Marshall justly remarks, "even the simplest civilization is impossible," have more utility and are more prized if exchanged to some extent between localities. Some "foreign" trade—that is, trade between geographically separated groups—has taken place in practically all the societies concerning which we have exact information. Particular goods tend to flow from places where they are plentiful to those in which scarcity exists, and to exchange for goods drawn in the opposite direction by the same economic forces.

The commercial routes along which these goods flow are determined by both economic and non-economic forces. Of these the first may be summed up as the pull of commodities or, if viewed from the other end, of demand. This pull is affected by the social organization and the prevalent habits of consumption as well as by the methods of economic exploitation which de-

termine the nature of the goods and the difficulty of securing them. Prominent among the basic non-economic factors conditioning the placing of trade routes are distance, topography, climate and the existence or absence, as well as the direction of flow, of bodies or streams of water. To these might be added martial or peaceful traditions, political organization, the sympathy or antipathy between racial and cultural groups and the general human thirst for adventure. As the economic life of societies grows complicated, rationalization and calculation enter more and more into such problems as the relative cost and speed of transport. In the modern system of world trade changes take place rather rapidly through invention, while closely computed rate differentials determine the routes taken by passengers and freight.

Remains give us some idea of the products actually exchanged by societies living before the time of recorded history, but for their commercial technique we must rely largely upon analogy with primitive peoples now in existence. Various tribally organized societies have well developed group and territorial divisions of labor, involving the regular exchange of products along fixed routes. Im Thurn (*Among the Indians of Guiana*, London 1883, p. 270-74) and Roth ("An Introductory Study of the Arts, Crafts and Customs of the Guiana Indians" in Bureau of American Ethnology, *Annual Report 1910-17*, Washington 1924, p. 634-35) have described such specialization by tribes along the north coast of South America. This is mainly land trade, but R. S. Fortune, in a paper recently read before the American Anthropological Association ("Economic Background of the Kula"), has pointed out a similar intertribal division of labor in Melanesia in which the exchanges take place along water routes. Of the fixed commercial lanes used by primitive peoples the natural watercourses are perhaps the best example.

Fixed commercial routes are found far back in historic times. As early as the Code of Hammurabi—roughly 2100 B.C.—the caravan trade in Babylonia was so well organized that the *respondentia* type of combined interest and insurance contract (still in use in the nineteenth century A.D.) was already in vogue. Similar bottomry contracts were common in the maritime trade of Phoenicia, India, Greece and Rome. The horse may have been known in the Near East at the time of Hammurabi but was not in general use until at least five hundred

years later. The donkey was chiefly relied upon for the longer land hauls, and water routes were preferred where practicable. Wheeled carts were used with donkeys for centuries before they were with horses but for the longest commercial hauls never entirely displaced pack animals. Among these the camel began to be important in the Levant about 1500 B.C. He does not appear to have been in general use in Egypt for another thousand years or in the Sahara for still another seven hundred.

Trade centers and routes are associated in various ways. For example, that part of the Syrian coast which lies nearest to the great bend in the Euphrates River has often furnished meeting places for oriental and occidental goods. Antioch has had a particularly long history as such a commercial center; others near by have at times been more important, and not always for economic reasons. Similarly, whenever there was considerable oriental trade with the Mediterranean in mediaeval or classic times, some port on or near one of the mouths of the Nile was almost certain to be flourishing. Egyptian commerce made these sites doubly advantageous. The ancient Egyptians had a shallow, meandering canal, probably at least 150 miles long, through the Isthmus of Suez to one of the mouths of the Nile, and it was reconstructed at various times later. Before the days of steamboats and power dredges this must have been of mediocre value for trade between the Indian Ocean and the Mediterranean. The Red Sea is over 1400 miles long and conditions are decidedly unfavorable for navigation with oared or sailing vessels; goods from lands bordering on the Indian Ocean were generally unloaded far south, sent across to the Nile by caravan and floated down. When a commercial center like Antioch or Alexandria had seized its opportunity and become the terminus of naturally superior trade lanes, the market itself deflected other routes or attracted new ones. Once established, such centers have often prevented the growth of rivals by force, as in the case of Bruges and Sluys in the Middle Ages. The force may be financial, not military; in the United States Providence, Rhode Island, has suffered from the watchful jealousy of Boston and New York.

The improbability of the Phoenicians having been in direct contact with India and China before the time of Alexander the Great is now generally conceded. But after his conquests there was a fairly regular flow of spices, silk and other oriental goods westward, and Alexandria in

Egypt soon became one of the great centers of oriental-Mediterranean commerce. Trade along this most famous of historic routes took a tremendous leap after a Greek named Hippalos discovered in the first century A.D. that it was possible to sail with the monsoon direct from the mouth of the Red Sea to India and to return after the seasonal wind direction had changed. Ships went to Barygaza, north of Bombay, and to Ceylon, where they met Chinese junks. The rival route up the Persian Gulf and the Euphrates River and thence across the desert to Syria was more subject to interruptions because of war, but it carried a heavy traffic at all other times. To forward these expensive eastern goods and to move the heavier produce of the region itself the small light ships of the time followed the shores of the Mediterranean and Black Seas, crossing only when it was unavoidable. The Roman system of roads supplemented sea and river routes, although the aims of many of their highways were largely strategic, the cost of transport high and economic life in the empire local to a degree which taxes the imagination of people in our age.

In the west the Roman Empire expanded to a point where, because of the expense and slowness of transport at the time, the periphery could no longer be made dependent upon the center, either politically or economically. The frontiers finally disappeared in the slow process of unifying the culture of the Roman fraction with that of the rest of a great continent. Constantinople, the remaining capital, was in the Near East, which had an older and more highly developed economic life than Italy. In the Byzantine or Eastern Roman period which followed, a new Persian Empire threatened to cut off the Syrian trade with the Orient altogether. The other old route by way of Egypt, the Red Sea and the Indian Ocean was too far from Constantinople, and the eastern end of it was especially difficult to control from there. The emperor Justinian tried to renew the contact with Chinese silk traders in Ceylon, and also to open all-land routes to the Orient, passing to the north of the new Persian Empire. His success was mediocre in both cases. One important result of the partial blockade was the smuggling of silk worms into the Levant and the founding of the industry there.

Within two centuries the followers of Mohammed wiped out the Persian state, reduced the Asiatic holdings of Constantinople to Asia Minor, conquered the entire southern shore of the Mediterranean and even took Spain. The

Moslems, in possession of both Syria and Egypt, generally preferred to deal with their co-religionists. In contrast with the great days of the Byzantine Empire, few Syrians now visited Christian Europe. Goods came into Syria and Egypt from the Orient with more freedom than before, but if the Europeans wanted them they had to press the trade themselves from the West. The movement of grain, olive oil, pastoral products and various other items from north Africa across the Mediterranean continued, and at times in the Middle Ages the commerce of Genoa and Marseille with ports of what are now Algeria and Tunisia was as large as that with all Syria.

European trade with the Levant and indirectly with the Far East was greatly stimulated from the twelfth to the fourteenth century by expeditions from the West, the larger of which are known as crusades. In the same process the final decay of the Byzantine Empire was greatly hastened by the assaults of its co-religionists. On the other hand, the only considerable region where the crusades did Mohammedanism any lasting damage was Spain. Syrian trade was permanently injured by invasions from central Asia, one of which reached Bagdad in 1258 and another Asia Minor itself in 1402. In the meantime the general westward movement of central Asiatic peoples which in the thirteenth century culminated in the Tartar conquest of a vast area of eastern Europe had opened up new possibilities for northern land routes. Lajazzo, Erzerum, Trebizond and the Crimea prospered at the expense of Antioch, Acre and Bagdad. In the far north the rising German trade in the Baltic gained a tremendous impetus from the cutting by the Tartars of the old Varangian trade routes to the Black Sea. The invaders did not get quite far enough to control this Baltic commerce.

Mediaeval trade between northern Italy, southern Germany and France over the well defined land routes was greatly hampered by tolls, regulations, disordered currencies and frequent military violence entailed by the multiplicity of feudal authorities. Oriental and Mediterranean goods for Atlantic Europe and the return cargoes for them more and more took to the sea after about 1300. These "Flanders Fleets" from Venice used some northern ports, notably Bruges, in common with the vessels of the Hanseatic League. Mediaeval Europe had a fairly complete system of main sea routes, supplemented by traffic along rivers and wagon or pack trails. If the Roman economic organization

was somewhat more intensive (which is not entirely beyond dispute), that of the late Middle Ages exploited and knit together in its own fashion several times more territory in Europe. There was, however, almost no direct contact between the Orient and the Mediterranean, Arabs having taken over the commerce of the Indian Ocean. Whether eastern goods came over southern or northern routes, camel driving peoples carried them over the final laps of the journeys before they got into European hands. The number of intermediaries, the unfamiliarity of final buyers with conditions of production, transshipments from water to land and vice versa and the expensiveness of land haulage all helped to keep down the volume of trade. Moreover, the long chain of monopolies, elaborately organized and in the hands of people who did not even know one another, proved resistant to change.

Eventually European public order improved, national states began to appear, local monopolies were brought under control and the conditions surrounding road and river transport were greatly ameliorated. The most important trend of the early modern period was the dwindling in importance of the Levant trade. Even before the voyages of discovery this trade had been more or less dislocated. Disorders in the Near East were partly responsible. The decay of agriculture in the Tigris-Euphrates country led to the decline of cities like Bagdad and curtailed the possibilities for trading between the Persian Gulf and the Mediterranean. Constantinople was already crippled when the Turks took possession in 1453 and their efforts to build up the trade were not successful. One of the great disturbing factors had been the copying of Levantine and oriental goods in Europe on such a scale that the close of the Middle Ages found some industries largely transplanted. The opening of direct sea routes to the Orient and the discovery of America, coming almost simultaneously, constituted a devastating blow to the Levant trade and opened a new commercial era.

Between the beginnings of the voyages of discovery and the perfecting of the steamboat and the railway in the nineteenth century a revolution in deep sea routes took place. Ships with instruments were developed which could sail for days or weeks out of sight of land, effectively harnessing the winds for motive power. World trade, properly speaking, laid its solid foundations on cheap, direct haulage by sea. On the other hand, such changes as took place in inland routes were at first largely sub-

sidary to the developments mentioned above and consisted of the multiplication, with some refinements in detail, of things known for centuries. Natural watercourses were improved and eked out here and there by canal construction. Roads as good as the Roman ones were being built in various parts of Europe by the latter part of the eighteenth century. The speed attained was about the same as in ancient times and no considerable innovation in the way of artificial power had been achieved. Canals provided with locks (a mediaeval Italian or Dutch invention) lessened the cost of haulage somewhat and tapped some new inland regions; but the real opening of the interior of vast continents still had to wait. The primitive tramways of the sixteenth, seventeenth and eighteenth centuries were subject to the same basic limitations; their crawling speed and high costs limited the distances they could traverse and the kinds of goods they could carry.

At the outset the steamboat had more important effects upon inland than ocean routes, solving as it did the great problem of up stream propulsion. World history down to about 1810 had often turned on the fact that rich territories could not be assimilated economically, and hence politically, because of the limited volume and high cost of up stream traffic. Thus the Romans were handicapped in their occupation of the lower Danube valley because it drains too far to the northward into the Black Sea; and they failed altogether to manage that section of Germany where the rivers flow north and northwest. Mediterranean and Atlantic Europe were curiously separated in mediaeval and early modern times, each with its own economic nuclei. The rapid development of the Mississippi valley is an outstanding illustration of the effects of steamboats. Before their introduction imports had been almost prohibitive in cost and extremely slender in bulk. The effects, social as well as economic, of making the rivers genuine two-way commercial routes were revolutionary. Roads and canals, as feeders and connecting links, were made financially practicable by the growth in traffic. At the outset the railway itself was less a pioneer into new regions than an auxiliary to these older routes, getting its start by sharing business they had created. Wind is a fairly satisfactory source of propulsion on the open sea but it can be almost useless at close quarters, between winding river banks and against a strong current. In harbors also, where the terminals of inland and deep sea transport

systems coincide, the tugboat and other powered craft add almost indefinitely to the capacity for handling promptly large quantities of goods.

It was the railway which ushered in the placement and function of commercial routes familiar to us. On the basis of it enormous areas like the United States and the Russian Empire were united in a way previously impossible. It first made feasible the opening up of wide prairies, the swift, economical crossing of desert and mountainous stretches—in short, the political and economic unification of vast territories more or less in defiance of their strictly natural features. And the same mechanical age which applied steam power directly to the tramway and the boat soon learned to use it more indirectly in refining the transport system by dredging, shoveling and blasting out artificial waterways on an entirely new scale. Thus commerce between Europe and the Far East was revolutionized, for at least a second time, by the opening of the direct deep water route through the Isthmus of Suez; and world trade routes were again redrawn by the more difficult engineering feat at Panama.

The Suez Canal route cut nearly 3500 miles from the distance by sea from Liverpool to Hongkong, a reduction of one third. Practically 45 percent of the distance to Bombay was annihilated by the same stroke. While the saving in miles to Australia was slight, the alternative route made possible new combinations of ports, cargoes and passenger services out and back. Although, in general, Atlantic ports of the United States profited less, New York was brought 2293 miles nearer Hongkong. The cost of certain oriental goods delivered in the countries bordering on the north Atlantic dropped 25 to 35 percent in fifteen years. Demand was stimulated by the falling prices and the saving in distance made possible about a third more traffic, even without any change in the available shipping. The shifts from sail to steam and from wood to iron in ship construction were already well under way by 1869, and the swing from iron to steel was just beginning.

New York came finally into its own as a nucleus of world trade routes with the opening of the Panama Canal in 1914. Coastwise voyages between Atlantic and Pacific ports of the United States were shortened by 7000 to 9000 miles. Hongkong was brought as close to New York via Panama as via Suez, and Shanghai and Yokohama 1876 and 3768 miles closer, respectively. The west coast of Latin America is

now reached from Atlantic ports of the United States almost as quickly and cheaply as the east coast. Sydney is about equally far from Liverpool by any one of three routes, and New Zealand is actually 1500 miles closer to Liverpool by the Panama Canal.

For the trade of some areas the competition between the Suez and Panama routes is keen, but generally the two complement each other. A few ports like Punta Arenas in southern Chile have suffered from the Panama route. Even for San Francisco the opening of the Panama Canal was not an unmixed blessing. Manufacturers and importers on the Atlantic coast began making many shipments direct by water to and from the Orient, whereas formerly the goods had moved across the United States by rail. For this new type of voyage San Francisco became a mere port of call instead of a port of origin. The bulk of the trade is several times larger than in 1914, but the nature of it and the routes followed are greatly changed. Deep water canals through Suez and Panama have contributed also to the recent tendency toward scheduled line traffic in the ocean freight business, replacing the sporadic voyages of tramp steamers. The emphasis upon speed, exact routes and time schedules has of late years increasingly hurt the sailing ship.

What often escapes attention is the way in which the growing dominance of a price system with closely calculated items has coordinated the various kinds of commercial routes. The same ships which carry some goods direct from Japan and China to New York call at Seattle or San Francisco and turn over raw silk to the trans-continental railways for quicker transit. Although there is competition between motor and rail routes, seventy American railways in 1929 were using motor trucks, tractors and trailers. Some of these companies also operate busses, while many independent bus lines supplement rather than compete with railway systems. Because of its great speed and a certain flexibility of route the airplane has taken over some traffic which would formerly have gone by rail. Great railroads have accepted this fact and inaugurated cooperative joint services aiming at the combination of speed with economy, comfort and safety. In a number of countries, particularly Germany, the canal has become a genuinely integral and largely non-competitive transport factor.

All over the world inland transportation by water, rail, road and air feeds the ports and is fed by them. Sometimes there is financial integration between deep sea and inland routes, al-

though it is generally partial and rarely necessary. For example, a French steamship line owns a system of busses and hotels in north Africa, while an American railway from the Pacific coast has its own steamship line from New Orleans to New York; but in neither case does the combination of land and water routes give a real monopoly.

The integration of the world's trade routes and the division of traffic on the basis of comparative costs cannot be understood separately from the commercial revolution which has taken place within a century. Telegraphic, cable and wireless transmission of quotations and information has accelerated the spread of our western price system. Speed and precision of delivery have increased at the same time that the cost per ton-mile and passenger-mile has dwindled. One of the best general indices of civilization is the degree to which territorial specialization is worked out on the basis of natural advantages. Commercial routes and techniques are inseparable, nor can either be viewed independently of the industries whose products they move; but the cost of haulage throws much light on all three. On an average, freight moves about five times as fast today by rail as it did by wagon early in the past century, and the cost is far below one fifth. Due to the speed achieved and to the organization of both commerce and industry heavy and perishable goods can be delivered in a manner that would have been impossible a hundred years ago. Along some economic frontiers like the northern Sahara transport by pack camel is about as cheap as by motor car or narrow gauge railway. Here the decisive difference between the two methods is not in cost but in speed and in the kind of goods which it is practicable to move at all.

The general economic and social effects of new commercial routes, and of the growing intensity and regularity of traffic along older ones, are the most impressive of all, although they lend themselves more to description than to calculation. Goods are more uniform in quality and price today than would have been deemed possible even a century ago. Under the pressure of a new commercial revolution the distinctiveness of old civilizations has broken down, sometimes too fast. Rapid transit, including the frequent delivery of mail to hamlets and farms, has helped to decide ancient issues between town and country. The United States is never to develop a peasantry of the Old World type, and even in those countries where the inertia of his-

tory is behind them distinctively peasant conditions are being undermined. More and more, rural populations produce for market, buy in markets where there is a saving and really calculate these differentials. We are facing a genuine, world wide price economy for the first time, and it raises problems which have been only vaguely considered.

City people no longer live walled in. They see country life as well as read about it, and the converse is also the case. To live ten, or even twenty to forty, miles from one's daily work is no longer unusual. Seasonal and longer migrations of laborers take place on a vast scale. Products are not merely hauled in great bulk between distant continents but are literally transplanted half way around the world with an elaborately calculated premeditation on the basis of cost which is unprecedented. This is one of the main reasons why no group of people can long resist the all pervading economic system of the Occident, which is brought to them by commercial routes and which cuts the ground from under their feet unless they construct similar foundations.

COMMERCIAL TREATIES are contracts between states relating to the rights and protection of person and property, to commerce, navigation

and consular jurisdiction and in some cases include specific customs tariff rates and other special provisions. The understanding is generally embodied in a formal instrument, negotiated and ratified according to the constitutional requirements of the respective countries; sometimes, and especially when limited in scope, it is embodied in a less formal agreement or convention or in an exchange of notes.

Until modern times the problem of commerce, if it arose in any form, related not to the rules under which trade was to be conducted but to the right to trade at all. The trader was essentially an adventurer and, if a foreigner, was looked upon with suspicion or even hostility. The empires of Mesopotamia and Egypt, Athens, Corinth, Tyre, Carthage, Palmyra, Petra and Rome traded with barbarians and savage peoples on the periphery of the then civilized world. They exacted from one another rights to trade as spoils of war. After his victory over the Arameans at Aphek Ahab exacted an agreement from Ben-hadad under which the Israelite traders were permitted to conduct bazaars in "streets" in Damascus as Ben-hadad's father had done in Samaria (*1 Kings* xx: 34). From necessity some trade was tolerated between peoples and there were no doubt arrangements for its protection. Classical writers allude to them and the texts of a few treaties have come down to us, such as the commercial treaties between Carthage and Rome dated 509 B.C. and 348 B.C.

During the Middle Ages commerce continued to be insecure or was at best protected by custom. It was subject to burdensome local taxes and regulations, against which the policy of mercantilism later became a liberal revolt. Permission to trade was personal, expressing itself in royal letters, charters and special laws. In the twelfth century Genoa, Pisa and Venice began to make definite and formal arrangements for trading and the practise, spreading over Europe, became the genesis of the modern system of commercial treaties. Slowly personal privileges were supplanted by more general and durable ones; mere permission gave way to rights. The first treaties were contracts affecting only the states directly participating in the negotiations—there being at first nothing in them in the nature of the most-favored-nation clause—and large entities, such as the very right to trade, were bargained for without the refinements which characterized later treaty bargaining. Under the pressure of competition for equal treatment,

however, particularly in the Near Eastern markets, the idea of the most-favored-nation clause took form. It became the practise to include in a treaty the pledge, usually unilateral, that the western state or commercial city would receive as favorable treatment as that accorded any other.

Of the thousands of commercial treaties that have been in force the following may be regarded as among the important landmarks: the earliest English treaty, that with Norway in 1217; Cromwell's treaty with Sweden in 1654; the Methuen treaty of 1703 between England and Portugal; the first commercial treaty of the United States with France in 1778; the Convention of Commerce and Navigation between the United States and Great Britain in 1815, which is still in force after more than a century of commercial peace between the two peoples; the Cobden treaty of 1860 between England and France, which began a liberalizing tendency in continental tariff schedules; the most-favored-nation provision (art. xi) of the Treaty of Frankfurt, 1871, between Germany and France; the commercial treaties negotiated by Germany on the basis of her general and conventional tariff of 1902; the commercial treaty sections of the peace treaties following the World War; and the German-American commercial treaty of 1925.

With the improvements in production and transportation and the expansion of trade and finance has come the growth of a complex commercial treaty structure which has become an important factor in stabilizing and regulating the economic relations between states. Two liberalizing tendencies have carried us far beyond the ideas embodied in the early treaties: first, the tendency to assimilate the rights of aliens to those of nationals; and second, the replacement of the mere permission to trade, often temporary and uncertain, by the right to trade under equal and stable conditions.

Changing commercial policy has been reflected in the use which nations have made of commercial treaties. Great Britain during her free trade regime, having no tariffs with which to bargain, used her diplomatic influence to extend the use of the general commercial treaty with the guaranty of unconditional most-favored-nation treatment. The United States at the beginning of its history found the conditional principle of the most-favored-nation clause best adapted to combating the harsh discriminatory policies of European states, but as American

interest shifted to internal development the commercial treaty became relatively unimportant and the conditional principle became sterile or, in so far as it was effective, its results were quite different from those originally sought. Following the World War the economic interests of the United States in foreign markets called for a more affirmative policy and the government initiated a new series of commercial treaties containing the unconditional most-favored-nation principle.

In Europe with the rise of the multiple (schedule) tariff systems the commercial treaty became an important instrument in the effort to coordinate a policy of protection for domestic industry with the encouragement of export trade.

The provisions of modern commercial treaties cover a wide range of subjects, such as: conditions of residence, travel and trade; immigration and emigration; police protection and civil rights; admission of diplomatic and consular officers, their rights and activities; vehicles and instruments of communication and transportation; navigation, quarantine and harbor regulations and dues relating thereto; conditions for importation, exportation, transit, transfer and warehousing of merchandise; tariffs and customs laws; protection of patents, trademarks, copyrights and other industrial property rights; possession and disposal of, or succession to, real and personal property; payment of taxes; rights of commercial, industrial or financial associations; exemption from military service, municipal functions, forced loans and extraordinary levies; treatment of commercial travelers and their samples; bounties and drawbacks; internal duties and local dues; treatment of vessels seeking refuge from damage or shipwreck; salvage operations and dues; coasting trade, and port to port trade with foreign cargoes; extraterritorial jurisdiction; freedom of religious worship; and right of burial with suitable decorum and respect.

Aside from certain miscellaneous provisions the contents of the modern general commercial treaty fall into three sections—consular rights, national treatment and most-favored-nation treatment.

Sometimes in a separate convention, sometimes in a section of a general commercial treaty, nations define the conditions under which they will exchange consular agents, consuls or consuls general—how they are received, their rights and their duties. Consular officers are

exempted from taxation; they are permitted to fly their national flag over their offices; their archives are protected; they may request redress or protection for their nationals; they have jurisdiction over disputes on their national vessels when within their districts; they can take depositions, authenticate documents and administer estates of their nationals dying within their districts.

Under the so-called Capitulations (*q.v.*) which western states negotiated with Near Eastern and Far Eastern peoples extraterritorial jurisdiction was provided for and consuls of western states were declared competent to act as judges in civil and criminal cases involving their own nationals and to apply in such cases their national law.

National treatment is a guaranty to the citizens of one of the contracting parties of the same treatment received by the citizens of the other contracting party in the matters specified. Under the influence of the tendency to assimilate the rights of aliens to the rights of nationals this treatment is often guaranteed by either municipal or international law, but it is also often specifically referred to in connection with certain matters in commercial treaties. The phrase "national treatment" seldom occurs in commercial treaties and the nature, scope and extent of the treatment pledged in any treaty must be determined by the language employed. For example, in the treaty of 1815 between the United States and Great Britain reciprocal national treatment with reference to duties or charges on vessels is guaranteed in the following language: "No higher or other duties or charges shall be imposed in any of the ports of the United States on British vessels than those payable in the same ports by vessels of the United States; nor in the ports of any of His Britannick Majesty's territories in Europe on the vessels of the United States than shall be payable in the same ports on British vessels."

In many other matters a nation agrees to place the citizens of another on an equality with its own, as, for example, in the right to engage in lawful commerce and industry; in the guaranty of all civil rights and access to the courts for protection of person and property; and in equal treatment with nationals in payment of import and export duties.

It is the policy of nations generally to reserve for their own citizens certain rights and privileges which for one reason or another are not extended to aliens. For example, it has been the

policy of the United States for over a century to reserve the coasting trade exclusively for vessels of its own citizens. When, therefore, national treatment is pledged in terms sufficiently broad to cover this trade, a provision is introduced expressly excepting coastwise shipping. The Convention of Commerce and Navigation of 1852 between the United States and the Netherlands provides that neither party shall impose upon the vessels of the other, from whatever place arriving, any duties or port charges of any kind or discrimination which shall not be imposed in like cases on national vessels. This convention then provides that: "The present arrangement does not extend to the coasting trade and fisheries of the two countries respectively, which are exclusively allowed to national vessels . . ."

Equally important and better known than national treatment is the principle of most-favored-nation treatment. The former has been the central treaty principle in the tendency toward assimilation of rights of aliens to those of nationals; the latter has been the principle which has contributed to the establishment of equal and stable treatment as between states. Most-favored-nation treatment is the pledge to grant generally or in certain specified matters the same and equal treatment to the citizens and goods of another state as has been or may be granted to the citizens and goods of any third state which is on the point of becoming a favored nation. It is not the purpose of the most-favored-nation clause to establish a most favored nation, that is, a nation more favored than others. On the contrary, its function is to maintain equality of treatment and to insure to each state that it will at all times be treated as favorably as the state which is "most favored." The practical effect of the clause is to obtain for each of the contracting states any benefits which momentarily make a third nation favored. A more accurate term would be "the equally-favored-nation clause."

It is always a matter of importance to a state to be assured that the treatment its citizens receive at the hands of another shall not be less favorable than that which the other accords to the citizens of a third state. The principle of most-favored-nation treatment is based upon the conception that a state is entitled to, and should grant, equality of treatment in commercial relations. As a safeguard against oversight at the moment of negotiation and to obviate the necessity of subsequent negotiations the provision known as the most-favored-nation clause was devised to insure to the contracting states

the benefits not only of concessions previously made but also of those subsequently to be made by either of the contracting states.

Most-favored-nation clauses occur in commercial treaties in a variety of forms. It is, however, sufficient to distinguish the bilateral from the unilateral; and the unconditional from the conditional.

The bilateral clause is reciprocally binding on both parties to the treaty and is the usual form in all treaties between states on the same international plane. The unilateral clause obligates only one nation to avoid discrimination and was the form of the most-favored-nation clause in the Capitulations and in some treaties with eastern states, e.g. article 9 of the Treaty of 1856 between the United States and Siam.

Many refinements appear in the discussion of the conditional and unconditional forms and interpretations of the most-favored-nation principle. The conditional form recognizes a distinction between concessions gratuitously made and concessions made in return for an equivalent concession by the other state; whereas the unconditional form names no conditions or circumstances limiting the immediate and automatic extensions of any concession when it is granted to any third state. Both forms recognize in principle that any act of either party to a treaty which makes a third power a "favored nation" is contrary to the treaty and entitles the party discriminated against to the same favor. Under the conditional interpretation a favor granted to a third nation for a compensation does not create in the technical sense a "favored" nation, and the other party to the treaty is therefore unable to claim the advantages of the concession without offering an equivalent concession.

The conditional form and interpretation of the most-favored-nation principle obtained vogue in the United States, both because of the legalistic reasoning of our statesmen and jurists, who insisted upon applying the Anglo-Saxon doctrine of "consideration" in the law of contracts to international treaties, and also because of the survival of the old idea that treaty bargaining concerns primarily only the contracting states and that a tariff rate reduction, made upon the "condition" that certain reductions be made by the other party, is not to be granted to any third power unless that power gives an "equivalent" concession.

The conditional form was inaugurated at the end of the eighteenth century when tariff rates

were of minor importance in bargaining as compared with larger rights of commerce and navigation. But tariff bargaining during the course of the nineteenth century became largely a statistical controversy over the relative value of concessions to be made, and it became increasingly difficult to arrive at any agreement upon the equivalent concession to be made by the third party. Furthermore, the United States in the case of certain reciprocity treaties took the extreme position that the third country could not offer any equivalent concession because the value of the original concession consisted in its being exclusive.

The United States adopted the policy of equal commercial treatment in the Tariff Act of 1922. Supported by this legislative authorization the American government refrained from renewing its request for the preferential tariff treatment which its citizens had enjoyed in the markets of Brazil and, furthermore, in various exchanges of notes and treaties, completely abandoned its century old policy and replaced in its commercial negotiations the conditional by the unconditional form of the most-favored-nation clause. A model was drawn up for a new series of commercial treaties and the most-favored-nation provisions were couched in the unconditional form. The new policy came before the Senate for the first time in the commercial treaty with Germany, which after full consideration was ratified February 10, 1925.

The unconditional most-favored-nation principle was used to generalize concessions under the commercial treaty system of Europe from the Cobden treaty of 1860 to 1914. In the recent post-war period doubts arose concerning its utility because of its association with the pre-war aggressive treaty policy of Germany. In general, however, the soundness of the principle is accepted and the tendency is not to revert to the old conditional practise but to make effective the unconditional principle (see League of Nations, Economic and Financial Commission, *Reports and Proceedings*, Geneva 1927). When all countries follow the unconditional most-favored-nation practise, equality of treatment is guaranteed generally and tendencies are set in motion contributing to commercial stability, simplicity and uniformity of tariff rates, mutual confidence and international good will.

The tariff treaty is one of the results of tariff bargaining. It is an extension of the general commercial treaty and is usually like the latter in

that it contains the most-favored-nation clause. Modern governments have had at the same time certain economic interests pressing them for protection against foreign competition and others asking for aid in obtaining reductions in foreign tariffs which interfere with their export trade. The aims of these two groups are not easily reconciled, but the reconciliation was attempted by means of the tariff treaty. In Europe, therefore, the tariff treaty became more and more important.

The conditional most-favored-nation principle had a logical corollary in the United States in certain of our tariff bargaining experiences which were directed toward obtaining special and, where possible, exclusive concessions. In some of these experiences the method used was that of imposing penalty or additional duties; that is, rates additional to those fixed by legislation for normal conditions. The bargaining provisions of the tariff acts of 1890 and 1897 are examples. Under the former the president concluded a number of agreements while the latter was the means whereby the United States obtained certain concessions from Brazil in 1904.

In addition to penalty duties the Tariff Act of 1897 contained two provisions which empowered the president to grant reductions in duties in favor of nations making similar concessions to the United States. Section 3 of the act authorized the president, in return for "reciprocal and equivalent concessions," to grant special reductions from the duties on a very limited number of articles. Instead of penalty duties the principle is here introduced of making reductions in the regular tariff rates on certain articles in return for reciprocal reductions in the tariff rates of other countries. Two series of agreements known as the "Argol agreements" were negotiated and proclaimed. Section 4 of the Tariff Act of 1897 also provided for certain agreements which, before becoming effective, required the ratification of the Senate. Under this section the so-called "Kasson treaties" were negotiated but never ratified.

American experience under the acts of 1890 and 1897 demonstrates conclusively the futility of bargaining for special and exclusive favors. No country could have been in a stronger economic position; but even so the actual trade gains were small and uncertain. In no sense did they compensate for the effort expended, for the misunderstanding arising and for the ill will which they engendered among other peoples.

The United States has at various times en-

jeavored to enter into closer commercial relations with neighboring countries, Hawaii, Mexico, Cuba and Canada. In the case of the treaties with Hawaii (1875 and 1898) and with Cuba (1903) the United States refused not only to accept equivalents from other nations in return for concessions granted these countries in the American market but also to allow those countries to generalize the concessions which they granted to the United States. Under her treaty of 1851 with Hawaii Great Britain was, from her point of view, entitled to the concessions granted the United States, but the American government refused to let Hawaii yield. In the treaty with Cuba it is stipulated that the concessions shall not be granted to any other country. "Propinquity and neighborliness," it has been said, "may create special and peculiar terms of intercourse not equally open to all the world." Frelinghuysen in a note to Mexico in 1884 entered "a courteous denial that the most-favored-nation clause applies to reciprocity treaties."

Probably the extreme in this particular phase of the subject was reached in the attempt in the treaty of 1886 with Tonga to read a special interpretation into international law. The article providing for most-favored-nation treatment contained the following clause: "it being understood that the Parties hereto affirm the principle of the law of nations that no privilege granted for equivalent or on account of propinquity or other special conditions may come under the stipulations herein contained as to favored nations."

The purpose of reciprocity may be to develop foreign markets for the products of a country, to promote closer political relations, to assist weaker economic units, or it may be a combination of all these ends. While special arrangements are in general undesirable for the reason that they tend to discriminate against third countries there are cases where close political and economic bonds would, even from an international standpoint, justify a reciprocal arrangement. The reciprocity agreement of 1903 with Cuba probably falls in this class inasmuch as its discontinuance would be a distinct injury to Cuba and to her prosperity, which depends on political and geographic relations with the United States, whose place no other country could take.

The effect of exclusive concessions in tariff treaties differs according to the circumstances. Exclusive concessions may operate as bounties to the producer, as they did in the case of the Hawaiian reciprocity treaty, or they may uni-

mately accrue to the benefit of the consumer, as they did in the case of the Cuban reciprocity treaty.

In bargaining there is a psychological advantage in being able to offer to reduce tariff rates in return for reductions desired from another country. Two tariff systems have had this advantage: the maximum and minimum system, under which the legislative branch of the government fixes a schedule determined by the minimum needs of revenue or protection; the general and conventional system, which is similar to the maximum and minimum with the exception that the lower rates are fixed by the executive. The lower rates are made effective either directly in a commercial treaty or through the operation of the unconditional most-favored-nation principle, which has supplemented in operation both of these double tariff systems. The negotiations under these systems tended to bring into effect all the lower rates, and if they had been completely successful and if the lower rates had been generalized by the most-favored-nation principle the result would have been the same as a single tariff fixed by each country according to its domestic needs.

But the double column tariffs failed either to establish equality or to moderate the level of tariffs. The high or fighting rates were used to exact advantages while at the same time concealed discriminations in customs regulations and commodity classification were used to avoid the obligation to grant equal treatment under the unconditional most-favored-nation clause. The experience of European countries during the last generation shows that the concessional method of tariff bargaining leads by its very nature to bickerings and tariff wars. At best it results in concealed, instead of open, discriminations against third countries. Furthermore the outcome has been higher tariffs. Each country made generous advances in its rates to fortify its position for bargaining purposes; and the concessions which it granted were frequently, if not usually, less generous than the preliminary tactical increases. Nations using the multiple tariff system with the maximum and minimum form have always definitely fixed the minimum rates at a level deemed necessary by them either for the protection of their home industry or for the production of revenue. Or if they have used the general and conventional system they have fixed the general rates high enough to allow abundant room for bargaining while still maintaining effective protection. The same special

economic interests or lobbies which exert their influence in favor of high tariff rates are equally effective in establishing the minimum or conventional rates in a multiple tariff system. Hence a system of bargaining for concessions on the basis of a multiple tariff tends not to lower the general level of a tariff but rather to increase it.

Penalty or additional duties used in conjunction with a single column tariff fixed on the basis of domestic need (revenue or protection) are the most effective means of establishing equal treatment. Under such a system the use of tariff treaties is limited to special cases, such as a border agreement or a reciprocity treaty justified by some peculiar geographical or political situation. The instruments required are: the general commercial treaty, to which we now return as a sound instrument of commercial policy; and a penalty provision in the single column tariff law similar to Section 2 of the Tariff Act of 1909 and to Section 317 of the Tariff Act of 1922. Provisions like these become active only when a foreign country discriminates. They provide not fighting but protective tariffs. They tend to be ineffective if too much discretion is left to the executive in their application. With certain restrictions which will permit bargaining their application should be compulsory if the discrimination is not removed. Their application should also be sufficiently flexible to reach all cases, including concealed discrimination, with commensurate penalties.

Bargaining for special advantages might work to the advantage of weak nations if the strong refrained from exerting their power, but in international dealings that is not likely to occur. Weak nations, if they champion a regime of special bargaining, are only forging weapons that may be used against them. On the other hand, the principle of equality of treatment gives to the economically strong nations only the advantages which are theirs by reason of their strength. At the same time it affords the economically weak nations a degree of protection not available to them under the harsh operation of a system of special dealings.

The World War for a time gave undue prominence to aggressive and discriminatory policies in commercial negotiations. The Central Powers had planned a *Mittleuropa*; the Allies had adopted the Paris Economic Pact of June, 1916. The unilateral most-favored-nation principle was forced on Germany for a limited time by the peace treaty. In the United States there was a

vigorous but unsuccessful demand for the restoration of the old discriminatory navigation laws. Such policies will always be brought forward by narrow national or class groups or by minorities seeking to use the processes of government for their personal gain.

The economic conference held at Geneva in 1927 checked the spread of discriminatory and exclusive policies. One of the results was the multilateral convention and protocol for the abolition of import and export prohibitions and restrictions (proclaimed by the United States March 6, 1930, United States Treaty Series no. 811). The preamble of this convention declares "that import and export prohibitions, and the arbitrary practices and disguised discriminations to which they give rise, have had deplorable results" and "that a return to the effective liberty of international commerce is one of the primary conditions of world prosperity."

Although liberal tendencies have begun to reestablish themselves, progress is slow. Economic difficulties in agriculture and industry have aggravated the situation. Nations are re-examining all the principles of commercial policy and are asking anew whether the acceptance of them conforms with their interests. European nations showed great reluctance to commit themselves in the preliminary conference with a view to concerted economic action at Geneva in 1930. Nevertheless, that conference did accept a "tariff truce" for one year and recognized as indispensable "that concerted action should be undertaken, directed to secure closer cooperation, the improvement of the régime of production and trade, the enlargement of markets, and to facilitate the relations of the European markets between themselves and with overseas markets, so as to consolidate economic peace between the nations" and "that it would be advisable for international negotiations to be undertaken for this purpose at the earliest possible moment, so as to determine the speediest and most effective means of adjusting economic conditions in their respective countries, of organising more rationally the production and circulation of wealth, and of removing, as far as possible, unjustified hindrances which hamper the development of international trade."

These conferences under the League of Nations indicate that the scope of commercial treaties is widening. Bilateral treaties had already been supplemented by multilateral treaties which deal with post, aviation, industrial property, sanitation and other similar subjects. The

Economic Committee of the League is doing further constructive work in this field, preparing draft conventions on such subjects as the execution of foreign arbitral awards and the treatment of foreigners and foreign undertakings.

The conviction is growing in spite of obstacles that if a group of nations, as in the war period, can cooperate to apply bad commercial policy they can under the proper impulse combine to make effective sound policy. Treaties are becoming more than instruments for the protection of rights and for securing fair commercial treatment. The municipal law of modern states has to a large degree extended to the person and property of aliens the same protection which is granted to nationals, and discriminations in commerce are regarded as exceptional and contrary to the principle of comity of nations. Far from lessening, this tendency to recognize as universally applicable the principles of friendly intercourse has increased the importance of commercial treaties as instruments in the movement contributing to uniformity, preciseness, soundness and stability of commercial law. Moreover, the growing number of multilateral commercial conventions which organize specific phases of international life foreshadow an adequate code of international commercial law.

COMMERCIALISM is the excessive concentration of attention upon the value in exchange or money value of goods and services. The analysis of what degree of concentration is excessive, however, is too seldom undertaken by social critics. The word "commercialism" carries a certain condemnatory tone and is generally used to indicate disapproval of business men and manual workers who frankly desire to receive some purchasing power in exchange for what they do. When applied to the desire for gain among pressmen, politicians, public entertainers or artists the term has even more unfavorable connotations. But for the social scientist it is impossible to condemn morally the fixing of some attention on the gain to be derived from any occupation; the only issue is what constitutes excessive attention in any given case.

In all communities where exchange of goods and services has been of any importance men have attended to value in exchange at the critical moment when barter or the calculation of money rates for facilitating trade occurred. But the

professionalization of such attention by the trader undoubtedly tends to make others uncomfortable in relations with him. Since in very simple societies trading, even where it becomes common, does not often attract concentrated attention, the low estimate of commerce and trading in later times may perhaps represent a survival of primitive conceptions. This estimate is reinforced in a mediaeval society by the operation of a caste system. Thus in Chinese tradition the scholar ranks above the merchant, while both rank above the warrior. In the European form of mediaevalism the saint, the scholar and the warrior are held in higher esteem than the craftsman or merchant; and there is a still lower estimate of the lender of money. Moral valuation in these societies involved the assumption that the less one thinks of the value in exchange of what one does, the more excellent is one's action. This is also the social "tone" of Homeric mediaevalism, which is reinforced by the low esteem in which work for gain is held by such writers as Aristotle and Plato. European mediaevalism, like that of India and China, confused the issue still further by a conception of saintliness or holiness, according to which a person was excellent if he did not think of the money cost of the services he accepted from others—if, for instance, he begged for food or was given it while he pursued "voluntary poverty."

Disdain for the consideration of money gains has always been greatest among those classes which have either inherited wealth or acquired it by force or privilege; and commercialism still implies moral contamination partly because the possessors of wealth and privilege have never had to consider the value in exchange of their activities. Mediaeval theologians, such as Thomas Aquinas, although they were greatly concerned that the trader maintain a "just price," were quite blind to the economic value in exchange of the services which the lords and the clergy accepted without thought. Similarly, at the present day men and women with inherited incomes who "give" their activities in public service have the gravest doubt whether poor men who have to receive incomes in order to undertake public service will not think too much of the incomes and too little of the public service.

Thus, although in the normal development of civilization craftsmanship and trading gradually become sources of wealth, alternatives to land-owning or caste privilege, they continue to

suffer moral and even religious disapprobation from the survival of the moral standards of mediaevalism. Luther and the early Protestants derived a large measure of strength from their restoration of moral value to craftsmanship, trading and especially money lending. Among the middle classes the ability to acquire wealth became a sign of divine favor. Except by the aristocrats and their dependents, the artists, it was no longer regarded as objectionable to think of how to increase one's wealth; and no doubt the attention to the acquisition of wealth became excessive among those who had never had any. The Protestantism which helped to establish nineteenth century capitalism (through its praise of thrift and industry) has been condemned on this score with increasing frequency; but its defect in inducing too much attention to the economic relationships between men is no greater than the defect of mediaevalism under which the saint and the noble profited by those very economic relationships without thinking of them.

The extent of commercialism in earlier times is difficult to estimate: but certainly mediaeval kings, knights and priests often had "an eye to business"; and as late as the eighteenth century what we call public services in law or the navy or diplomacy commonly furnished examples of commercialism. With the growth of democratic ideas in the early nineteenth century it came to be thought improper to use a public position mainly as a source of private income. At the same time the development of "professional" standards came to prevent the use of skill mainly as a means for extracting wealth from those for whose benefit the skill was employed. But the conception of public service was not extended to include industrial production; professional skill might be present in medicine, surgery and law, but not in banking and salesmanship. Throughout the nineteenth century some activities were generally regarded as naturally "commercial" and others as somehow superior. The application to the latter of standards of pecuniary value regarded as appropriate to the former was severely condemned. Thus a man might properly make and sell butter in order to gain wealth; but if he sold beauty, as in music or painting, he was condemned for "commercialism." Such an attitude could not long resist modification in the face of the realities of an increasingly economically orientated society. It was soon recognized that the artist must of necessity consider the ex-

change value of his products if he wished to survive. The possible menace to the integrity of his artistic imagination was balanced against the similar dangers of a system of patronage. As one after another of the non-industrial activities has been molded into the form of the business system, general concern and condemnation have gradually given way to specific analyses of the limits of commercialism. Thus we have come to take for granted the provision of public amusements by commercial organizations and to condemn only that degree of dominance of pecuniary considerations which would take away all excitement from contests or prevent all experimentation in dramatic spectacles. In another field attention has been shifted from the selling of news to the delimitation of the legitimate exercise of advertising pressure on the more subtle forms of control of opinion. The devising of a new method of marketing literature may raise temporary cries of commercialism, but the spread of such new business devices attracts less and less attention. The explicit acceptance of pecuniary valuations is perhaps most delayed in such spheres as those of religion or philanthropy. The modern church is still divided as to the legitimacy of a business organization of the affairs of the other world, although here too the process of distinguishing between desirable economic practices and commercialism is already under way.

From the opposite angle the earlier unshaded conception of commercialism is being modified by an increasing awareness and an increasing exploitation of the public service aspects of all industrial and commercial enterprise. From this point of view consideration of the economic value in exchange of whatever one does may be a step forward in morality, since value in exchange is an expression of certain important social relationships, and not until all occupations are thought of "commercially" is it possible to distinguish vicious "commercialism" in any one of them. Commercialism in the condemnatory sense is just as deplorable in the making of butter as in the making of beauty.

Commercialism in its most undesirable forms became dominant in the early stages of industrialism, partly because it became easier to acquire wealth rapidly, partly because the educational and religious guides of society ignored or opposed, instead of directing and inspiring, the new order. Thus commercialism dominated society, and the only aspect of the new system

which attracted attention was the obvious private gain which could be derived from it. It becomes increasingly obvious, however, that if men want not only boots and bread but also news, beauty, religious insight, civil order, knowledge and amusement they can be made to "pay" for the latter as well as the former. It was inevitable that the press, art, religion, politics, education and amusement should be "commercialized," in the sense that they came to be regarded mainly as sources of income for those who controlled or supplied them. It also becomes evident that if the true character of teaching is misrepresented when it is considered to be mainly a source of wealth for the teacher so also the true character of the act of making boots may be misrepresented if that act is considered to be mainly a means of obtaining wealth. Vicious commercialism, then, is not the application of standards suitable for some occupations to other occupations, but the concentration upon the money value of any occupation to the person within it. An excessive attention to money value in any act is such as excludes all attention to other aspects of the act or such as involves subordination of human welfare in general to economic welfare. The press is commercialized if the main purpose of those who own or control it is the money gain they derive from it, because the press serves other and more important purposes—entertainment by gossip, information necessary for citizenship, discussion of public affairs. Similarly, art or education are commercialized if the artist or the teacher underrate their importance as sources of increased vitality in the community. But there is no moral reason for applying a different standard to salesmanship or boot making: these occupations also serve more important purposes than the mere provision of purchasing power for those who perform them.

Morally, value in exchange is a sign of the interdependence of men in a civilized society; and it might be held that every man ought to be doing not merely what he thinks his fellows need but what his fellows indicate that they want by paying for it. But value in exchange is not a sign of need or of what men ought to want; and therefore too absolute an attention to this value in exchange may obstruct the provision of real needs by promoting the supply of mere wants. Commercialism is vicious in most cases where "what the public want" is offered as an excuse for not considering what they need; and a similar moral defect is to be

found in some forms of advertisement, which aim at the creation of wants, often vicious or devitalizing, rather than at the increasing supply of needs. On the other hand, it must not be assumed that superior persons or "experts" know what others need: if men will pay for jazz and will not pay for Beethoven, it is by no means certain that Beethoven would be good for them.

Concentration upon the money value of what is done is traditionally supposed to diminish its real value for human welfare, as in the case of boots made to be sold rather than to be worn. Similarly, if a business man or a manual worker thinks of his occupation mainly as a means of obtaining an income, it is supposed that the quality of his work is lowered. This assumption may, however, be questioned and is certainly subject to qualification. If the maker is the only judge of the quality of his product it is likely to be less excellent than if others can show their valuation of it in the market.

The modern tendency of social idealists toward uncritical condemnation of commercialism produces much the same result as did the condemnation of usury by the mediaeval church: idealists are severed from current practise and moral guidance is ineffectual in the daily occupations of the vast majority of people. A secularization of morality is sorely needed in this field.

The present stage in the development of western civilization involves an increasing attention to the economic aspect or exchange value of goods and services. Commercialism, in the bad sense, therefore affects many more aspects of life than before. This implies, however, not moral decadence but a moral advance. A system of widespread payment for services is an advance upon a system of forced services accepted without thought by the privileged. Commercialism in the modern world is therefore a disease which is itself a sign of a more healthy general situation in the relations between men. Economic interests are not amoral: in order to give them their correct place in the general standard governing human acts other interests should be made more obvious or more definite. The increase of opportunities for enjoyment, improved vitality due to better education, a variety of personal contacts with those of another sex or age or race—all these naturally dwarf the purely economic aspects of action and therefore reduce the risks of commercialism. When definite purposes other than a gain in purchasing power are before the eyes of most men the abnormal concentration of attention

on gain decreases. The best antidote to commercialism is public spirit, or a governing conception of one's action as valuable mainly because of its effect upon the community.

COMMINES, PHILIPPE DE (c. 1447-1511), French chronicler. He was descended from a very ancient family of Flemish nobility. After serving for a number of years as counselor to Charles the Bold, duke of Burgundy, he decided in 1472, from motives which are unknown, to transfer his allegiance to Charles' enemy, Louis XI, king of France. He remained during the lifetime of the king his confidential adviser. With the coming of Charles VIII to the throne Commynes was temporarily disgraced but soon regained royal favor, which he continued to enjoy under Louis XII.

Commynes' fame rests on his *Mémoires*, written at intervals during the years from 1488 to 1498. Although composed with no pretensions to literary style and with no unifying theme except the personality of Louis XI they constitute a historical source of the first quality and are invaluable in affording interesting sidelights on the formation of the modern state. They cover in an extraordinarily vivid first hand manner, and yet with surprising critical detachment and self-effacement on the part of the chronicler, the reign of Louis XI and, after an interval of ten years, the Italian campaigns of Charles VIII. The intricate politics of these reigns are described by a politician of keen insight who devoted his life to political negotiations under four princes and was thus able to draw for his material on personal recollection. The primary purpose of the author is to explain events and occasionally to generalize concerning their broader import. These digressive reflec-

tions, with which the *Mémoires* abound, bear witness to Commynes' remarkable intelligence and talent as a statesman. Because of his glorification of the role of the prince and his conception of politics as a means of increasing the prince's power he has sometimes, although with little justification, been compared to his contemporary Machiavelli, who was decidedly his superior both in knowledge and in power of mind. Incapable of theoretical reasoning, Commynes confined himself to the practical and the realistic, and the value of his work is attributable primarily to the fact that from an early age he had a share in the great events of his day and thus enjoyed the opportunity of observing with clear insight the political conditions prevailing in the fifteenth century.

COMMISSION SYSTEM OF GOVERNMENT is a form of city government in which all executive and legislative powers are combined in the hands of a single small board elected by the voters of the municipality. It represents a radical departure from the traditional type of city government, in which executive authority is usually divided between a mayor and various other heads of departments while legislative powers are entrusted to a city council. The distinctive characteristic of the commission form of government is its abandonment of the principle of checks and balances.

The commission plan, while it had previously been tentatively tried in various places, first received attention through its establishment in Galveston, Texas. There it was the immediate outcome of the disorganization caused by a tidal wave which swept in from the gulf and partially destroyed the city in September, 1900. Prior to this disaster the city had been governed by a

mayor, a board of aldermen elected by wards and various other elective officials. All had powers independent of one another. The municipal tax rate was high, and the city ran heavily into debt through the habit of borrowing money to liquidate annual deficits. The inundation of 1900 created an emergency which the existing municipal government was unable to meet. The city defaulted on its outstanding bonds and found itself faced by virtual bankruptcy. Consequently the legislature of Texas was asked to intervene, which it did by abolishing the old city government and vesting all powers in the hands of five commissioners, who after 1903 were all made elective. It was provided that these five commissioners by majority vote should enact the city ordinances, authorize all appropriations, levy taxes, borrow money and make all appointments. The administrative work of the city was to be divided into four departments which four of the commissioners were to apportion among themselves, one department to each; the fifth commissioner, the mayor president, exercising a coordinating supervision over them all. But the plan was looked upon as an emergency measure, a sort of municipal receivership, and it was anticipated that when normal conditions were fully restored the old mayor and council plan of government would be reestablished.

The results, however, were such as to convince the people of Galveston that the plan ought to be continued permanently, and the commission plan began to attract widespread attention throughout the country. Other Texan cities adopted the plan. It spread northward and during the years 1908-14 it gained acceptance by more than four hundred cities throughout the United States and Canada, including several large urban centers such as Buffalo, New Orleans, St. Paul, Jersey City, Newark and Oakland. Then the movement slowed down, and during the years which have intervened since the close of the World War the commission form has lost considerable ground. Many cities have abandoned it and either have reverted to mayor and council government or have adopted city manager charters.

While not all features of the commission plan are uniform in the cities working under it, the essentials are everywhere the same. There is a single governing authority known as the city commission and consisting of five citizens elected at large for a term of two or four years. As a rule the nominations are made by a direct non-

partisan primary and there are no party designations upon the ballots used at the subsequent election. One of the five commissioners acts as chairman and usually bears the title of mayor but ordinarily has no independent executive powers. All business of importance is dealt with by the commission as a whole. It meets frequently and all its sessions are public. Each commissioner, including the mayor, assumes immediate supervision of a group of related administrative functions which are included under such headings as public safety, public finance, public property. In some cities there is provision for the use of the initiative and referendum, and in some the commissioners are subject to recall by popular vote.

On the whole the commission system has demonstrated the value of concentrating responsibility. It has provided a plan of city government which is simple and intelligible. It has encouraged the use of business methods in the conduct of municipal business and to some extent has drawn better men into public office. On the other hand, it has proved to be lacking in executive unity and has the weakness characteristic of all types of board government in that it too easily becomes a house divided against itself. There is a strong temptation for three commissioners to combine against the other two. That is what has happened in many commission governed cities, involving endless friction and chicanery. Another essential weakness of the plan is that although each commissioner is given supervision of a department the other commissioners can overrule him on any point. Hence the system insures neither unified control nor departmental independence.

In other words, the commission as a legislative body is too small to be adequately representative, while as an executive authority it is too cumbersome to be efficient. It is a five-headed executive, a pyramid without a peak. Hence it has not succeeded in providing the cities with either continuity or harmony in the conduct of their administrative affairs. In recognition of this organic defect many cities have modified the commission plan into a commission manager system, an arrangement by which the commission retains legislative powers but devolves all the administrative work upon an appointive city manager. This makes possible the concentration in a single head of the responsibility for departmental administration.

In spite of its defects the commission form of government has rendered a great service to

the cause of municipal reform. It embodied a protest against the old diffusion of municipal authority and has made for the simplification of municipal machinery throughout the United States. In general, however, it has proved more successful as a protest than as a policy.

COMMISSIONS. The word commission is employed in English speaking countries as the official title of many governmental bodies which consist of a number of members and are otherwise called boards. The most characteristic application of the term is to bodies charged with enforcing a regulatory statute by what may be called the administrative as distinguished from the judicial method, i.e. by a system of official inspection, permits and orders rather than by criminal prosecution or civil suits for violations of the statute.

In this sense the word and the thing are a legacy from the era of Tudor administrative efficiency. The term appears at the end of the fifteenth century as a designation of any special body of officials charged by royal commission or warrant with the performance of specified duties. The Tudors relied heavily on such bodies, some of which functioned quite like modern administrative commissions. Thus the Statute of Sewers (23 Henry VIII, c. 5) authorized the appointment of commissioners with power to make regulations and orders and to levy assessments. One of the functions which the crown occasionally conferred by commission on special bodies was that of hearing and determining controversies touching private rights. This practise, which reached its extreme in the so-called Court of High Commission, threatened the jurisdiction of the ordinary law courts and aroused constitutional objections which contributed to the downfall of Charles I. The practise was, however, continued in the system

set up in 1643 for administration of the excise laws, which vested commissioners with jurisdiction to enforce the tax and punish violations by penalties and seizures. The excise was long a target of abuse, culminating in Dr. Johnson's famous definition of it as "a hateful tax adjudged not by the common judges of property, but by wretches hired by those to whom excise is paid." These controversies fixed the connotation of "government by commission" in the English speaking world, and in the 1840's and 1850's when J. Toulmin Smith (*Government by Commissions Illegal and Pernicious*, London 1849) and Francis Lieber (*On Civil Liberty and Self-Government*, Philadelphia 1853, 3rd ed. 1874) came to write of it they had dominantly in mind the determination of private rights by official action, taken in a non-judicial manner and without the safeguards for liberty and property which the common law procedure is supposed to supply.

Meanwhile the word commission continued to be used of any governmental body created to perform a special task. In this sense it was applied to the numerous investigating bodies (Commissions of Inquiry) which in the era of law reform in England during the second quarter of the nineteenth century were created to take testimony and frame proposals for legislation. Even such purely fact finding bodies fell under the suspicion of "government by commission," and were fiercely denounced by Toulmin Smith. His assault was chiefly occasioned by the extensive recourse to the administrative method for enforcing much of the new social legislation enacted in England between 1825 and 1850. Thus the Metropolitan Buildings Act, the Poor Law Amendment Act, the Ten Hours' Act of 1847 and the Public Health Act of the following year all provided for boards with rule making powers, with a staff of inspectors and with the right to act in a quasi-judicial manner in making orders and in granting or revoking permits.

The wholesale introduction of this type of administrative enforcement came later in the United States than in England. Meanwhile the term commissioner had come into use for a variety of officials, some of them purely judicial, such as the inferior federal officers known as United States commissioners and the temporary supreme court commissions appointed in some states to clear the docket of the highest court, and in other cases executive officials such as the county commissioners, who in most states make up the chief governing organs of counties.

More recently commission government has become the designation of a special type of municipal government. The present treatment is chiefly concerned not with these miscellaneous commissions and commissioners but with commissions as organs of the administrative, in contrast with the judicial, method of enforcing regulatory statutes. Sometimes the organ set up for this purpose is not a board but a single commissioner, like the commissioner of banking or of insurance in many states. The functions of such an officer no less than those of a board exemplify the administrative method of regulation and merely raise the question whether in applying that method concentration of responsibility is more desirable than the wider opportunities of consultation offered by a board. In our federal government the recent tendency has been toward boards; in the states a number of regulatory functions are still entrusted to single commissioners. The debate as to which is preferable recurs periodically; the whole method of administrative regulation, whether through a board or a single official, is constantly under attack as "bureaucratic," expensive and provocative of governmental interference with private rights.

The arguments in favor of administrative regulation by commissions, as contrasted with criminal prosecution or private action for damages in the courts, are that it makes possible preventive restraints in advance of actual injury and that it supplies an expert agency charged with taking action in the public interest, where there would be no assurance that private action in the form of a damage suit would be taken at all or taken often enough to serve as an effective deterrent of a public evil. Thus, while a lawsuit can be brought by an abutting neighbor for damage from a disease breeding nuisance the public health is better safeguarded by a governmental agency which possesses powers of inspection and has been authorized to order and supervise the removal of unsanitary conditions. Similarly, the public is better protected against incompetent physicians by requiring candidates for medical practice to be licensed by an examining board than by leaving the victims of incompetence to recover damages in a lawsuit. The requirement that physicians be examined and licensed goes back in England to Tudor times; licensing boards for many occupations requiring special fitness were set up in our states without protest during the nineteenth century, as were building inspectors, health

commissioners and commissioners of markets and docks in many municipalities. More recently racing and boxing commissions have been established in certain states.

The middle of the nineteenth century witnessed efforts to extend administrative regulation to business practices in particular fields, and commissioners or "superintendents" of banking and insurance were created in many states with power to grant licenses, require reports and formulate rules. With the beginning of railroad construction in the 1830's and 1840's railroad commissions were established in Rhode Island in 1836 and in New Hampshire in 1844—even before such a body was created in England in 1846. The English commission was abolished in 1851 and its powers transferred to a law court; and when a railroad commission was set up in Massachusetts in 1869 its powers were limited to requiring and publishing reports. About this time popular antagonism to railroad management in western states led to the so-called **granger** laws, which created commissions with power to fix rates and oversee and prevent discriminatory practices. Much of this legislation was soon repealed, but it had its influence in bringing about the establishment of the Interstate Commerce Commission in 1887 with power over rates and practices of interstate carriers. The powers of the commission were, however, cut down by the Supreme Court, which held it without statutory authority to prescribe rates [*Cincinnati*, *New Orleans* and *Texas Pacific Ry. Co. v. Interstate Commerce Commission*, 162 U. S. 184 (1895)]. In England a court of railway commissioners was established in 1873. The Railways Act of 1921 created a separate Railway Rates Tribunal.

A new period of government regulation of business began in the United States during the Roosevelt era, and between 1902 and 1913 forty-one states established railroad or public service commissions, most of which were given regulatory powers not merely over railroads but over public utilities generally, including street car lines, pipe lines, water, light and power companies, telegraphs and telephones. In many states administrative bodies have more recently been established under blue sky laws to oversee the issue and sale of corporate securities, with power to grant and revoke permits and require reports. Administrative commissions have also been set up as the usual organs for assessing compensation under workmen's compensation acts, for administering factory inspection laws

and for applying minimum wage laws. The commission method of regulation has also been extended in the federal government. The powers of the Interstate Commerce Commission were enlarged by the Hepburn Act of 1906, which conferred authority to fix rates. The Pure Food and Drug Board set up in the same year was followed by the Federal Reserve Board in 1914 with certain powers over banking and credit. In 1914 was also established the Federal Trade Commission to supervise trade practices and prevent unfair methods of competition and attempts at monopoly. In 1920 the Federal Power Commission was created to regulate lessees of water power rights on public lands, and the Federal Radio Commission was set up in 1927 to administer the statute regulating allocation of wave lengths and the use of the air for radio communication.

The theory of administrative regulation requires that it should be in the hands of experts. Most matters submitted to such regulation are of a technical nature, as professional qualifications, building specifications, sanitary and safety devices, railroad rate schedules, chemical constituents of food, radio wave lengths. On all these trained judgments are required to determine the standards of conduct to be exacted and this is one reason for withdrawing them from the decision of a jury in an ordinary lawsuit or criminal trial. While such technical judgments can be supplied by the expert staff of the administrative body, the theory of commission regulation proceeds on the supposition that the commission will itself be an expert body. While the supposition is borne out by the facts in the case of examining boards, and sometimes in that of health boards and other sanitary agencies, it is frequently not realized in other administrative bodies except in so far as long service in a specialized post may lead to a certain technical proficiency; and sometimes it is frankly abandoned, as in those state utility commissions, more than a third of the entire number, whose members are popularly elected. The same thing is true of those federal commissions whose members consist of cabinet officers and which must accordingly rely on their employees for expert personnel. The resulting combination of the lay point of view with the technical is likely to enrich both, where the commission members are men of ability and standing and where they devote their entire time to their work. Cabinet officers, however, cannot do this; and hence the agitation for a

reorganization of the Federal Power Commission to substitute a full time personnel in place of cabinet members. This was accomplished by act of June 23, 1930.

There is danger in subjecting commissions too closely to political influences because of the combination of functions which they exercise. To perform their task they must have the right to conduct inspections and as a result initiate action against a party apparently transgressing the statute. On the other hand, they must themselves try the question of whether or not such transgression has occurred in order to determine whether to revoke a license or issue an order to cease and desist. This places them in the dual role of prosecutor and judge. For this reason some commissions, especially state public utility commissions, have tended to minimize their function of initiating action and have preferred to regard themselves as judicial bodies waiting to be moved to action by private complaint. Such a policy defeats the intent of the administrative method of regulation, of which an essential element is that a public body should initiate action in the public interest on its own motion. The combined role of prosecutor and judge would no doubt be intolerable if the judgment of a commission were absolutely final; but it is not final and on certain issues there is recourse to the courts. None the less, the danger that commission action may be influenced by political considerations in the sense of pressure for partisan or sectional advantage is always serious; and hence the importance of securing the independence of commissioners through protection in their tenure of office. The relatively short terms provided for most state commissions do not make for such independence; still less does the method of popular election. In Pennsylvania the courts have held that the governor may not remove a public service commissioner without the consent of the senate [Commonwealth ex rel. v. Benn, 284 Pa. 421 (1925)], but this only puts the commission at the joint mercy of governor and senate instead of at the governor's mercy alone. The only safe guaranty of independence would be a tradition of reappointment coupled with a habit of selecting appointees in the first instance from men of high qualifications and independent judgment. Hitherto our American political outlook has been too much dominated by timidity to trust to the effectiveness of such a guaranty.

Not only are administrative commissions necessarily prosecutors and judges at the same

time; they must also be at the same time both judges and legislators, making many of the rules which they apply. This follows from another feature of the administrative method of regulation—the practise of laying down in the statute only the broad outline of the standard of conduct to be enforced and leaving the detailed requirements to be filled in by the commission. Thus it seems clearly desirable that a regulatory statute should not congeal into permanent requirements the details of sanitary or engineering science as currently understood, but should merely prescribe a general standard of cleanliness or safety or wholesomeness and vest the administrative body with power to make and alter from time to time rules and regulations translating into detail what the standard requires in particular types of situations. In so far as commissions make such rules in advance to govern their action in future cases their function is obviously legislative; in so far as they undertake to apply them or to apply the general standard supplied by the statute, to determine what orders to make in particular cases, their function is judicial. This combination of legislative and judicial functions was for some time combated in the United States as unconstitutional because inconsistent with the theory of separation of powers; while the exercise of rule making power by administrative organs was itself attacked as an unconstitutional delegation of legislative power. The courts, however, acting under a sense of realities, have not sustained these contentions but to soften the effect of their decisions called the power of commissions only quasi-legislative and quasi-judicial.

The extent to which commission action in making rules or deciding particular cases is subject to question in the courts is one of the recurrent issues of administrative law. In general the common law remedies against public officers by mandamus, certiorari, injunction and civil action for damages are available against administrative commissions unless specifically cut down by legislation or judicial decision; and frequently other remedies, such as a direct appeal to the courts, are added by statute. The basis of the right to question commission action in the courts is the fact that commissions, being purely statutory creations, have no jurisdiction to exceed the authority committed to them by the statute; so that the question whether they have kept within the terms of the statute is always one for the courts. This includes the question whether a rule made by a commission

and sought to be applied by it in a particular case conforms to the statutory grant of power. In England the courts have frequently been ousted from jurisdiction over this class of questions by a clause in the statute providing that orders made by the administrative body, even though not in conformity with the statute, shall have the same force as if contained in the statute itself. Clauses of this kind are denounced by Lord Chief Justice Hewart in his *The New Despotism*; they would be clearly unconstitutional in the United States.

How far the courts will examine commission action in detail to determine its conformity to the statutory grant of power depends in part on the provisions of the statute in question and in part on the rules governing the type of proceeding by which review is sought. In general it may be said that the courts show reluctance to reverse administrative action merely on the ground that they differ from the administrative body as to the conclusions to be drawn from the evidence in the case—in judicial language, they are reluctant to review questions of fact. On the other hand, where the administrative conclusion could not have been reached without transgressing a general rule which the statute lays down or implies or which for some other reason the court chooses to regard as a legal rule, there will be reversal for error of law. The issue between broad review, including questions of fact, and narrow review, limited to questions of law, is still the subject of debate in the United States. The doctrine of narrow review is favored by those who are impressed with the desirability of efficient government and with the need for governmental action in the interest of the general welfare; while the traditional American distrust of all governmental agencies except the courts and the traditional reliance on the courts to undo all the supposed mistakes of government lead in other quarters to advocacy of a reviewing power so broad as in effect to require the courts to do over again the work of administrative agencies.

Consult: There is no history or general treatment of

the system of administrative regulation by commissions as a whole. The broader questions raised by such regulation are treated in connection with special aspects of the subject in Dickinson, John, *Administrative Justice and the Supremacy of Law in the United States*, Harvard Studies in Administrative Law, vol. II (Cambridge, Mass. 1927); Freund, Ernst, *Administrative Powers over Persons and Property* (Chicago 1928); Robson, W. A., *Justice and Administrative Law: A Study of the British Constitution* (London 1928); Hewart, G. H., *The New Despotism* (London 1929); Port, F. J., *Administrative Law* (London 1929). Articles on particular commissions and on commission regulation in general are innumerable. Some of them are collected in *Readings on the Relation of Government to Property and Industry*, compiled by S. P. Orth (Boston 1915).

COMMITTEE OF THE WHOLE. *See* COMMITTEES, LEGISLATIVE.

COMMITTEES, LEGISLATIVE. Legislative committees are organs set up by a representative body to promote business by the division of labor. They enable a more manageable group than the full chamber, when operating under normal procedure, to examine a question, hear testimony, discuss and draft a law and prepare a report thereon. Committees in the different legislative bodies of the world, national and local, vary in such features as selection, function, power and duration.

In the British Parliament resort to committees came early, and by 1340 joint committees of lords and commons were being appointed to draw up statutes. An early standing committee was that of privileges and elections which was set up in Queen Elizabeth's reign. It was probably under James I, however, that the very important device of the Committee of the Whole was first used by the House of Commons, primarily to protect it against the king. Under a chairman of their own choosing the members of the House held secret sessions unobserved by the speaker who, as an appointee of the crown, was regarded as hostile.

The modern version of this device in the House of Commons is still called the Committee of the Whole, but has, naturally, quite different purposes, its principal function being to secure greater informality in procedure. When appropriations are the business under consideration the designation is the Committee of the Whole on Supply or, more commonly, the Committee on Supply; when the business is the revision of revenues it becomes the Committee on Ways and Means; for other matters a title indicating the business under consideration is used. The

speaker leaves the chair and his place is taken by the chairman of Ways and Means or the deputy chairman. These committees of the whole report their decisions to the whole House of Commons. Jefferson called this a quasi-committee and the device was early adopted by American legislative bodies. The Senate has a Committee of the Whole and the House of Representatives a Committee of the Whole House and a Committee of the Whole House on the State of the Union, the latter designation being used when money bills are under consideration. In congressional procedure as in the Commons their *raison d'être* is the achievement of a greater informality and, in addition, in the House of Representatives an evasion of the constitutional requirement of a quorum. The latter calls for a majority of the House, but in Committee of the Whole only one hundred representatives need be present.

Until comparatively recent times the House of Commons did not segment itself into legislative committees in the manner characteristic of the American Congress. There were a few select sessional committees, such as those on public accounts (for considering the report of the auditor and comptroller general) and on public petitions (to examine the money petitions sent to the House of Commons). Special committees were used for particular investigations. When the matter was political a committee composed exclusively of Commons members was used, in other cases commissions on which outside experts could sit. Private bills were sent to private bill committees which passed upon the issue involved—a characteristic and extremely valuable practise of British parliamentary procedure. Committees on ordinary public legislation to lighten the labors of the House of Commons were not set up until the eighties. In 1882, however, there were created two standing or grand committees to consider measures relating to law and trade. They consisted of from sixty to eighty members. They were presided over by a chairman selected from a chairmen's panel of from four to six members designated by the committee on selection. Proceedings in these grand committees were much like those in the Committee of the Whole. Designed to deal with a rather technical series of bills the committees did useful work. In 1894 a standing committee for Scottish bills was formed from all the members for Scottish constituencies and fifteen or twenty other members. In 1907 the standing orders were modified to

provide for four standing committees, of which one was a Scottish committee, and their competence was extended to cover all bills except money bills or bills for confirming provisional orders. In 1919 the number was made six, and in order to lighten the labors of the House of Commons they were given much more to do; in 1925 the number was reduced to five. Except for the Committee on Scottish Affairs membership is not less than thirty or more than fifty, and for bills relating to Wales and Monmouthshire members from these constituencies are added. The committees are designated by letters (A, B, C, D) with the exception of the Scottish committee. The speaker distributes the bills among them. In all but one of the committees government bills have precedence. These changes in the procedure of the House of Commons were vigorously fought by those who believed that a system of standing legislative committees struck at the principle of cabinet responsibility to the whole House of Commons. The argument was that decisions would be taken in the committees where proportional party representation was observed and that proceedings in the House would become less interesting and more perfunctory.

In the French parliament, however, an elaborate system of committees—in one sense even more elaborate and effective than that of the United States Congress—has been grafted on to cabinet government. The division of labor in continental parliaments was originally a matter of chance. The French chamber divided itself into bureaux composed of groups of members chosen by lot. For the consideration of a bill each bureau selected one or more representatives to a special committee which would examine and report on the bill. The theory was that deputies interested in a particular piece of legislation would have a chance to consider it in its preliminary stages, but in practise these special committees remained in existence for years without reporting and the burden on the individual deputy was onerous. In 1902, therefore, the chamber initiated changes in rules which looked to the creation of legislative commissions to last only for the duration of a session or of a parliament. Now there are twenty grand commissions each consisting of forty-four deputies chosen annually by proportional representation. These commissions articulate quite competently with the executive departments; indeed, one of their purposes is to control administration. Ministers appear before the com-

missions and explain not only why they desire changes of statute but also the administrative policies which their departments follow. The commissions thus have an intimate relation to the principle of ministerial responsibility. They are one of the reasons why the French ministry is so under the control of the chamber. Their absence in England may contribute to the autocracy of the cabinet.

During the World War the parliamentary commissions were particularly active throughout Europe. Efforts were made in the House of Commons to follow the French model. Immediately after he became prime minister in 1916 Lloyd George promised that the government would consider a revision of the rules, but when he heard from French ministers how annoying the commissions could be he abandoned the project. Discussion of the matter still continues with particular reference to foreign affairs and appropriations, for the control of the House of Commons is perhaps weakest over these functions. The Independent Labour party, however, has proposed the segmentation of the House of Commons into committees, one for each administrative department and presided over by the appropriate minister. It desires to give the private member of the House of Commons an opportunity to do something other than vote to support his leaders, and it intends to permit a greater parliamentary control over departmental policy. The adoption of this scheme, however, would mean the abandonment of the principle of responsibility of the cabinet as a whole to the House of Commons.

French success in using legislative committees as something of a brake on executive action was not without influence in determining certain provisions of the post-war constitutions. Ordinarily the committee organization of a parliament rests only on its standing orders. The German constitution, however, provides (article 35) for a "standing committee on foreign affairs which may act between sessions of the Reichstag and after the end of the legislative term or between the dissolution of the Reichstag and the convening of a new Reichstag"; and for a "standing committee for the protection of the rights of the representative body over against the national ministry for the period between sessions and after the end of a legislative term." Other post-war constitutions contain similar provisions. They constitute a recognition of the fact that the responsibility of the executive to the legislature can, at best, be enforced only

when the legislature is in session, and that it is the business of elected representatives to know what is going on at other times as well and to have opportunities to advise, to encourage and to warn. Furthermore, these constitutional provisions are an index of the continued nervousness of republican institutions concerning the extensive ordinance making authority which, under monarchical institutions, was exercised by executives.

It is in the United States, however, that legislative committees have been most ubiquitous and numerous. Committees were in a large measure inevitable because of the absence of any effective executive leadership or responsibility to the legislature. They furnish an obvious opportunity for members of the legislature to become influential, and in some American state legislatures the number of committees has so varied at each session as to provide each member of the majority party with a chairmanship. In 1920 the House of Representatives had sixty committees, but the real business was done by a dozen at most. The Senate in 1921 reduced its committees from 74 to 33 with no sacrifice of efficiency. Some had not held meetings for years, and in one case, that of the Committee on Transportation Routes to the Seaboard, for forty years. Such a large number of committees had been maintained solely because they provided extra clerks and committee rooms for their chairmen. When these changes were made both houses adopted rules to prevent interlocking directorates. A senator cannot be a member of more than two important committees and a similar provision is adhered to in the House. This is necessary in order to limit the concentration of power made inevitable by the uncontrolled practise of the seniority principle. This principle means that the elder statesmen have the choicest assignments, that longevity and reelections will ultimately give a congressman the senior place on a committee. If he belongs to the majority he will be chairman. If not he will be ranking minority member and a putative chairman. Only in rare cases of incompetence or unpopularity is the seniority rule disregarded.

The first House of Representatives experimented with the election of committees, but this was not satisfactory. Power of selection was then handed over to the speaker who exercised it down to the change of rules under Speaker Cannon. At present the Republicans nominate through a Committee on Committees while the Democrats use their Ways and Means Com-

mittee members, who are chosen by the Democratic caucus. The House ratifies these selections as a matter of course. The Senate views the vice president as an outsider and has always chosen its committees itself, but this means that by joint resolution the designations of the majority and minority party caucuses are ratified automatically.

The importance of committees in the congressional system can hardly be overestimated. Each committee, so far as legislative action on its business goes, exerts a no less effective control over the House than does the British cabinet. Discussion of a pending measure is more real and adequate in committee than in the House itself. American legislative committees have developed committee hearings to a far greater degree than is the case elsewhere. The voicing of grievances and the real representation of interests are to be found in these hearings.

Of increasing importance in recent years has been the inquisitorial power of Congress exerted through committees. This is particularly true of Senate committees; for the upper chamber, which is far less subject than is the House to the control of leaders, is more inclined to order investigations of the executive. Congress does not seek any day by day articulation of its legislative committees and the administrative departments, as is the case in France, but it does exert some *ex post facto* control through its inquisitions. With a reparceling of the jurisdiction of committees to correspond with that of administrative departments, Congress might be able to establish relationships with the executive which would enable legislative scrutiny to be more intelligent and effective than it now is.

Committees in American state legislatures do not vary materially from the congressional model. They are miniature, irresponsible legislatures which dictate to their creator, the legislature itself. Ordinarily they have a prior veto on the order of business to be transacted, for it is usually difficult, and in the House of Representatives well nigh impossible, to discharge a committee from the further consideration of a measure on which it is unwilling to report. The membership of a committee is always important. A committee can influence, if not control, the decisions of the parent body. Thus when places were vacant on the Senate Committee on Foreign Relations in 1919 strenuous and successful efforts were made to "pack" it with opponents of the League of Nations Covenant.

Finally the particularism of American legis-

lative chambers results in a dual committee system. Only rarely, as in the case of the Joint Committee on Internal Revenue Taxation, which in 1927 undertook the task of simplifying and redrafting the federal tax laws, will the House and Senate permit their committees to work together on the same tasks. Here also in maintaining a dual committee system state committees follow the congressional model. Massachusetts is a notable exception. Its joint legislative committees avoid duplication of effort and save considerable time.

Representatives and senators do work jointly on conference committees, which are a distinctive and important feature of the American government. When the two houses disagree on the principle or details of a bill, the differences are reconciled by a committee composed of the leading members, of both parties, of the two committees which have had the measure in charge. Concern over the extensive powers of such committees has frequently been expressed both in and out of Congress. A comparatively recent revision of the rules provides that the conference report, that is, the compromise recommended, is subject to a point of order if the conferees have eliminated anything agreed upon by both houses or have inserted new legislation. This ruling would now prevent such writing of a new bill as was done, for example, by the Conference Committee on the Tariff of 1883.

The tendency is for conference reports to be accepted even though they contain provisions unpalatable to one of the chambers. Frequently there is difficulty in reaching an agreement and measures may stay in conference for six months. Rather than prolong controversy members are frequently willing to accept provisions to which they would normally not agree. The leaders of the majority party always urge such a course, for they usually control the decisions of the committee.

While the activities of conference committees are reported by the press they are not a matter of public record. The voting of the conferees is not officially published. Reports by the committees are frequently presented in the closing days, even the closing hours, of a session, and must be acted upon hastily. It is not extreme to say, therefore, that such legislating in conference committees is as important a stage in the process as are the reports of bills by the initiating committees and their consideration on the floor. So long as the American government adheres to an extreme bicameral theory,

however, and does not impose responsibility for legislation on the executive, conference committees will remain necessary to reconcile differences between the two houses.

COMMODITY EXCHANGES. The commodity exchange has been variously defined, sometimes so loosely as to include those markets the basis of which is the proximity of the places of business of traders in a given commodity, sometimes so narrowly as to include only trading in futures contracts. As treated here the exchange is an informal or an incorporated association—more commonly the latter, formed either by special charter or under general membership corporation laws for the purpose of improving the conditions of commodity trading by and among its members. Exchanges are distinguished by the characteristic effort to make buying and selling open and competitive and by the fact that trading is typically carried on by means of samples and defined grades and by the transfer of "receipts" as good delivery.

Commodity exchanges are often confused with certain other organizations. Commodity auctions differ from exchanges in that they are typically sales of produce carried on by private companies or under governmental auspices and offer to the highest bidder goods previously listed for this purpose. Cooperative marketing associations, although they often include the word exchange in their titles, are not commodity exchanges. The essential concern of these asso-

ciations is selling the products of their members to outsiders. They have no interest in sales among members.

The membership of each commodity exchange usually includes a wide range of persons interested in the trade concerned. A list compiled from various membership rolls reveals besides commission men and brokers, who usually predominate, manufacturers, cooperatives, warehouse or elevator operators, exporters, importers, wholesalers and other merchants.

Acquisition of membership in a commodity exchange ordinarily requires two steps: first, election legal age, good character, financial soundness and a reputation for fair dealing being the usual requisites—and, second, obtaining a "seat." A seat, the member's interest in the exchange, is sometimes though not always evidenced by certificate. If membership is closed, still frequently the case though less commonly than formerly, it is obtained by purchase from an existing member; if open, directly from the exchange. Variations in the market value of seats and other costs among exchanges are illustrated by the following: National Metal Exchange (January, 1930), seat \$510, transfer fee, \$500; New York Produce Exchange (April, 1930), seat \$9000, transfer fee, \$300; National Raw Silk Exchange (April, 1930), seat \$2300, fee \$500. Fluctuations in value as a result of market conditions may be illustrated by the fact that Chicago Board of Trade seats sold for \$62,000 in the fall of 1929 and for \$15,000 before April of the following year. Government of a commodity exchange is ordinarily vested in a president, vice president, treasurer, secretary and board of managers. Special committees play an important part in administering its activities.

Such factors as geographical distribution of commodities and variations in their physical nature have led exchanges to sponsor several types of markets. Some conduct a market of each of these types, others several, still others only one. The markets which need to be distinguished are: cash or spot market, to-arrive market, call market and futures market.

A cash or spot market exists for the purpose of trading on the basis of immediate or early delivery and payment. Such markets may provide for buying by inspection, as in livestock markets, or by official samples, nowhere better illustrated than on the grain exchanges. In the sample method of trading the buyer, though guided by the grade determined by the inspec-

tors, is also influenced by the merits of the samples, which may vary considerably within the grade. Because of this variation the sample market is attractive to millers and converters.

The term "to-arrive market" is used in exchanges to refer to the sale of shipments which have not yet reached the terminal or even been shipped. Such sales are generally made through the acceptance by country elevators of bids submitted by terminal buyers. This is, properly considered, another type of cash market. Specific grade is usually contemplated in to-arrive contracts; in practically all cases delivery is made by the original seller to the original buyer; delivery period is a matter of individual arrangement, although it usually conforms to trade practise.

The call market is one in which traders, usually under the direction of a chairman, make bids and offers for given grades of a commodity. This type of market is often the leading one in the produce exchanges, particularly in trading in butter and eggs. As a rule call markets operate only for one short session each day, although sometimes additional sessions are held. Bids and offers are commonly made on goods to arrive and futures as well as on goods for immediate delivery. Although transactions are not always consummated under the call, the latter provides a basis for price determination.

A futures market is one where contracts may be made for the delivery of a "contract" grade of some commodity at a definite price at some specified future time (usually within a certain authorized month). Futures markets are the most highly developed form of trading in that practically every feature of the contract, which would otherwise call for haggling, has been predetermined by the rules of the exchange. Assuming the trade to be made in a given commodity for a certain delivery month, nothing is required but an agreement on quantity and price. Even the quantity consideration is simplified by the establishment of trading units, these being on representative exchanges: 5000 bushels for wheat, 100 bales for cotton, 2.5 tons for rubber, 250 bags for coffee, 50 long tons for sugar and car lots for eggs. Typically the rules further provide that the agreement is a basis contract which permits the seller to deliver either the contract grade or certain other grades at prices below or above the agreed price. Seventeen grades of wheat are deliverable on the Chicago Board of Trade and as many of cotton on the New York Cotton Exchange. Such a

range tends to lessen the value of the futures market as one through which dealers or converters purchase for use, but it works strongly to prevent corners and squeezes. While the method of determining the differential to be paid when something other than contract grade is delivered varies among the exchanges and is usually dictated by them, it is sometimes prescribed by law, as in the case of the federal Cotton Futures Act [38 stat. 693 (1914)]. The rules require the posting of a margin by each party to futures contracts, for mutual protection against price change. Delivery is considered to be effected by the delivery of warehouse receipts representing the requisite amount of the commodity, which must be stored in a "regular" or officially approved warehouse. While in other cases a definite lot is usually indicated, in the grain trade receipts represent only a specific grade. In a futures market it is presumed that delivery is intended, but trades may be and in a vast majority of cases are closed by other transactions prior to the date of delivery. The modern method of accomplishing this is the organization of a clearing house or association, the operations of which are analogous to those used in bank clearings. The association is usually independent of the exchange, but its stock ownership is limited to members. In effecting its work it assumes the obligations of the contracts it handles. For its members daily association clearing reduces the number of accounts requiring margins, lowers clerical costs and adds safety to accounts.

Not all types of commodities are equally adaptable to exchange methods of marketing. For sample and especially for futures trading a commodity must be relatively non-perishable, susceptible of grading and divisible into homogeneous units. The exchange method is unduly cumbersome except in cases where the volume of the commodity is great, and futures trading has no place unless supply and demand come from enough sources and are affected by enough factors to make both speculative. Yet the value of exchange methods was discovered early in modern commercial history, and they are apparently demonstrating their usefulness for an increasing range of commodities. Antwerp in the sixteenth century presented the first case of a great exchange closely comparable to modern commodity exchanges in that men made deals and effected sales of goods by description and the use of "receipts" without displaying or transferring the goods themselves. The Royal

Exchange of London was similarly advanced in the seventeenth century. It was not until the nineteenth century, however, that the commodity exchange reached its full development in Europe and in America.

The oldest of the exchanges in the United States is the Chicago Board of Trade, organized in 1848 and incorporated in 1850. All exchanges since formed in the United States have been patterned in some measure after the Chicago Board of Trade. Next in order of age are the New York Produce Exchange, organized in 1850 and incorporated in 1862, and the New York Cotton Exchange, chartered in 1871 and organized a year earlier. A list of other American exchanges selected to show variety, and in all of which futures trading is conducted in one or more commodities, is: Chicago Mercantile Exchange, with butter, egg and cheese markets; New York Burlap and Jute Exchange; New York Cocoa Exchange; New York Coffee and Sugar Exchange; New York Hide Exchange; New York Metal Exchange, with trading in copper and tin; National Raw Silk Exchange; the Rubber Exchange of New York; Memphis Merchants Exchange, with markets for cottonseed, various cereals and grain sorghums. The Chicago Livestock Exchange opened futures trading in live hogs on the first of March, 1930. There is no active futures market for poultry, but a call on poultry is held on a number of mercantile exchanges and poultry boards. There was at one time an organized petroleum exchange. Efforts to operate an organized wool exchange have not been successful in America.

Exchanges also play an important part in the economy of foreign countries. England, Germany, France, Holland and Japan not only furnish examples of exchanges for dealing in staple commodities but of others devoted to the sale of products of special local importance, such as rice in Japan, pepper, tobacco and alcohol in France, steel shapes and coal in England and oils and spices in Holland.

The services of the exchange are designed to aid members but may also be viewed collectively as constituting an important device in the operation of the existing economic order. In the interests of their membership exchanges quite generally provide a market place, regulate the dealings of members, aid in the settlement of trade disputes, establish grades and systems of inspection and collect and disseminate market information. The trading places of many of the larger commodity exchanges are owned by them

and provide rentable offices, a trading floor and equipment for facilitating trade.

Equipment varies according to the commodities dealt in and the nature and volume of business carried on. A platform, chairs and a blackboard may be sufficient for a call market; tables for displaying samples are usual in a sample market. The "pit" or "ring" is the distinctive equipment for futures trading. The usual form is a circular or octagonal platform rising from the floor by a series of three or four steps to a height of about 2½ feet and descending to the floor on the inside by as many steps. The central floor space, in some cases, as in the New York Cotton Exchange, is kept clear by a railing, behind which the traders stand upon the tiers of steps facing each other across the open space. Such arrangements make each trader visible to every other one at any given moment and aid in bringing the mechanics of pit trading to a maximum efficiency. Manual symbols aid in communication; and mere notations of trades, made on cards, are later confirmed and furnish the data for clearing adjustments.

Important among regulations are those relating to commissions, methods of trading, forms of contracts between members, delivery of grades on contract, deposits for security and settlement methods. Trade disputes among members are commonly adjusted by arbitration committees which possess judicial powers sufficient to compel the production of papers, to subpoena members and to secure testimony.

Few activities of the exchanges are of greater consequence than the establishment of grades and the maintenance of inspection to determine them. In sample trading these limit the necessity of judgment on the part of the trader to distinctions within the grade and make it possible to certify to the seller, who may be remote from the place of sale, that his commodity has been justly ranked by unprejudiced persons. They are indispensable to futures trading. While the leading commodity exchanges played a pioneer part in establishing grading and inspection, and in a variety of commodities are still dependent upon their own efforts, the work of national and state governments is now important in both activities. Outstanding among federal laws concerning grading are the Cotton Futures Act and the Grain Standards Act [39 stat. 482 (1916)]. The former, accepting the grades previously prevailing in the trade, prohibited the delivery of certain grades on futures contracts, prescribed a method of determining "differences," provided

for a system of sampling, weighing and grading by the Department of Agriculture and regulated the issuance of certificates covering the weight and grade of cotton inspected. The Grain Standards Act empowered the secretary of agriculture to prescribe uniform grades and standards for the grain trade and to exercise jurisdiction over inspection and grading. The act found the machinery of an efficient inspection service already in existence and made it part of the governmental mechanism by means of licensing. In cases of appeals grade is decided by the Department of Agriculture.

The concentration of information is perhaps the most important service which the exchange renders its members. Knowledge of demand and supply in the technical sense of quantities sold at given prices and of bids and offers made is brought by a telegraphic price reporting system covering the leading exchanges of the United States and other countries. Estimates of prospective supplies and requirements are made possible by the gathering of information on such matters as legislation, court decisions, military threats and action, production, actual and planned, crop condition, stocks held at various points, supplies en route to primary markets, current arrivals and sales. Besides obtaining information through the use of their own agencies the exchanges make extensive use of data gathered by governmental and private agencies. The larger exchanges also engage in the wide dissemination of the prices made on their floors and of other information collected.

Socially viewed, the exchange is a remarkable institutional accomplishment in an economic order in which price is of dominant significance. It constitutes the closest approximation to the theoretical competitive market yet achieved in practise. Commodity exchanges are agencies of "right" price determination. According to a competitive philosophy there is no right price other than that resulting from the trading of buyers and sellers in an open market. The exchanges provide open markets. Judgment is no better than the information upon which it is based. No agency surpasses the exchanges in the concentration of information believed to be pertinent. More specifically, the publication of prices in terms of established grades enables buyers and sellers generally to know the value of their commodities as appraised on the exchanges, thus rendering difficult exploitation through superior information. The dissemination of price information makes arbitrage possible, thus

tending to the establishment of uniform prices throughout the country or even the world. Futures market prices epitomize judgment concerning future demand and supply. These, exerting an influence on cash markets, tend to keep prices at a uniform level even for commodities produced seasonally. This in turn serves to bring about relative uniformity in consumption. The dissemination of exchange price quotations, particularly of futures, furnishes, so far as producers are pecuniarily motivated, the one best guide to production and thus to the wise social use, pecuniarily speaking, of social resources.

Additional services of the exchange are those accruing from proper grading and warehouse authorization, which, by establishing warehouse receipts as sound security, exerts far reaching benefits in financing seasonal goods; and those rendered by the futures markets, which, though furnishing less protection in hedging than has sometimes been assumed, are of great value in lessening the risks of farmers, dealers and manufacturers.

The clearest recognition of the services of commodity exchanges should not obscure their defects. As a result of criticism, well or ill grounded, certain practices believed to result in purely nominal price quotations, formerly common, particularly on the produce exchanges, have been called into court and generally modified or discontinued. Trading in futures has been widely denounced as resulting in an "uneconomic" price in cash markets. One of the several purposes of the Cotton Futures Act was to correct this alleged effect. The futures markets have been further condemned as gambling agencies and as devices of middlemen to resell products repeatedly at profit to themselves and at an increased cost to the consumer. Resulting governmental regulation has been applied particularly to grain exchanges. Between 1883 and 1921 at least 126 bills proposing to regulate trading in futures were introduced in Congress. By the latter date also the Federal Trade Commission had begun the publication of the *Report on Grain Trade*, one of the most exhaustive studies ever made of a phase of American economic activity. In 1921 Congress enacted a futures trading act, which attempted regulation through taxing power. Most of its provisions being declared unconstitutional, the Grain Futures Act [42 stat. 998 (1922)], later upheld on the basis of the interstate commerce clause, was passed in 1922.

To carry out the purposes of this act the secretary of agriculture established a Grain Futures Administration. The accomplishments of this body are summarized by the administration chief as including: publication of authoritative and comprehensive information on the activities of operators in the grain futures markets; daily announcement of the volume of trading and of the open interest in grain futures at each market; prevention of the exclusion by grain exchanges of properly organized cooperatives; the initiation of legal action to eliminate certain irregularities which it has uncovered in connection with the execution of orders for customers and which it believes to involve a violation of the rules of the exchange and to constitute manipulation.

The activities of those commodity exchanges which deal in farm products are at the moment affected by various plans and proposals of the Federal Farm Board, which was established under the provisions of the Agricultural Marketing Act of 1929. The future significance of these exchanges depends to an important degree on the permanency and policy of this board.

COMMON CARRIER. A common carrier, in Anglo-American law, is one who undertakes to convey for hire from place to place and to de-

liver at destination the goods or persons of all who may choose to employ him. At the same time, however, a common carrier may be also a private carrier, as, for example, when he transports goods which are not within the class of things he professes to carry. To become a common carrier it is not necessary that he carry as a business or as a customary course of conduct. He may be a common carrier for one shipper or one passenger, on one occasion and in one direction, if the other requisites of a delivery of the goods into his control and a willingness to serve anyone to the extent of his capacity are present.

The common carrier represents one of the few surviving common callings of feudal England. The Babylonian, the Roman and the early Germanic laws subjected the carrier to special responsibility by reason of his employment, but the English common law went so far as to thrust the particular status of common carrier upon all those who held themselves out as ready to carry for the public as distinguished from those who served only a feudal overlord. The status imposed, above all, the duty to serve the public on demand, and this has remained its chief incidence in modern Anglo-American law, despite the many encroachments of contract. The historical role of the common carrier has grown in importance with the increasing dependence of the public upon his service, and his employment has been preserved among those so affected with a public interest as to be subject to common law and legislative regulation of rates and service. It is this paramount public interest in the common carrier's service which forms the constitutional basis for state and federal regulation. A proprietor has a right to decide upon the type of common carriage in which he will engage, but as long as he furnishes the service no disclaimers or subterfuges designed to give it the appearance of private carriage can relieve him of the obligations of the status thrust upon him by the law.

The concept of common carrier in Anglo-American law has expanded with the improvements in transportation from the ancient common porter, common ferryman and common pannierman through the canal and stagecoach era to include the proprietor of the modern general steamship, railroad, street railway, incline plane cable road, taxicab, motor vehicle and airplane carrying on a public basis. Among the enterprises not within the common carrier status, although their exclusion may appear anomalous, are the horse or automobile livery,

the sleeping car and other special car services adjunct to railroad transportation, the chartered steamship, the harbor tugboat and the ordinary passenger elevator in a public or business building. On the other hand, the pipe line through which oil is conveyed by pressure has been held to be a common carrier despite the fact that the vehicle is stationary. But carriage for amusement in substantially the same place, as for example a scenic railway or an airplane which takes people for short flights, returning them to their starting point, is not common carriage. Common carriage to be such must be carriage in the sense of a journey, whether undertaken for recreation or business.

The great duties of public service attaching to the status of common carrier are to render to the public on reasonable demand a reasonable service at reasonable rates and without unreasonable discrimination. The common carrier must accept and carry goods or passengers tendered to him in proper condition if they fall within the class of carriage he professes, even though they may be destined to points beyond his route. The common carrier of goods is protected in his charges by a common law lien upon the particular shipment. The duty to render a reasonable service includes the duty to provide reasonable facilities for the type of carriage undertaken. The early common carrier devoted his vehicle to the public service to the extent of its capacity and was not compelled to furnish additional facilities to meet increased demand for his services. But the modern railroad carrier, who provides not only the vehicle but also the roadway which his vehicles alone may use, is required to furnish additional equipment and facilities adapted to the transportation of all such goods and passengers as he should reasonably anticipate may be offered along his route.

The relation of common carrier of goods or of passengers is established as soon as the goods or passengers come into his custody for immediate transportation at the place designated by him and within a reasonable time before the departure of his conveyance. If he is a carrier of goods, the law subjects him to an "insurer" or non-fault liability for loss or injury of the goods carried. The common carrier of passengers is not subjected to non-fault liability except for such baggage as is delivered into his charge. This seems but a survival of the early common law absolute liability of all bailees, which although stringent was made necessary because carriers, by the very nature of their service, had

opportunity to collude with thieves and also because it was difficult to prove their defection. At common law only five excuses were recognized: act of God, act of the public enemy, act of public authority, the fault of the shipper and vice of the goods. Today the carrier may avoid the non-fault liability by a valid contract with the shipper; mere notice to that effect, however, is insufficient. The carrier may not limit his responsibility for negligence, although a limitation of liability to the shipper's declaration of value as a rate base is lawful. It is generally said of wharf to wharf or station to station carriage that the relation of common carrier and shipper, with its coexistent non-fault liability, shifts to the relation of warehouseman and depositor, with its lighter duty of due care, whenever the carrier withholds the goods from transportation or stops them in transit at the shipper's order or when he has deposited them in a safe place at destination. Although the attempt to relieve the carrier of a harsh absolute liability under circumstances where it is no longer justified is understandable enough, it is a fiction to say that the carrier has become a warehouseman. A better explanation would seem to be that the relation of common carrier and shipper continues until delivery to the consignee, but that the incidents of liability within that relation shift.

Although the concept of common carrier has found no place in civil law countries it is approximated in practical effect. This development was long delayed by a contradiction in the Roman law, as a result of two passages of Ulpian in the *Digest* (*Corpus juris civilis, Digesta*, Lib. 4, tit. 9, 1, 1; Lib. 4, tit. 9, 7, 1; Lib. 47, tit. 5, 1, 6) as to the ship carrier's duty to serve on demand, the older view adopting the interpretation denying such duty. As far as the liability of carriers for the safety of goods is concerned, the Roman law for the same reasons as the common law imposed it upon some carriers, usually those operating by water, and without any distinction as between private and common carrier. It permitted, however, the broader excuse of *vis major* under which only superior force or inevitable accident could be pleaded. In mediaeval Europe the many principalities levying tribute, the incessant warfare, the barrier of the Alps, the dearth of highways and the distance between markets all operated to force commerce to the seas and facilitated the reception of the Roman law as to carriers, perpetuating for centuries the ancient limitation of non-fault liability to the sea carrier with no duty of public service. Later

the growth of commerce and the increasing need of general carriage for the public led to a new interpretation of the Roman texts in harmony with the early Germanic concept of a paramount public interest and the recognition of certain types of "necessary carriers" subject to non-fault liability and to the duty to serve on demand. That the law of carriage has not developed into such a comprehensive system on the continent as it has in Anglo-American law is due chiefly to its rapid codification in the first half of the nineteenth century, as well as to the fact that the continental railways have been in part at least built and operated by the respective governments rather than by private capital as in England and America.

COMMON LAW. Used in its broadest sense the common law is the legal system of England and most English speaking lands, as distinguished from the civil law, or modern Roman law system, which prevails in continental Europe and parts of the world colonized therefrom. It obtains in England and Ireland; the United States, except Louisiana, Porto Rico and the Philippines; Canada, except Quebec; Australia; New Zealand; India, except over Hindus and Mohammedans as to inheritance and family law; and the British colonies other than those settled

originally by the French or the Dutch. It gets its name from the mediaeval judicial theory that the law administered by the king's superior courts was the common custom of the realm, as contrasted with the custom of local jurisdictions.

There are other uses of the term which must be distinguished. One, closely related to the broadest meaning, is to designate that part of the law in any English speaking jurisdiction which is traditional in form, i.e. to be found in reported judicial decisions and in textbooks discussing those decisions, as distinguished from the part which is in the form of statutes. In the same way in continental Europe the modern Roman law, which is a common traditional element in the laws of the several nations, is called the common law. Sometimes also the term is used to mean that part of the law, in some English speaking jurisdiction, which grew up and is administered in courts of law and proceedings at law, as distinguished from the part administered in courts of equity or in proceedings in equity. Occasionally it is used to mean the older course of decision in the courts in English speaking countries, or only in England, in contrast to that which obtains today. The tendency to think of law as no more than a body of rules, a tendency which has come down from the twelfth century conception of Justinian's law books as bodies of enacted rules binding on all Christendom, leads to confusion between the system of law which grew up out of the administration of justice in the king's courts and the particular bodies of rules which may have been or are enforced in those courts.

A system of law as distinguished from a body of rules of law is only possible with and after the rise of a legal profession and the development of law teaching. There can be a legal system only when professional lawyers and law teachers begin to distinguish cases and find principles behind their distinctions, to work out and teach and hand down a technique of interpretation and application of legal precepts and of deciding cases, and to give definite formulation to the ideals of the social order as measures of interpretation and application. In the history of each of the systems of law which have developed thus far, namely the Roman, the modern Roman and the common law, three things have occurred at a crucial point. In each case secularization of justice, rise of a legal profession and development of law teaching took place simultaneously and marked a turning point. In English law these things had taken place in the thirteenth

century and from that time the history of the common law as a system begins. The supremacy of the king's courts, which made the common law possible, may well be dated from the Constitutions of Clarendon (1164), which put definite and narrow limits to the jurisdiction of the ecclesiastical courts. This hastened the secularization of justice. The rise of a lay legal profession and of an organized teaching of law in the Inns of Court, or self-governing societies of practitioners in the king's courts, completed the process which the limiting of the jurisdiction of the church courts and the secularizing of justice had begun. As Maitland puts it, taught law is tough law. On the whole, rules of law are relatively short lived. Legal doctrines are long lived.

A body of law is made up in part of an enacted element and in part of a traditional element. From time to time the traditional element or some portion of it is reduced to legislative form. On the other hand, a judicial or doctrinal gloss gradually grows up about all legislation of much legal importance and thus turns it back into the stream of legal tradition. Thus the traditional element is in the long run the more important. Systems of law are systematizings or organizings of tradition. Bodies of law, however, are much more than aggregates of laws or of rules of law, much more than bodies of precepts prescribing definite detailed legal consequences for definite detailed states of fact. In a large view two constituents of any developed body of law are of much more importance than the existing rules: first the traditional technique of finding the grounds of deciding cases, and second the traditionally received ideals of the social order and so of the legal order, and as to what legal precepts ought to be and how they should be applied. The traditional organization of this technique and of these received ideals distinguishes a system of law. The element of technique in law—the art, as one might put it, of the lawyer's craft—is especially important. The technique of developing the grounds of deciding particular cases out of the authoritative legal materials, of shaping precepts to meet new situations and developing principles to meet new cases, and of working out from the body of legal materials as a whole the precepts appropriate to concrete controversies as they arise, is differently but characteristically constituted and organized in the two legal systems which divide the world of today, and it is this technique which sets off the two systems decisively rather than any thoroughgoing differences in rules or institutions.

There are two constituents in the traditional legal materials of continental Europe, the Roman and the Germanic. The Roman element is partly a survival from the time when the Roman law was the law of the world and obtained as a living system, especially in southern Europe. But the significant part of the Roman element is the result of the systematic study of Justinian's codification of Roman law which was carried on first in the Italian universities in the twelfth and thirteenth centuries and has gone on in the universities on the continent down to the present. The Germanic element is a result of the customary law of the Germanic peoples which spread over Europe after the downfall of the empire, developed independently but under the influence of the Roman tradition, and was largely made over by and incorporated into the modern Roman law by systematic study and doctrinal writing in the universities. The common law is Germanic in origin. It too developed independently, although under not a little Roman influence, especially through the canon law, which was highly Romanized, as was the Germanic element in the law of continental Europe. The systematizing and organizing took place not through doctrinal writing and university teaching but through judicial decision. An independent working out of a law of property in land and of a legal procedure, the latter not along the lines of the canon law as on the continent but fitted to the exigencies of trial by jury, insured a characteristic English legal tradition. As modernized in the seventeenth and eighteenth centuries this tradition has gone round the world.

What is important for the present purpose is not so much the incidental borrowings from time to time of particular legal precepts from without as the extent and continuity of the indirect influence of the civil law system. Sometimes it furnished models where common law institutions or doctrines were formative. But chiefly it has at all times been a stimulus to systematic development: in the Middle Ages through the canon law and the study of Roman law in the universities; in the sixteenth and seventeenth centuries through the humanistic ideas of the time and the effect of continental administrative institutions during the Tudor and Stuart polity; from the seventeenth to the nineteenth century, during the absorption of the law merchant, through the continental treatises on commercial law; and in the nineteenth century through the influence of the systematic

treatises on the modern Roman law upon text writers in England and America who sought to organize the materials of English case law by the systematic ideas of the pandectists. On the other hand, the common law tradition succeeded in making over the foreign materials to its own lines. Equity, admiralty, probate and divorce and to a large extent the law merchant began their development outside of the common law with civil law materials and methods and technique. They were worked into the common law tradition quite as thoroughly as the Germanic materials were worked into the modern Roman law tradition of continental Europe.

Legal theory has it that the colonists brought the common law of England with them to America. But for a long time the colonists had no need of so advanced and technical a body of precepts as the seventeenth century English law. It was not until the eighteenth century that there was a need for courts manned by lawyers and for trained lawyers to advise litigants and assist the courts. Before the American Revolution two circumstances made for a reception of the English common law in the colonies. One was economic. Expanding commerce, acquisition of wealth and the rise of a more complex social structure called for tribunals of another type from those which sufficed for the beginnings of the colonies. About 1700 colonial legislation began definitely to run an independent course, but economic growth became too rapid for legislation to meet its demands. The other circumstance was political. The conditions which later led to the revolution caused the colonists to insist on the common law as a birthright, protecting them against the crown, the royal governors and even Parliament. The contests between the courts and the Stuart kings had put the courts in the position of standing between the crown and the subject, and the courts had taken their stand upon the immemorial common law rights of Englishmen. A legal theory of Magna Carta, which had grown up in the courts, was developed into political as well as legal consequences in the writings of Coke, the oracle of the common law. Wherever there was friction between the colonists and royal governors, or between colonial legislatures and the crown, Coke's writings were a basis of argument on behalf of the colonies. The very events which were separating them from England politically tended to make for a reception of the common law.

For some time after the revolution a number

of causes operated to hold back an immediate and complete reception of English law. One was the condition of the law at that time. When Blackstone wrote, around 1765, English law was still fundamentally mediæval. It still thought and spoke in terms of a society organized according to relations which no longer existed in England and had never existed in the colonies. It was needful to reshape the authoritative legal materials to the demands of an era of competitive individualism. In England they had to be made over to the needs of an industrial society. In America they had to be reshaped to the needs of an era of exploitation of the natural resources of a new world, to the needs of a rural, agricultural society differently organized from that of mediæval England, and to the demands of pioneer commonwealths newly set up in successive waves of westward expansion. Thus the reshaping of the classical English legal materials followed parallel lines in England and America at the end of the eighteenth century and in the first half of the nineteenth century. Another cause for the slowness of reception may be found in Puritan views as to law and lawyers. Under the Stuarts the Puritans had experienced English administration of justice at its worst. They had seen a bar more attached to the crown than to the law. They had seen the tenacity with which the lawyers resisted Cromwell's projects of law reform. Accordingly they distrusted law and lawyers. The attitude of the Puritan clergy was a large factor in holding back the general reception of the common law, which ultimately took place. But the cause which chiefly operated against reception was the political feeling in America after the revolution, aggravated by the bad economic situation of the time. The common law was under suspicion in an era of hostility to all things English. Lawyers were suspected because they alone seemed to thrive in a time of depression. A strong and presently dominant political party was enthusiastically attached to France. For some time there was an inclination to urge reception of French law. French legal authorities stood high in many states. Until near the end of the nineteenth century it was not certain that a great body of states might not abandon the Anglo-American legal tradition and enact codes. Had there been generally available translations of French law books, the course of American legal history might well have been different; but few such books were translated and most of those translated were too late. Kent's commentaries (1826-

30) and above all the writings of Story between 1832 and 1845 started a current of law writing on the basis of English legal institutions which insured that the common law should be the basis of the law in all but one of the United States.

It is usually said that the common law as it stood at the time of colonization is in force in America today so far as it is applicable to American conditions, accordant with American constitutions and unchanged by legislation. Statutes expressly adopting the common law as the basis of the law of particular states frequently fix the date of adoption at the first year of James I, and in the absence of statute that is the legally accepted date. But in this doctrine and in these statutes the term common law is used in two senses. In consequence the courts have encountered some difficulties in applying them.

The English materials as the colonies received them were for the most part set forth authoritatively in the writings of Sir Edward Coke, attorney general under Elizabeth and chief justice under James I. Yet the common law of England, in the sense of the traditional body of legal precepts administered in the king's courts of law, continued to develop throughout the seventeenth century and in the eighteenth century. Also the common law as a system had an important development in England in the nineteenth century. If the statutes limit American courts to the English legal precepts as they stood in 1601, the traditional element of the law would have to stand still in America in its early seventeenth century form, while going forward in England. Thus the courts would be seriously hampered in dealing with many subjects where, in default of legislation, resort must be had to the common law. Hence, although some courts insist that in the absence of statutory rules they must apply English decisions as they stood in the first year of James I, the tendency of American decisions is to hold that the doctrine and the statutes refer primarily to the common law as a system. On this ground courts consider that they may refer to recent English decisions, as against the seventeenth century authorities, if the former are better expressions of the principles of the common law system. English law, as it stood at the beginning of the seventeenth century, had to do almost wholly with property in land and with procedure. Some of the most significant doctrines and important departments of American law arose after that date. It was

only by assuming that the common law as a system is referred to, and by treating English decisions in the nineteenth century as affording materials for American judicial development of the traditional element, that the reception of the common law by statute or decision fixing the date at colonization could have been made tolerable.

It must not be overlooked, however, that the United States received much more than the system. It received also a body of authoritative legal materials both as the basis of its legal tradition and as a body of rules for the cases to which they were applicable and appropriate, until superseded by legislation. In the latter sense there are six forms of the common law in this country. First and most important, there is the body of English decisions and English books of authority prior to colonization. Only these are in legal theory of binding authority. The later English decisions are said to be of "persuasive authority." They are to be followed so far as they commend themselves to the courts as well reasoned, as in accord with the general body of common law doctrines and as harmonious with common law principles. Second, there are English statutes before colonization and certain English statutes between colonization and the revolution. The former are part of the American common law so far as applicable to conditions in this country. The latter are part of the American common law only where they were enacted to be applicable to the colonies or have been received as part of our law. Third, the law merchant, or universal custom of the commercial world, is said to be a part of the received common law. This custom of merchants was absorbed into the general body of the law and made over by judicial decision from the seventeenth to the nineteenth centuries. Much of the process of remaking went on parallel in England and the United States, in each case not a little influenced by the continental writers on commercial law. Today the subject has for the most part been put in legislative form. But the law merchant is the background for the interpretation and application of the statutes. Fourth, certain parts of the canon law are said to be common law in America. Those parts of the canon law applicable to probate and divorce which obtained in the English ecclesiastical courts were, so far as applicable in America, received as part of its inherited law. Fifth, the courts hold that on the appropriate subjects international law, as a body of universally recognized

precepts among civilized peoples, is a part of the common law. Finally, the books speak of customs. The type of local custom which was formerly important in England has never existed in America. But the mining customs which grew up on the public domain after 1849 became the foundation of the mining law and law of water rights in the western states and are in that sense a part of the common law in that part of the country.

In the economic order of today unity and harmony are necessary in law and administration, whereas a century ago these might well vary with each locality. Today state lines rarely coincide with economic lines. A regime of local legal units pulling in different directions or indifferent to each other's needs and not pulling together had no serious results when it mattered little outside its own jurisdiction what any one of them was doing. As things are, such a regime is wasteful. It is significant that the subject of conflict of laws has become one of the chief titles of the law in the United States. There is now an elaborate body of rules and doctrines for ascertaining, as among the divergent and discordant laws of forty-eight states, which local law is applicable to situations and transactions that increasingly transcend state lines. Obviously there is economic waste in these bodies of divergent local laws, potentially applicable to every business and every economic activity of any consequence. As to legislation, a partial remedy has been found in the Conference of Commissioners on Uniform State Laws and the uniform statutes on commercial subjects enacted as a result of its labors. But the provincialism of local legislation on matters of national concern and discordant local regulations of nation wide enterprises are still things with which the business man must reckon. Legislation had had no common basis, except as afforded by imitation of the statutes of other states, until the activities of the Conference of Commissioners on Uniform State Laws at the end of the nineteenth century. On the other hand, in that part of the law which is in the form of reported decisions of the courts the common law has been an effective unifying agency. National law schools, teaching the common law as a system and criticizing local anomalies of decision, have done much to mitigate the results of a system under which the highest court of each state is a final arbiter on all questions of law not committed by the constitution to the federal government. The importance of the common law as a unifying

agency in a time of economic unification is obvious.

There would, no doubt, be general agreement that the characteristic institutions of the common law are the method of judicial precedents, trial by jury and the doctrine of supremacy of law. Each of these has had its vicissitudes in English and American legal history and each is more or less under attack in present day America. But each has endured, and these three institutions seem to set off the Anglo-American legal system as definitely as reliance upon texts, piecemeal trial and a Byzantine conception of the relation of the state official to the law mark the civil law system. They must be considered in generalized form, however, if they are to be regarded as institutions of the English speaking world. The enduring element in the doctrine of precedents is the application of reason to judicial experience rather than to legislative or juristic texts. Its significant feature is reliance, for authoritative legal material, on judicial decision of actual controversies rather than on legislative or juristic formulations of abstract propositions. Thus the common law is a law of the courts as distinctly as the civil law is a law of the universities. In form it is expressed in the law reports. Its exponents are the judges. On the other hand, the civil law, since fifth century Rome, has been in form (or in the theory of its form) a body of legislatively declared or prescribed texts interpreted by jurists. Its exponents have been academic teachers, jurists and commentators. The technique of the common law is one of finding the grounds of decision of cases in reported decisions of past controversies; that of the civil law of finding them in written texts and commentaries thereon. As the doctrine of precedents stands in America today, only the decision of the highest tribunal of the jurisdiction in which the case is before the court has binding authority. Such decisions, precisely governing, are at hand only for everyday situations, since changes in the social order, inventions and discoveries make most of the decisions of the past inapplicable after a short time except as the basis of analogical reasoning. Thus as to much of its work a common law court is remitted to the decisions of the courts of other English speaking jurisdictions, which are only of "persuasive" authority. For any difficult problem the court may draw upon judicial experience, past and present, in the whole English speaking world, without being bound by any particular formulation. This gives to the common law the flexibility required to

meet the demand for change, while the traditional technique and the prescribed application of it to authoritative materials, when there are any, give the reasonable certainty and uniformity required to meet the demand for stability.

As to trial by jury, it may be admitted that the civil jury seems to be slowly dying out in England while signs that it is moribund are not wanting in America. The enduring element is to be found in the mode of hearing cases and determining issues of fact which grew up in the common law courts and was given shape by the exigencies of a jury. Here, at any rate, is a legal institution full of life. When in 1913 the federal Equity Rules definitely set aside the civil law methods of proof borrowed by the Court of Chancery from the procedure of the church and set up for federal courts in equity cases the method of oral examination and cross examination of witnesses in open court and of hearing the case as a whole, which had developed out of jury trial, they rejected an exotic feature of Anglo-American procedure and provided a wider operation for a characteristic common law institution.

As to the doctrine of supremacy of law, it will require separate and fuller treatment than may be given to it here (see RULE OF LAW; JUDICIAL REVIEW). In its most general form it is the doctrine that all agencies of government are bound to act upon principles and not according to arbitrary will and that to this end their acts are subject to scrutiny in ordinary legal proceedings. It assumes an accepted ideal that those who wield governmental powers and their agents are not free to follow their own wills, wherever mere will leads them, but are held to act upon principles and follow reason. A like received ideal is behind the doctrine of precedents. Thus Coke could say that "the common law is nothing else but reason."

It must be admitted that the results of the judicial development of the law by the common law technique are less satisfactory under the conditions of today than during the formative era of American institutions. In the country as a whole the crowded calendars of the appellate courts preclude the thoroughness in presentation and deliberation in judicial study which are postulated by a regime of judicial finding of the law. The time allowed for argument has had to be restricted. It is no longer possible, even in cases of the first magnitude, to hear counsel until every detail has been gone into fully in argument. Nor can the judges take such time as they

feel to be required for each individual case. To keep up with their calendars they must work rapidly and with a minimum of deliberation. Thus at a time when constructive work is called for and adjustments of the law to changes in the economic and social order are pressing upon the courts, the pressure of business operates to make the common law machinery of lawmaking much less effective. It is no easy task to adjust the received ideals and authoritative traditional legal materials, as they were given shape for the pioneer, rural, agricultural society of the formative era, to the urban, industrial society of the present. Much of the dissatisfaction with the common law manifest in the present century is due to the persistence of modes of legal thought appropriate to pioneer, rural communities, in judicial passing upon and application of the social legislation of the nineteenth century.

Five elements have contributed to make difficult the application of American judicial and professional thinking to the industrial and social problems of the time. In chronological order these are Puritanism, the idea of law as standing between the abstract individual and society and protecting the former from the latter, the philosophical theory of natural rights, pioneer ideas and the abstract individualist philosophy of law of the last century.

Puritanism put individual judgment and individual conscience in the first place where the traditional modes of thought had put authority and the reason and judgment of the prince. This mode of thinking on religious and political questions entered into legal thinking during the contests between the courts and the crown in seventeenth century England. When the colonists came to insist on the immemorial common law rights of Englishmen, as against the crown and Parliament, those rights were identified with the natural rights of man. Thus a continental philosophical theory got a concrete content of English law. The resulting tradition of legal thought was congenial to pioneer America. The pioneer was jealous of government and administration and had a rooted dislike of supervision. The conception of the common law as standing between the subject and the crown became in his mind one of the common law as standing between the individual and society. Puritan and pioneer, using the legal doctrines fashioned in the contests between courts and crown, were able to devise checks which proved effective against American social legislation for more than a generation after British lawmaking had

changed front. Finally, the nineteenth century philosophy of law, developed in continental Europe, was used to organize the result and give it the toughness of a taught tradition. Happily the idea of relation, by means of which most of the authoritative Anglo-American legal materials had taken their original shape, is well adapted to the demands of a regime of cooperative activity as contrasted with one of competitive self-assertion. Two things are likely to make the common law as a system an enduring basis for American law both in and after the transition: its technique of finding the law through judicial experience and its conception of rights and duties as involved in or incident to relations.

COMMON LAW MARRIAGE. A common law marriage is one which has not been solemnized in any particular form, being based only upon the mutual assent of the parties. It is thus a marriage which does not depend for its validity upon any religious or civil ceremony. It is an unlicensed, an unrecorded and non-ceremonial marriage.

There is now little doubt that common law marriages were recognized in England until the passing of Lord Hardwicke's Act in 1753 (26 Geo. II, c. 33). This is clear from the practise of the ecclesiastical courts, which by the twelfth century had established their jurisdiction over marriage. In these courts a distinction was drawn between *sponsalia per verba de presenti*, that is, words between man and woman presently to become husband and wife, and *spon-*

salia per verba de futuro, promises to become husband and wife in the future. A present agreement to become husband and wife or an agreement to constitute such a relation in the future, followed by sexual intercourse, created a marriage which the ecclesiastical courts regarded as complete in substance but not in ceremony; and the parties might be compelled to have the ceremony performed *in facie ecclesiae*. If the marriage were so celebrated the temporal courts would hold it good for all purposes *ab initio*. The mutual assent of the parties constituted the *vinculum* and made the contract *verum matrimonium*. But even without the subsequent performance of a religious ceremony the marriage was good for many purposes. Before the ceremony the woman was not entitled to dower; but the children of the marriage, while not entitled to inherit property, were regarded as legitimate.

Indeed, non-ceremonial marriages were quite common throughout mediæval Europe. They were abolished, however, in all Catholic countries by the decrees of the Council of Trent, 1545-63, which required all marriages thereafter to be contracted in the presence of the parish priest and "two or three witnesses." But due to the non-reception of these decrees in Protestant countries the reform there was delayed until the eighteenth century, when religious ceremonies generally came to be required. Thus Lord Hardwicke's Act in 1753 came comparatively late in England. Under the terms of this act all marriages save those of Quakers and Jews were to be celebrated only after publication of banns and in the presence of an Anglican clergyman. It was, moreover, expressly provided that "in no case whatsoever shall any suit or proceeding be had in any ecclesiastical court in order to compel celebration of marriage *in facie ecclesiae*, by reason of any contract—whether *per verba de presenti* or *per verba de futuro*." However, as the act was made to apply only to England and not to Scotland there began the migrations over the Scottish border which resulted in the famous Gretna Green marriages.

The celebrated leading case of Dalrymple v. Dalrymple [2 Hagg. Const. Rep. 54 (1811)], which contains the judgment of Lord Stowell, upheld common law marriages in Scotland after Lord Hardwicke's Act and asserted their validity in England prior thereto. But in the famous cases of *The Queen v. Millis* [10 Cl. & F. 534 (1843)] and *Beamish v. Beamish* [9 H.L.C. 274 (1861)], decided by the House of Lords, where

the question of common law marriage in Ireland was raised, the thesis was maintained "that by the ecclesiastical and the common law of England the presence of an ordained clergyman was from the remotest period onward essential to the formation of a valid marriage." Misinterpreting certain old cases wherein the children of such marriages had not been allowed to inherit property the judges erroneously took the position that such children were illegitimate. "If," says Maitland, "the victorious cause pleased the lords, it is the vanquished cause that will please the historian of the middle ages."

There exists much uncertainty concerning the development of common law marriage in the United States. Certainly the act of 1753 did not apply to the dominions beyond the seas, and in most of the colonies there existed statutes which required for a valid marriage the presence of a certain official. The leading authorities are not in agreement, however. Apparently, according to Howard, the informal marriage was valid in the absence of an express statutory provision declaring it null and void. In this he is supported by Professor Ernest Lorenzen. F. G. Cook, in a fine series of articles, has stated his belief, however, that the colonial statutory system entirely superseded the common law. Certainly there are no decisions of importance during the colonial era. When after 1776 the English common law was retained as a part of the law of the land, unless expressly superseded by constitutional or statutory provisions, almost everywhere statutes prescribed the necessary marriage formalities. In many jurisdictions, however, marriages performed in disregard of them were upheld, the statutory provisions being construed as "directory." In the leading case of *Fenton v. Reed* [4 Johns. (N. Y.) 52 (1809)] Chancellor Kent accepted as binding a common law marriage, declaring that no ceremony or solemnity was requisite. This case exerted a great influence upon the subsequent decisions in other jurisdictions. On the other hand, Judge Parsons, in *The Inhabitants of the Town of Milford v. The Inhabitants of the Town of Worcester* [7 Mass. 48 (1810)], also a very influential decision, refused to recognize the validity of common law marriages in Massachusetts, although the statute did not provide that marriages contracted against its formal provisions should be void. In any event, it is clear that the English doctrine has not been received in this country in full because there

has been no recognition of a marriage *per verba de futuro cum copula*. Only present agreements to become husband and wife have gained recognition. Furthermore, there has been a dispute as to whether cohabitation following the agreement is a prerequisite to the existence of a valid common law marriage—which was certainly never the case in England.

At the present day common law marriage would seem to be recognized in the following American jurisdictions: Alabama, Colorado, District of Columbia, Florida, Georgia, Idaho, Indiana, Iowa, Kansas, Michigan, Minnesota, Mississippi, Montana, Nevada, New Jersey, New Mexico, New York, Ohio, Oklahoma, Pennsylvania, Rhode Island, South Carolina, South Dakota, Texas and Wyoming. There would seem to be no common law marriage, either as the result of statute or judicial decision, in Arizona, Arkansas, California, Connecticut, Delaware, Illinois, Kentucky, Louisiana, Maine, Maryland, Massachusetts, Missouri, Nebraska, New Hampshire, North Carolina, North Dakota, Oregon, Tennessee, Utah, Vermont, Virginia, Washington, West Virginia and Wisconsin. Statutory modifications of common law marriage in the various states make it difficult to predict what view any given court will take of an informal union.

When one considers the prevailing system of statutory formality and record, reflecting the present increase of interest on the part of the state and society in the institution of marriage, it would seem an anachronism that at least one half of American states are willing to recognize the validity of a marriage solely on the basis of the statement by a man and a woman that they are husband and wife. Such a practise must be conducive to instability of marriage and thus fosters the very evil which the statutory requirements of license issuance, registration and public administration were designed to prevent. Of necessity the standard of record for all marriages is thereby lowered. The difficulty is increased by the fact that no two states are in entire accord as to what constitutes a common law marriage. Nevertheless, there is a deep rooted sentiment in various parts of the country in favor of the institution. This is due to the feeling that innocent children ought not to suffer because their parents have neglected the statutory formalities and that refusal of sanction to an informal union constitutes an invasion of the most sacred right of the individual. It is true that by means of a common law marriage

many marriages are upheld which otherwise due to some impediment would be void. Frequently, however, the judicial determination of the common law relationship comes at so late a date—perhaps after the death of one or both of the parties, when the evidence is difficult to obtain—that there is little truth in the popular idea that it furnishes “protection.”

The existence of common law marriage often opens the door to blackmail. After the death of a man it is frequently possible for his mistress to claim the rights of a common law wife. On the other hand, if the claims based upon illicit relations are presented during the lives of the parties, a subsequent ceremonial marriage of one of them may be made bigamous and the children bastardized. The recognition of common law marriages thus involves fundamental moral and practical dilemmas. The experience of the Federal Bureau of War Risk Insurance with many claims of informal unions is particularly interesting. The family allowances granted to wives of soldiers resulted in the filing of many applications by women who claimed to be common law wives but who, in the opinion of the officials, had in the majority of cases little right to the title.

Common law marriage has been abolished not only in England but in continental countries, where, moreover, obligatory civil marriage began to prevail after the French Revolution. The present tendency would indicate the gradual but ultimate abolition of common law marriage in the United States as well. It is opposed by the American Bar Association, by the commissioners on uniform state laws and by leading sociological authorities. Of the states which have abolished common law marriage New York is the only one to bring it back, the section of the laws of 1901 which did away with common law marriage having been inadvertently repealed in 1908.

COMMON SENSE has three discernible meanings denoted roughly by emphasizing “sense,” by emphasizing “common,” by taking the two together as a single notion. This order represents in general the order in which the meanings arose. Aristotle thought of a sense or organ that, while incidentally possessed by all civilized men, had a definite function to perform, the function of correlating all the other human senses into an operative unity. In reaction to the invidious classical attitude toward slaves and barbarians, the stoics thought to find in all men, irrespective of class distinctions, some basic identities. Since they shared with Plato and Aristotle the notion that man is rational, the common element must be regarded as “sense”; but it was the community rather than the rationality that caught and held their attention. The existence of something common to all men conditioned their whole social philosophy and was guaranteed by their metaphysical belief that all souls arose from a rationality in nature itself and shared as common what made the world soul unitary.

Precisely what this was that made men alike and entitled them to equal consideration was and is subject to various interpretations. It might be thought of as a common stock of ideas innately present as the initial equipment of all human beings; it might be regarded as an identical content presented alike to all minds through experience (see RATIONALISM); or it might be considered a common reflective activity whereby men confront nature with diverse patterns for the purposive direction of otherwise purposeless change (see PRAGMATISM). But since human interest centers eventually neither in ideas nor in things but in judgments or convictions that relate the two, common sense acquires beliefs for content. Beliefs that are genuinely common are really so uncommon, however, that once found, or presumed, they easily pass from descriptive to honorific use; and in popular parlance common sense becomes good sense which to have implies praise, which to lack (although by hypothesis none lacks it) implies blame. It was foregone indeed that motivation sufficient to postulate something common in the face of such thoroughgoing

empirical diversity as men illustrate would use the postulation for purposes of privilege.

John Locke's attack on innate ideas as constituting what is common to men was definitely related to his own notion as to what concrete privileges men ought to share. He wanted to rid the world of a common sense decreed before birth to be the nesting place of authority and to put in its place a common sense empirically engendered and therefore open to influence from him and others who shared his beliefs. (The current onslaught against instincts illustrates a similar social attitude.) But when Locke's empirical emphasis eventuated through Hume into a skepticism that left neither soul nor God secure, a reaction set about to recover under the name of common sense long cherished beliefs. The resulting Scottish common sense validated such beliefs as that the soul and God and the external world exist. Before such beliefs reason must stand either acquiescent or disowned. Operating from the same religious base and against the same skeptical English empiricism, Kant found in such limitations as space, time and causality the common negative obstacles to freedom that drive men for refuge to common positive faiths in universal moral law and in presumed religious verities. These debits and assets are common to men as men and furnish therefore to even average persons who are not reflective a feeling of stability and a sense of direction.

Common sense, then, connotes both an avenue to elemental truths and the system of elemental truths thus achieved. As an organ of knowledge it never gets clearly defined and so lends itself easily to the descriptive psychology of any previous generation. As a system of beliefs, common sense at present in the Occident represents such religious elements as belief in the existence of God and the immortality of the soul, such scientific ideas as that (nearly) everything has a natural cause, such political propositions as that every adult (male at least) is entitled to one and only one vote, such economic notions as that of equality of opportunity and such cultural concepts as that of the superiority of one's own country. But the foregoing historical reflections suggest that these contents are subject to revision without notice, although they never get revised overnight. What remains through all change of content seems to be a vague feeling that there is something common in the nature and equipment of men that entitles them to claim, regardless of differ-

ences, a certain minimum of privilege and opportunity.

Common sense is thus potentially as much the matrix and sanction of political institutions and economic factors as of moral code and religious faith. It is in general a conserving agency, standing, in the person of the average man, doggedly against innovations and new ideas that disturb his composure or seem to threaten his small segment of security. It approves whatever practices have become well established and, if pressed, justifies them by articulating the assumptions of daily life. It disdains the expert and looks with suspicion upon discussions that involve novel ideas or move in terms not familiar. It represents the habitual and dimly conscious side of individual and social life. As such it is the ideational agency involved in the phenomenon of institutional law. But it is not wholly without relation to individual growth and social progress. For among the stereotypes that serve as content for common sense there are found also vague but insistent intuitions of welfare, of rights and duties, in short, a sense of justice. The course of the common law memorializes both these aspects: it has been on the one side cosmically embodied reason to be discovered and acknowledged; but it has been on the other side the insight of judges on issues in doubt. When institutions press too hard upon humble folk they achieve gradually in popular consciousness an inimical isolation; and common sense turns revolutionary—conserving still, however, the presumed welfare of the many and justifying rebellion with the same stereotypes now turned against constituted authority. The basic appeal, however, in such situations is likely to be to something deeper than any human opinions, to nature herself, as in Thomas Paine's famous pamphlet *Common Sense*.

It is an indication of the deep hold that the democratic ideal has upon modern life, particularly in America and Great Britain, that common sense is rather uniformly used in a eulogistic fashion. This is all the more remarkable since common sense does not ordinarily talk about itself. Indeed, it is almost literally true that one set of men have and use it and another set of men talk of and write about it. Since the heyday of the Scottish philosophy it seldom describes the articulated beliefs of philosophers or social scientists. They will normally represent themselves as intellectual and critical, but will actually disbelieve the basic judgments of common sense

and disapprove its conservatism. And yet they will seldom speak of it except eulogistically. George Santayana, for instance, in the introduction to a recondite and highly sophisticated volume (*Skepticism and Animal Faith*, New York 1923) declares that "common sense, in a rough and dogged way, is technically sounder than the special schools of philosophy." Franz Boas in a vein not dissimilar to that of Santayana declares (*Anthropology and Modern Life*, New York 1928), "I should always be more inclined to accept, in regard to fundamental human problems, the judgment of the masses rather than the judgment of the intellectuals, which is much more certain to be warped by unconscious control of traditional ideas . . . the ethical ideals of the best among the masses are human ideals, not those of a segregated class." E. F. Carritt confesses (*Journal of Philosophy*, vol. xxii, 1925, p. 577) that "the philosopher is specially tempted to warp his intuitions to his theory. Personally I know a dozen plain men and women to whom I would rather go for advice on a difficult point of personal ethics than to Kant or Hegel."

This temper reflects in the first instance a realistic sense for the contemporary scene, a sense so realistic in fact as to engender in some the fear that democracy always makes for mediocrity. Writers must have readers, and thinkers need a sympathetic milieu. But it is more than an obeisance to social facts; it represents also a curtsy to ideals. It is to the common man's presumed sense of justice, to his readiness to change if a better way can be indubitably demonstrated, to his capacity for institutionalizing and perpetuating what he does encompass - it is to these traits, the dynamic aspect, the educability of common sense, that deference is paid by critical minds. Moreover, it is an appeal with no alternative; for the intellectual and critical mind in modern times seems to have lost faith in classes that distinguish themselves in rank from common men and to have come to distrust its own class conceived as such more than it distrusts a lower level of rationality. What this attitude means for social theory appears more clearly when we see how equivocal is the appeal to common sense as a sanction or as a norm. Like the appeal to self-evidence it never arises except under circumstances that render it inconclusive; for one does not appeal to self-evident principles as long as anything else is left undisputed. Nor does one appeal to common sense except to refute those who dis-

agree with him as to either its nature or locus. What was common sense to Thomas Paine was lese majesty to George III; what was common sense to Roger Williams was sinful pride to John Cotton. The only way to make fruitful an appeal to common sense, since it is always equivocal, is apparently to educate common men to accept one's own opinions as common sense. This is not to appeal to it as a norm; it is to create it as a sanction.

Accordingly, common sense as category plays the useful social role that all equivocal terms play; they facilitate the substitution of discussion for strife through the misapprehension that all parties mean approximately the same thing. The mistake is discovered only after they do mean the same: conversion forestalls resistance. Implied in this educational technique is the primacy of interest in the life of value and the efficacy of discussion for the resolution of conflict.

Here emerges democratic theory. For the basic democratic faith is that every man is a nucleus of value. Even the commonest man has desires, interests; and if interests are values, then no man but is a locus of value. Conflict of interests demands, therefore, a method of composition that respects every interested person. Maximum value cannot be maintained by dominance, even where it is physically possible, because dominance not merely suppresses specific desires but dries up their personal fountains. If there are no values more objective than interests, then no man has a preferential rating save as he wins it. The struggle of persons for place represents the life of value; a victory represents stabilization of values; and the widest social harmony openly achieved represents the only ideal that can command full respect. No one has the luxury of absolute values and no one enjoys complete neutrality. To objectify means to socialize, and to achieve final objectivity betokens socialization to the point of universality. The greatest good of the greatest number through a process in which every person has been counted for one and nobody for more than one - this represents the final statement of democratic aspiration. At its center stands the average man with common sense describing both his achievements and his potentialities.

If the prevailing deference of intellectualism toward common sense - when it might openly, and sometimes does (e.g. Faguet, É., *Le culte de l'incompétence*, 2 vols., Paris 1910-11; tr. by B. Barstow, London 1911) reprobate it - does not

imply some such theory, it certainly does seem to imply a loss of confidence in the priority of class values, even when they are buttressed by insignia of reason. And a loss of confidence in special values means an acceptance of the more general values represented by the broader human base, unless pessimism is to be taken as a goal. Human interests once accepted as final values and dominance interdicted as method, popular education becomes the sole technique for making common sense mean good sense made common. The role of the expert in such a setting is not that of revealing new values, but of devising new techniques for fulfilling human interests and for harmonizing those that conflict. Not primarily with ends, but with means does he work. And yet as servant of the people, he may question whether presumed interests are real interests; whether egoistic interests may not with profit be sublimated rather than expressed; whether some interests are not entitled to the sacrifice of others. He may interrogate, but he may not dictate; he may lead, but he may not drive. The role of the educator is conceived not as that of indoctrinating the helpless young with all the dogmatisms of the dominant old, but as that of discovering the capacities of the young, putting at their disposal the intellectual equipment already provided, sensitizing them to whatever cultural inheritance there may be, encouraging meanwhile an independence that leads to responsibility and a sympathy that will not short circuit total power by unprevised egoism.

Common sense, in short, as a philosophic-social tool, appears as good sense only where it is either common or can be made to conduce to community. It is the norm of every other kind of sense because it is the final factual sanction; and it is the final sanction in theory as well as in democratic fact because there is no value apart from interest and no objectivity apart from social agreement. Since by hypothesis common sense represents the largest social agreement achieved at any given time, it becomes the point from which democratic education sets out to increase the area of the sharable. Common sense represents thus both the beginning and the end of the democratic vista; and democracy as process stands revealed as the self-improvement through intrinsic forces of common sense itself.

COMMUNE, MEDIAEVAL. All cities in the Middle Ages were, in the juridical sense of the word, communes. They were civil persons, recognized as such by the established authorities, and endowed with definite rights. Certain authors apply the term "commune" only to those cities which received, whether from their lord or from the king, a charter of liberties granting them more or less complete autonomy. This, however, is an abuse of language; for the grant of a charter was not indispensable to the existence of an urban commune; it merely ratified its existence.

The commune had its source in the newly created requirements of the rising class of merchants and artisans and in their need for organization to defend and promote their common interests. There were communes as early as the eleventh century, and between 1100 and 1300 they increased rapidly in number as well as in population. Communes were first established at the geographic points most favorable to commerce and industry. Here the social situation of the inhabitants differed radically from that of the rest of the population; for agriculture as a livelihood was superseded by the exchange and production of goods. Since the feudal organization, in the midst of which the communes developed, ignored the needs of the new communities, the bourgeoisie was compelled to find its own means of satisfying them.

The first of these needs was defense. Palisades or walls had to be constructed to protect the property of the citizenry against attacks by robbers. To meet the cost of such defensive works it was necessary to levy taxes upon all those who benefited by protection; and with the increase in size and complexity of the population new expenditures became necessary. Markets had to be set up, bridges, quays, halls had to be built. In order to maintain peace with-

in the fortified enclosure police measures were adopted for the regulation of the bearing of arms and for the suppression of violence.

The organization of the commune was at first purely personal. It affected only those who consented to participate in it and who bound themselves to one another by oath. At the close of the twelfth century, however, the commune became territorial rather than personal, and thereafter all inhabitants of the city and its suburbs were obliged to take the oath which placed them under the authority of the commune. If they refused they had to emigrate.

Although the communes proceeded from the initiative of the bourgeoisie their development did not go unnoticed by the established authorities. It would be quite erroneous to assume that the lords were as a general rule opposed to their development. In the majority of cases they not only did not oppose them but even favored them. In Flanders, for example, where the communes appeared earlier than anywhere else north of the Alps, the counts allowed them to develop freely, knowing that their prosperity would stimulate commerce and increase the general wealth of the country. Elsewhere, it is true, the rise of the communes sometimes provoked resistance, particularly on the part of the ecclesiastical princes. The bishops, afraid to sanction an autonomy which apparently menaced their prerogatives, spiritual and temporal, vigorously opposed the aspirations of the rising towns in Lombardy, in northern France and on the banks of the Rhine. In Milan, Cambrai, Cologne and many other episcopal cities the communes had to win their way to recognition through a vigorous struggle with their ecclesiastical lords.

In a society so divided and localized as that of the Middle Ages the form of commune naturally varied according to place and circumstance. The power of some communes extended only to the police administration and the communal finances and in no way encroached upon the superior jurisdiction of the lords, to whom they remained subject. Others succeeded in acquiring a more or less considerable share in this jurisdiction. In Flanders, for example, and in the majority of the cities of the Netherlands and of northern France, the municipal *échevins* represented both commune and prince. In Germany and Italy the urban commune became a true republic, possessing all the political and juridical rights which it had won away from its lord. As a general rule, the autonomy of the urban commune increased

as the authority of its suzerain weakened. In Germany and in Italy, where the imperial authority was declining in the thirteenth century, the "free cities" acquired an independence which made them virtually collective seignories. In England, on the contrary, the power of the crown always succeeded in holding the municipal franchises to a minimum. In France, where during the twelfth century royalty protected the communes in order to gain their support against the feudal lords, it hastened to restrict their autonomy as soon as it no longer needed their assistance.

The communes differed from one another not only in extent of power but also in their internal organizations, which ranged from the simplest to the most complex. In Italy and the south of France they were governed by consuls, in Germany by the *Rathsherren*, in northern France and in the Netherlands by *échevins* and *jurés*, in England by aldermen. Sometimes the magistrates of the city were judges and administrators as well; sometimes the judicial and the administrative powers were exercised by separate organs. Amid this variety, however, certain common characteristics may be distinguished. Everywhere the governing magistrates were grouped in councils to which members were elected either by the council, by electors following procedures which were usually very complicated, or even by lot. There was great diversity in the duration of office, which might be held for life or, as was most common, for one year.

It is in general true that the communal government, which was at first reserved for members of a plutocratic aristocracy, became more and more popular in the course of the fourteenth century. The large merchants, who at first governed the cities, were forced as a result of uprisings to share their power with the artisans and sometimes even to surrender it wholly to them. This transformation is most clearly evidenced in the industrial cities of Italy and of Belgium, where the conflicts exhibited between capital and labor were more intense than elsewhere and where the "great" (*popolo crasso*) contested with the "small" (*popolo minuto*). In Germany, however, where the cities were centers of commerce rather than of industry, the upper middle class maintained almost everywhere its privileged position.

The popular constitutions of the large communes never became permanent. The different groups of artisans who shared in the power were

almost always at strife with one another because of the divergence of their interests. In the course of the fifteenth and sixteenth centuries these recurring disturbances contributed largely to the triumph of the princes in their efforts to subject the cities to the authority of the state. Almost everywhere the sovereigns revoked the rights which the princes of the Middle Ages had conceded or which the communes had arrogated to themselves. In the national states of early modern times the communes were restricted to the domain of purely communal interests.

COMMUNE OF PARIS. The revolutionary movement known as the Commune of Paris of 1871 is significant primarily as constituting the most clearly defined attempt of the Parisian proletariat to free itself from hostile domination by rural France. Since the days of the commune of 1793 there had been in Paris a strong proletariat, inarticulate at times but always a potential revolutionary force. On a number of occasions, as in 1830 and 1848, it had attempted to exert its strength, only to be frustrated in the end by the overwhelming majority of rural representatives in the National Assembly. Revolutionary leaders of the type of Auguste Blanqui (*q.v.*), aware that their greatest strength lay in this urban proletariat, denounced the rural classes and openly advocated the "Parisification of France." The alignment of urban versus rural is strikingly indicated by the plebiscite of May, 1870, in which the vast majority of French voters recorded their approbation of Napoleon III's liberal reforms during the preceding decade, while the minority vote of repudiation was drawn almost entirely from Paris, Lyons, Marseille and a few other industrial centers.

The political situation resulting from the defeat of Napoleon III at Sedan on September 2, 1870, intensified the latent hostility between

Paris and rural France. On September 4 a republic was proclaimed and the Government of National Defense set up. Two weeks later the German army laid siege to Paris. Alarmed by the seriousness of the military crisis at hand Paris accepted, although with some misgiving, the new republican leaders. But as the siege continued month after month with no sign of the promised *sortie torrentielle*, the Parisian proletariat, suffering from hunger and cold, became increasingly impatient and reviving with favor the tradition of the commune of 1793 advocated the *levée en masse* under the dictatorship of Paris. As early as September a demand for the creation of an autonomous commune had been presented to the new government. Unofficial machinery for carrying on municipal activity was being developed in the city, with the Comité Central des Vingt Arrondissements as the principal coordinating agent between the various administrative units. The power of the Parisian proletariat had been strengthened by the increase in the national guard necessitated by the war. The new battalions had been drawn from the laboring classes and had been granted the privilege of nominating their own officers, most of whom shared with the men a strong desire for an autonomous commune. In February, 1871, these proletarian battalions, joining in a loose federation (thus acquiring the name *fédérés*), formed a Comité Central de la Garde Nationale, with three representatives from each of the twenty arrondissements. Thus, by means of the two *comités centraux* as well as by several other smaller organizations of a similar nature there were being created the beginnings of a coordinated political activity similar to that which had culminated in the commune of 1793. The ultimate goal of this activity is clearly indicated in an *affiche* issued by the Comité Central des Vingt Arrondissements on January 6, 1871, after almost four desperate months of siege: "The municipality or the Commune—whichever name may be preferred—is the only salvation of the people, the only recourse against extermination." Realizing that the interests of the Paris proletariat could be protected more effectively by the strong military committee of the National Guard, which was warmly supported by revolutionists like the Blanquists as well as by the more peaceful socialists of internationalist tendencies, the Comité Central des Vingt Arrondissements withdrew to a position of comparative obscurity.

On January 28 an armistice was signed between the German army and the Government of

National Defense in order to give France an opportunity of electing a National Assembly which should decide between peace and a further continuation of the war. This assembly, reflecting the reactionary and pacifist sentiments of rural France, immediately antagonized the fervid patriotic spirit of Paris by an ignominious capitulation to the terms dictated by Bismarck. Moreover, motivated by a deep distrust of the revolutionary tendencies of Paris the "assembly of rurals" passed a series of measures injurious to the interests of the city and as a final insult voted to transfer the capital of France to Versailles. Thiers, the head of the new government and an implacable enemy of Paris, realizing the danger inherent in the national guard committee, determined, as a crippling blow to the Parisian movement for autonomy, to deprive this committee of its military strength by capturing the cannon which it had jealously guarded. The attempt on the morning of March 18 to surprise the Parisian troops and transfer the cannon from the heights of Montmartre to the headquarters of the government forces was frustrated by a comparatively feeble opposition and by the defection of many of the supposedly loyal battalions entrusted with the mission. The clash soon assumed, owing chiefly to the hysteria aroused in the mob which had assembled, the proportions of a revolutionary movement, in the first stages of which the leaders of the government forces were executed. Thrown into a panic by the apparent strength of the Paris troops, Thiers fled to Versailles, taking with him the battalions which still remained loyal and the remnants of the centralized governmental machinery and authority which had so often in the past proved inimical to the interests of the city of Paris.

Bewildered by the unexpected situation of finding itself the sole body left in Paris with any semblance of real authority and failing to receive any constructive cooperation from the mayors of the various arrondissements, the Comité Central de la Garde Nationale after a week of confused activity called for the election of representatives to an independent commune of Paris. Over two hundred thousand citizens voted, returning 90 delegates, 25 of whom were laborers, 12 professional men and the remainder representatives of the lower middle classes. The national guard committee, having served its function as a transition government, announced its retirement from political activity. Paris was at last in a position to legislate in its own interests through

representatives untrammelled by a hostile majority of rurals. "By right of her autonomy," reads the Manifesto of the Commune of Paris of April 19, "and profiting by her liberty of action, Paris reserves it to herself to operate, according to her own ideas those administrative and economic reforms that are demanded by her population . . . and to universalize authority and property according to the necessities of the moment."

That the Commune of Paris was so short lived and that it failed so conspicuously to "operate" these "administrative and economic reforms" is attributable in the main to an absence of leaders capable of integrating the various incongruous elements or of formulating a constructive program. The bulk of the delegates, men of the type of Delescluze and Pyat, were essentially demagogues, would-be Jacobins, repeating the inflated but empty phrases emanating from the radical clubs of Paris. Ignorant of contemporary economic problems they lived in a glory borrowed from the past, indulging endlessly in remote analogies to the heroic figures of the first commune in 1793. Although they confined themselves in their official manifesto to a program of decentralization with a loose federation of independent autonomous communes, they in reality foresaw, in view of the obvious political incapacity of rural communities, the quick breakdown of such a system and the substitution of a strong centralized system under the hegemony of Paris, which would thus assume the power hitherto exercised by the hostile National Assembly. As legislators they contented themselves with broad gestures, with various measures—such as separation of church and state, suppression of the budget of cults, nationalization of mortmain lands, abolition of conscription and the standing army—which they lacked the authority or the power to enforce but which seemed to imply a prerogative of legislation on a national scale.

The incapacity of the neo-Jacobins for the details of practical administration was soon revealed by the breakdown of the commission form of government which they attempted to inaugurate. Within a short time the executive commission was replaced by a commission composed of one representative from each of the other nine commissions. This proving equally ineffective, the communards, in futile imitation of their prototypes of 1793, revived the Committee of Public Safety, which placed final power in the hands of five men. A second such com-

mittee immediately replaced the first, without, however, remedying the growing disorder. The Comité Central de la Garde Nationale, wearied with the blunderings of the commune's committee on military affairs and irritated at the failure of the majority to take the lead in transforming the insurrection into a social revolution, once more assumed an active political role and by its interference and by its incendiary manifestoes to the working classes of Paris added still further confusion. The military situation, growing more critical as a result of the advances of the Versailles troops, absorbed the attention of the commune to the almost complete exclusion of the "administrative and economic efforts" which it had in the beginning vaguely contemplated.

A very small group, typified by such delegates as Rigault, the student, and Ferré, the apothecary, was composed of professional revolutionists, followers of Auguste Blanqui. Indifferent to the subtleties of social and economic doctrine, demanding of his followers only courage and an aggressive loyalty to the revolutionary proletarian movement, Blanqui had developed during the years from 1866 to 1870 an intelligent and well disciplined party of revolt consisting for the most part of students and journalists. The abortive insurrections of the Paris proletariat in August, September and October, 1870, and in January, 1871, had been ably forwarded by Blanqui and his followers. Sharing with the majority Jacobins a strong patriotic sense, a veneration for the heroes of 1793 and an extreme hostility to rural France the Blanquists in addition championed a program of violent class struggle, which has been misrepresented by hostile critics as a characteristic of the commune as a whole.

In striking contrast to the Jacobin majority and the Blanquists was an inconspicuous group of seventeen socialists, men of the type of Varlin, the bookbinder, Malon, the painter, and Theisz, the carpenter, recruited almost entirely from the actual working classes and closely affiliated with the Paris Federal Council of the International Workingmen's Association. Peaceful organizers rather than agitators, internationalists rather than patriots, they looked forward to an eventual socialization of society rather than backward to the violent, bourgeois commune of 1793. Their deep Proudhonism had within recent years been tinged, and to some extent confused, by the doctrines of Marx and the influence of the First International. They alone in the commune were

sincere federalists, seeing in the autonomous commune the first step toward social equality and an ideal agent for the socialization of land and tools. They alone had an appreciation of economic forces and problems and a sense, however embryonic, of an economic program. Their measures, such as the exploitation of deserted factories in the interests of the workers, the granting to workingmen's associations the monopoly of supplying army uniforms and ammunition, the abolition of night work for bakers as well as of seizure of fines and stoppage on wages, although insignificant in themselves represent practically the only attempt at specific legislation designed to improve the condition of the working classes and are of particular interest as indicating the socializing program that the commune, had it not been so quickly suppressed, might have pursued. The authoritarian views of the Jacobin majority were completely alien to the socialistic ideals of this group and the first Committee of Public Safety met with strong opposition. Here again, however, the lack of capable leadership—and in addition a certain confusion of ideology—defeated a consistent policy. Succumbing to the spirit of panic which pervaded the commune during the final weeks of its existence the socialists vacillated and condoned the second Committee of Public Safety.

The Versailles troops, which on May 21, 1871, entered Paris and on May 28, after seven days of most bitter street fighting, finally overcame the desperate resistance of the communards, were little disposed to make any distinction between these various groups which had constituted the refractory commune. Retribution was relentless, impartial; enraged by the commune's burning of buildings and killing of hostages the military forces of the government set out upon a campaign of execution that for its severity has seldom been equaled. Between twenty and thirty thousand citizens of Paris were executed. Blinded by the animosities and loyalties engendered by these final hysterical days of defense and retribution, historians of the commune have likewise tended to lose sight of the heterogeneous and contradictory elements constituting the actual commune. Whether conservative or sympathetic, these historians have been inclined to select some single element, or at most a few elements, to which they have given the name "Commune of Paris." This tendency to ignore the actual complexities of the commune in the effort to draw from its events a simplified conclusion is most strikingly revealed in the utter-

ances of later revolutionary labor leaders and organizations. Reading back into the activities of the commune a considerable amount of subsequently evolved ideology and methodology they have exaggerated the importance of that very small minority composed of Blanquists and Internationalists. The tradition of the heroism of the Paris proletariat and of the brutal retribution of the national government has been sedulously kept alive in the minds of socialist and communist parties, which still celebrate either the 18th of March or the "Bloody Week." Thus there grew up around the commune an aura of sentiment and emotionalized generalization which has only recently begun to be dispelled by a more critical analysis. But the proletarian mysticism as well as the anticommunist prejudice bids fair to remain untouched by all types of scientific demonstration.

COMMUNICABLE DISEASES, CONTROL OF.

OF. In the history of man's conflict with his environment there is no more dramatic chapter than that which deals with the progressive conquest of disease. Cholera, endemic in the Far East, has again and again struck terror to the capitals of Europe. Yellow fever from its home in Central America has spread time and again to nearly every seaport in the United States. Bubonic plague has twice ravaged the whole known world, and influenza in its deadliest form has girdled the globe a dozen times.

In war and in peace the destinies of nations have been changed by plague and pestilence. Typhus fever was the worst of the terrors which beset the armies of Napoleon during the retreat from Moscow. Canada would probably now be a part of the United States if the force of Montgomery and Arnold had not been wrecked by smallpox and dysentery. Of the one hundred and two Pilgrims who landed at Plymouth on December 21, 1620, forty-four had succumbed to epidemic disease by 1621. Newman brings out the broad social implications of such tragedies in the following paragraph: "Petrarch, who witnessed the Black Death in Italy, foresaw our incredulity of the terrible condition of things—empty houses, abandoned towns, squalid country, heaps of dead, a vast and devastating solitude over the world. Remotely, the plague altered the economics of the people, for in addition to depopulation, it paralyzed all trade and industry; it mobilized the laborers and dispersed industries, redistributing poverty and wealth; it initiated a new system of farming; it left its mark on wages, on rents and taxes, and on the tenure of the land; it stripped the old governing classes of their authority, and the municipalities and guilds of their privileges and status; and it brought demoralization in its train" (p. 142).

In the history of preventive medicine there have been three major theories as to the causation of epidemic disease. The inclination of primitive mankind was to ascribe epidemic disease to the influence of malign spirits. If disease was due to the power of demons the technique of preventive medicine was clearly indicated. It was essential either to propitiate the malign spirits by tribute and sacrifice, to drive them away by repellent or magic substances or to invoke the overruling influence of still higher spiritual personalities. Thus the Tunguses and Burjats placed before their huts milk, tea and meat, begging the spirit of smallpox for this service to spare the inmates; and the natives of the Andaman Islands set up in their villages poles smeared with black beeswax, the odor of which was supposed to be distasteful to the demon. Long after the more naïve forms of the demonic theory had been abandoned its vestiges survived in the practices of the leaders of science. For protection against malaria Pliny recommended either the dust in which a hawk has rolled, placed in a bag tied with red thread and worn about the neck, or the largest tooth of a black dog or a certain kind of wasp which flies alone and must be caught with the left hand. All

Commune of Paris — Communicable Diseases, Control of 67

through the Middle Ages magic of this kind was inextricably mingled with the elements of growing scientific knowledge. In religious circles the concepts of exorcism continued to be powerful; there were solemn processions to drive away the plague and votive churches were built to commemorate its cessation. In 1918 during the influenza epidemic in the United States the stock of camphor in the drug stores was almost exhausted, so general was the belief that a bag of camphor hung around the neck would ward off the disease. Charms and amulets are still used widely.

It is to the Greeks that we owe the first break from this primary demonic theory of disease. They conceived the universe as a universe of natural laws, and although their actual explanations of phenomena were often almost as unsound as the anthropomorphic theories they replaced they were at least naturalistic theories, assuming causation. They could therefore be corrected by study and experimentation, while ant iropomorphism left its votaries helpless before the essentially unpredictable. Hippocrates believed that epidemic diseases were caused by a corruption of the atmosphere associated with the exhalations from marshes or with malign influences of the stars, and he attempted to combat such influences by building great wood fires in infected areas and feeding them with fragrant wreaths, flowers and perfumed ointments. This was the basis of the second great theory of disease, the miasmatic theory, which has profoundly influenced medical thought down to comparatively recent times. When Paris was ravaged by the plague in 1348 the medical faculty reported that an evil conjunction of the planets had occurred over the Indian Ocean, raising up corrupt vapors from earth and water, and that these vapors, borne to Paris by "heavy and turbid southern winds" were the immediate cause of the epidemic. Sydenham in the seventeenth century attributed epidemic diseases to "a secret and inexplicable alteration of the air, infecting men's bodies."

Even in antiquity, however, the communicability of plague was recognized by Thucydides. The Hebrew scriptures taught the concept of contagion and the mediaeval church practised its corollary, isolation, beginning with the campaign launched against leprosy at the Council of Lyons in 583. During succeeding centuries this campaign, which included strict quarantine regulations and the segregation of patients in isolation camps or leprosaria, was apparent-ly

successful and the disease had practically disappeared from northern Europe by the sixteenth century. Meanwhile the principle of quarantine was applied to the control of plague, though with less tangible results. In 1374 Venice denied entrance of infected ships, travelers or freight to the city and port; in 1383 Marseille erected its first quarantine station, at which, after rigid inspection of the vessels, all travelers from suspected ships were detained for forty days and cargoes, ships and rigging exposed to elaborate processes of disinfection and to the influence of air and sun. The methods used were crude and imperfect and at the same time cruel and oppressive.

The leaders of medical thought consistently resisted the idea of contagion, yielding only step by step, first in the case of diseases like smallpox and leprosy, and maintaining a miasmatic theory of cholera and typhoid fever up to half a century ago. This was because the theory of contagion, as it was held up to 1880, did not and could not explain all the facts with which physicians were familiar. In diseases like plague and cholera and typhoid fever they knew that direct exposure to person-to-person contact often failed to produce infection while cases frequently arose without such contact. Until a more plausible theory of contagion could be formulated they were scientific in maintaining that something like the miasmatic theory of Hippocrates was the best explanation of the facts. Furthermore, while the practise of isolation, based on a theory of contagion, had achieved successes in dealing with smallpox and leprosy, the miasmatic doctrine also had victories to its credit. In its final form, as applied to cholera and typhoid fever, it assumed that miasms of disease were generated by decomposing filth, particularly excretal filth, and this concept led to the work of the British sanitarians, Chadwick and Simon, who brought about the "great sanitary awakening" in the middle of the nineteenth century. They were wrong in thinking that excretal filth did its work by generating miasms but they were right in thinking that filth was related to disease, and when they cleaned up the British cities and introduced good water supplies and sewerage systems they achieved substantial results in the decrease of cholera and typhoid fever.

It was in the midst of these limited but real successes of a largely empirical sanitation that the basic scientific discoveries were made which at last cleared up the mystery of communicable disease and laid a firm basis for its control.

The first steps were taken in a field apparently very remote from that of medicine. Pasteur, then a young chemist, was studying the relation between crystalline form and chemical composition in the asymmetrical tartrates. He became interested in the process of fermentation because tartrates were found in fermenting liquids. Their presence led him to doubt the current theory of fermentation which attributed this process solely to the oxygen of the air. He ultimately proved that the microbes which his microscope demonstrated in decomposing materials were not mere accidents in the process but its causative agents, and established the germ theory of fermentation. Lister in Scotland perceived the analogy between fermentation and the suppuration of wounds, and through the aseptic technique which developed from his researches the operating room and the maternity ward were changed from charnel houses to laboratories.

But no one had perceived the more remote analogy between fermentation and the spread of communicable disease. In 1865, when Pasteur's studies on fermentation had already conferred great practical benefits upon the beer and wine makers of France, he was called upon for aid in connection with a new industrial problem. In the silk producing districts of the south the local industry was threatened with ruin because the silkworms were dying. The microscope soon revealed the fact that the bodies of the sick worms were crowded with microbes like those previously observed in fermenting liquids. It was two years before Pasteur concluded that the cause of the phenomenon was the same in the two instances. By 1870, however, his case was complete. The silk industry was saved and the germ theory of communicable disease was established.

The progress of the new knowledge was now rapid. In 1876 Robert Koch for the first time brought forward conclusive proof that a disease of man and the higher animals—in this case anthrax, or splenic fever—was due to a living microbe. In 1882 he announced the discovery of the germ of tuberculosis. The improvements in the technique of staining and photographing bacteria for identification and comparison and the methods of obtaining pure cultures of organisms introduced by him and by his colleagues in Germany made bacteriology a simple and reasonably exact science, the application of which between 1880 and 1890 led to the isolation of the causative agents of many diseases. In 1892 Hermann Biggs in New York translated

the new science into terms of administrative procedure and made the bacteriological laboratory the fundamental basis of the modern public health program.

The establishment of the germ theory made it possible to close the long conflict between contagionists and anticontagionists. The elements of contagion are now no longer vague emanations about which one must reason in the abstract, but living cells of plant or animal nature which one can see under the microscope and cultivate in test tubes in the laboratory. They are parasites which have become adapted to life in the tissues or on the warm moist inner surfaces of the human or animal body. Hence they must always originate in such bodies and not in a non-living environment such as night air or decaying vegetation. Human beings must be looked to as the ultimate sources of infection, and the development of bacteriological methods has made it possible to determine which individuals are infected and in which bodily discharges the germs are likely to pass out of the body.

Bacteriological technique has made possible the discovery that it is not merely the sick who may harbor the germs of disease. Individuals who are themselves able to resist the attacks of a particular germ may cultivate that germ in nose or throat or gall bladder and discharge virulent organisms for periods of months or years. The demonstration of the existence of such human "carriers" removed the last obstacle to the acceptance of the communicability of epidemic disease, for it explained the fact that such diseases do frequently occur without exposure to a recognizable previous case.

Laboratory studies indicate that the disease germ very rarely thrives in nature outside of its normal habitat. In water or earth or on dry surfaces it dies out rather quickly. The discovery of the rapid destruction of disease germs outside the body has made it clear that many of the dangers which were once feared are illusory. Fomites (clothing, books, toys or other objects handled by a sick person) will be dangerous only if exposure has been recent. Dust contains very few disease germs. The danger from the fresh sputum of a consumptive transferred to the mouth by flies, food, fingers or some other agency is enormously greater than the danger from such sputum dried and blown about in the form of dust.

The most important way in which the spread of infection takes place is by contact—the more

or less direct transfer of discharges by mouth spray, by the hands or by objects which have been recently mouthed or handled. It is in this way that those diseases are spread in which the infectious organism is present in the discharges of the nose and throat. A second common type of infection is through the agency of certain articles of food and drink, such as water, milk, shellfish and uncooked foods, which have been handled by a carrier. It is in this way that the intestinal diseases cholera and typhoid fever are commonly spread. Diseases of the respiratory tract, such as diphtheria, scarlet fever and septic sore throat, may also be transmitted by milk and foods. Finally, in certain diseases like malaria, yellow fever, bubonic plague and typhus fever the germ does not leave the body in any of its normal discharges. It is present in the blood and is transmitted from person to person by the agency of biting insects; as a rule only one kind of insect spreads a particular disease.

These are the bases of the modern conception of the etiology of communicable disease. In the popular mind, however, and in the practises of the more conservative health departments there is still an overemphasis on the control of nuisances and a fear of bad smells and leaky plumbing which hark back directly to the older miasmatic theory of disease, and fumigation is often practised rather from Hippocratic tradition than from any real efficacy which it possesses in the destruction of disease germs.

The first essential in the control of communicable diseases is the proper disposal of those body discharges which contain the specific parasites. Particularly in dealing with the intestinal diseases typhoid and paratyphoid fever, cholera, dysentery, hookworm disease and the numerous intestinal infections of the tropics the proper disposition of intestinal and urinary discharges is of primary importance. This group of diseases, common in London and New York in the middle of the nineteenth century and devastating even today in many rural districts, has been almost banished from northern cities by the introduction of modern plumbing and sewerage systems.

Of this group of diseases hookworm infection is the outstanding example. The sufferings of the northern soldiers in Libby Prison during the Civil War were due to this unsuspected cause. Out of a total of some seventeen hundred million people inhabiting our globe it is estimated that over nine hundred million still live in countries where hookworm disease is a more or less serious

menace. The inertia of the populations in many tropical lands is due chiefly to chronic infection with this parasite. By treatment with certain specific drugs it is possible to destroy the worms in the intestine and effect an individual cure. The fundamental control of this disease depends, however, on proper care of excreta. In such regions as our southern states this requires the prevention of promiscuous soil pollution by the introduction of tight outdoor closets screened to prevent access of flies or by the construction of a sewerage system. In China the excreta used for fertilization of crops should be treated in such a way as to destroy the eggs of young worms. By demonstrations carried out in fifty different states and countries it has been shown that hookworm disease may be controlled with striking success by the application of such methods. Thus in Richmond county, Virginia, the proportion of school children infected with hookworm, which was 83 percent in 1910, was reduced by soil sanitation to 35 percent in 1911 and to slightly over 2 percent in 1921.

It has already been noted that the germs of the intestinal diseases are very commonly disseminated on a large scale by articles of food and drink. A second essential of sanitation is therefore the protection of such articles. The discharge of sewage into water supplies is one of the most obvious dangers, and epidemics of cholera in Europe throughout the Middle Ages were no doubt frequently due to this cause. In the United States the first outbreak clearly traced to water supply occurred at Plymouth, Pennsylvania, in 1885, when over 1100 cases of typhoid fever developed in a town of 8000 people because the discharges of a single typhoid patient had been washed into the reservoir. Similar epidemics at Lowell and Lawrence, Massachusetts, in 1890-91, at New Haven, Connecticut, in 1901 and in hundreds of other cities throughout the country gradually taught the lesson that no untreated surface water is ever a safe source of supply.

The development of bacteriology made it easy to devise methods of eliminating such dangers. There are today four general methods of purification: storage, slow sand filtration, rapid filtration with the use of chemicals, and disinfection (usually with chlorine). By these methods, used alone or in combination, even polluted water may be made safe and potable. It was largely as a result of such purification of water supplies that the typhoid death rate of the United States Registration Area dropped from

over 46 per 100,000 in 1890 to less than 8 per 100,000 in 1920.

Next to water milk is the food which has played the largest part in the causation of epidemic disease. Germs of tuberculosis from the cow have been spread by this medium and have caused in children tuberculosis of the glands, joints and spine. Germs of typhoid fever, diphtheria, scarlet fever and septic sore throat from human cases and carriers have been transmitted to thousands, while tens of thousands of young infants have died of "summer diarrhea" as a result of germ laden milk. Tuberculin testing of cattle is useful for the protection of dairy hands from this disease. Clean dairying is imperative and certified milk helps to raise general standards of dairy cleanliness. The only kind of milk, however, which is really safe is that which has been made safe by heating. Pediatricians now give only boiled milk to infants. Public health experts recommend only pasteurized milk for adults. The latter process, by which milk is heated to 140°-145° F. for thirty minutes, destroys all disease germs without injuring any of the important nutritive qualities of the milk—an illustration of the sanitary value of cookery.

Insects may transmit disease in two quite distinct ways. The common house fly may carry the germs of typhoid fever from a privy vault to a breakfast table—a purely accidental and mechanical type of transmission. Or germs present in the blood may be sucked out by a biting insect and transmitted to a new victim in a subsequent bite. In many diseases the germ is a protozoon parasite and passes through certain stages of its life history in the body of the insect, so that its relation to the insect carrier is a specific and essential one. Malaria is an excellent example of this latter class. Up to the end of the last century it seemed a perfect type of miasmatic disease. Its very name implied that it was due to bad air. It was known to be associated with marshes and night air and the digging up of the soil. In 1897, however, Ronald Ross in India demonstrated the transmission of bird malaria by a mosquito, and in the next year Grassi and Bignami in Italy established the participation of the insect in the transmission of human malaria. The concept of a corrupted atmosphere generated by warm, moist soils gave place to the concept of a mosquito carrier bred in stagnant water. Through drainage of swamps, destruction of mosquito larvae by oil or poison sprays, screening of dwellings and treatment with quinine (a

specific poison for the malaria germ in the blood) its control in most localities may be made readily effective. Recently wooded swampy areas have been sprayed from an airplane with a poison electrically charged so that it will be repelled by the leaves of the trees and will pass down through them to the larvae in the water below.

Even more dramatic is the story of the conquest of yellow fever. This disease ruled the islands of the Caribbean and the Isthmus of Panama and permeated as far as the northern borders of the United States. In 1793 a tenth of the population of Philadelphia is said to have perished from its ravages, and between 1800 and 1879, with but two exceptions, it visited this country every year. In 1900 a group of American army surgeons, Reed, Carroll, Lazear and Agramonte, discovered the mosquito carrier by a series of studies carried out in Cuba. Carroll and Lazear both acquired yellow fever and Lazear died of it. But the experiments continued and by the end of the year the mosquito carrier was identified. In 1901 the scourge was wiped out in Havana by practical mosquito control, and Gorgas, who had been in charge of the work in Cuba, went to the isthmus and made possible the construction of the Panama Canal by the application of this knowledge. A world wide campaign for the eradication of yellow fever has been undertaken, until today it exists only in certain areas of Brazil and in its place of origin, the Gold Coast region of West Africa. The problems of practical control in these last strongholds are more difficult than in Central America and much research will be needed for complete victory. Between 1927 and 1929 four investigators, Noguchi, Stokes, Young and Wake-man, lost their lives on the Gold Coast in this research.

Only brief mention can be made of the two deadliest pestilences of mediaeval times, typhus fever and bubonic plague—both insect borne and both now controllable. Typhus fever, the "ship fever," "camp fever" and "jail fever" of former days, the scourge of armies throughout the ages, is carried by body lice and can be eliminated by habits of personal cleanliness. Bathing and disinfection of clothing held it in check during the Great War except on the southeastern front, but the conditions accompanying the breakdown of the Russian Empire caused a widespread epidemic, against which western Europe was successfully defended by the cordon established at the Polish border with the aid of the

League of Nations. Bubonic plague, the "Black Death" of the Middle Ages, is primarily a disease of rodents—rats, marmots and ground squirrels—transmitted to man by the bite of the flea. In the sixth century and again in the eleventh and succeeding centuries (particularly the fourteenth and seventeenth) it spread devastation over the known world, but when a third pandemic broke out in 1894 the resources of modern bacteriology were ready to check it. Except in India, where ten millions have perished from the disease and where it still prevails, the plague has been held under control. It cannot be eradicated so long as the wild rodents in Siberia, in the Volga region, in South Africa and in California form a reservoir of infection. It can, however, be prevented from assuming epidemic form by the control of rat breeding and rat harborage in the vicinity of human dwellings.

The third great group of diseases, those which spread chiefly by more or less direct contact between one human being and another, are more difficult to control than either of the two groups hitherto discussed.

The first step in attempting to prevent the spread of these diseases is their prompt recognition. This is often a difficult task because many diseases, such as measles and whooping cough, are most contagious when their clinical symptoms are not clear enough to make a definite diagnosis possible. The germ of measles, for example, is most abundant in the nose and throat discharges when the symptoms are those of an ordinary cold and before the rash appears. In some diseases, such as diphtheria and cerebrospinal meningitis, bacteriological tests make an early diagnosis possible. In others the germ is still unknown or cannot be identified by simple laboratory procedure.

Once the disease is recognized, by laboratory test or by diagnostic signs such as the character of the rash, the case should be isolated. By isolation is meant "the separating of persons suffering from a communicable disease, or carriers of the infecting organism, from other persons, in such places and under such conditions as will prevent the direct or indirect conveyance of the infectious agent to susceptible persons." Methods of isolation differ widely in different diseases. In some, like hookworm disease, no isolation is necessary provided that ordinary methods of excretal disposal are in force; in insect borne diseases the only precaution needed is exclusion of the insect carrier. In common diseases of children, like German measles and

whooping cough, separation from susceptible children and exclusion from school and places of public assembly is all that is usually attempted. In such diseases as diphtheria absolute room isolation is enforced. In all cases the most important element in isolation is the immediate disinfection of bodily discharges and of objects soiled by them during the course of the disease. Isolation must continue until all active symptoms have ceased and all open lesions healed. In certain diseases the termination of isolation can be fixed by bacteriological tests. In other diseases an arbitrary time limit, based on experience, is set. When the isolation period is over the sickroom is thoroughly cleaned and aired but fumigation is advisable only in the case of insect borne diseases. Concurrent disinfection of discharges during the course of the malady is the one essential. If this has been carried out the sickroom will not be infected; if it has not it is reasonably certain that other members of the household will already have been exposed.

Even more important from a practical standpoint than the control of the actual case is the supervision of "contacts," persons presumably exposed to infection from the case itself. Although the primary case often cannot be detected in time to prevent exposure of others, a third crop of cases can be avoided if the contacts are effectively supervised. In diphtheria, meningitis and some other diseases carriers can be detected by bacteriological tests and treated just as established cases would be. In other diseases the contacts are placed in quarantine, by which is meant "the limitation of freedom of movement of persons or animals who have been exposed to communicable diseases for a period of time equal to the longest usual incubation period of the disease to which they have been exposed." As in the case of isolation, the rigidity of quarantine varies with the disease. Moderate regulations generally enforced are far more effective than unduly severe ones which are unenforceable.

Knowledge of the real facts underlying the spread of disease germs has made methods of control not only more effective but also far less irksome. A ship from a cholera infected port need no longer be held for forty days. A two-day period suffices for bacteriological examination of the stools of all on board to determine which, if any, are carriers of the cholera *vibrio*; and all but those actually infected can be released promptly. The shadows of past superstition are by no means wholly dispelled, particularly in

the case of leprosy, but on the whole maritime quarantine can now be a precise and at the same time a humane and simple procedure.

The efficacy of measures of isolation and quarantine varies widely with different diseases, according to the case with which cases and carriers may be recognized, but even when many light cases are missed (as occurs with scarlet fever) it is believed that the isolation of the more severe cases may lead by selection to the evolution of a milder type of disease. A most important factor in the control of communicable diseases of all kinds is the development of a "sanitary conscience," which realizes the danger of exposing others to communicable disease of even the mildest type (such as what may appear to be only a common cold), and of the "aseptic sense," which keeps everything unclean away from the mouth and nose. Fingers are the chief means of exposure to communicable disease.

Isolation and quarantine aid materially in the control of communicable disease, but in view of the frequency of "missed cases" and undetected carriers their results fall far short of completeness. Fortunately, there exists in many diseases a second line of defense which is far more effective: the creation of a state of artificial immunity in the person who has been or may be exposed to the disease in question.

It had long been an axiom of medicine that an actual attack of a communicable disease conferred more or less complete immunity against subsequent attacks. In the case of smallpox a method of producing such immunity at will had been practised for centuries in the East in the form of variolation, or direct inoculation of the disease under especially controlled conditions. The practise was introduced into Europe and America in the early eighteenth century, but through the discovery of Jenner in 1796 was superseded by vaccination, or inoculation of the smallpox of the cow. Pasteur generalized the principle of producing immunity through inoculation by his studies on chicken cholera and anthrax. In May, 1881, he demonstrated conclusively a method of vaccination against the latter disease and established the general principle that vaccines can be prepared from weakened or killed germs which will no longer cause a true attack of disease but which will stimulate the defensive mechanism of the body just as an attack of disease would do, producing immunity against subsequent infection. Four years later Pasteur himself prepared a successful vaccine against rabies, and before the end of the

nineteenth century vaccines against cholera, typhoid, plague and many other communicable diseases were in use.

The immunity produced by a vaccine is "active" immunity; that is, it depends on the response of the vaccinated individual to the microbial products introduced. Such immunity is of varying duration, lasting usually for months and sometimes for life, and the vaccine is usually administered to a healthy person to protect him against possible future exposure. Due to the work of Behring and Kitasato and Roux, carried out in the last decade of the nineteenth century, there is still another general method of protection. It rests on the production of "passive" immunity by the injection into the individual of blood serum from another individual or from an animal which has been previously rendered actively immune by vaccination or by an actual attack of disease. Thus in diphtheria a horse is vaccinated with the toxin of the diphtheria germ so as to produce in its tissues a high degree of active immunity. The blood of this horse, containing the antitoxin it has formed, is then drawn off and purified and the antitoxin is used for producing passive immunity in the human being. Passive immunity is temporary and immune sera are generally used for the treatment of an infection in actual process, but they may also be employed for the protection of exposed persons in a temporary emergency. For example, young babies exposed to measles are often protected by an injection of serum from a convalescent case.

Diphtheria is a disease in which the armamentarium of medicine is unusually complete. The infected individual and the carrier can be detected by bacteriological examination. The Schick test discovers whether active immunity already exists. A case can be treated or temporary passive immunity produced by the use of antitoxin and a lasting active immunity created by inoculation with toxin-antitoxin, or toxoid, which are really vaccines. The complete eradication of this disease, like that of smallpox and typhoid, depends on the application of simple immunological methods which are already at our disposal. The problem of control is no longer medical but social, psychological and educational.

Quite separate and distinct from these types of specific immunity is another sort of bodily defense against disease, which is called general vital resistance. In some infections this is of no importance. Everyone who is exposed to measles

or smallpox and is not immune as a result of a previous attack or of vaccine or serum treatment will contract the disease, although possibly in a very mild form. In other infections the effects are quite different. In tuberculosis and pneumonia, for example, even the body which does not enjoy specific immunity may hold the invading germ in check without any symptom of clinical disease. The exact meaning of vital resistance is not fully understood, but ways to promote it are known. It is known that food, sufficient fresh air, exercise and rest and the avoidance of poisons are generally required to enable the individual to resist or to conquer tuberculosis, and the promotion of habits of healthy living is the chief weapon against this disease. Its control depends not merely on diagnosis and the provision of good hygienic conditions for the infected individual in a sanitarium; it involves the promotion of vital resistance in the population as a whole by all measures which tend to elevate standards of living. The construction of roads and railways, the development of food supplies, the introduction of new methods in industry which eliminate health hazards and increase wages, improvements in government—all these and many more elements enter into this fundamental problem.

In the interaction of the four factors discussed—disease germs, agencies for their transmission, specific immunity and vital resistance—is to be found a complete explanation of the natural history of communicable disease. Aggregation in large communities and ease of communication facilitate infection but, if sanitary precautions are adequate, they also facilitate the acquisition of active immunity on the part of those individuals who receive slight infection. It has been discovered by serological tests that in such a community a large proportion of children actually acquire specific immunity against diphtheria, scarlet fever and tuberculosis without suffering from a recognizable attack of disease.

The variations of communicable disease in relation to climate and season are also easily explicable on the basis of the four factors noted. Insect borne diseases are confined to the climatic regions and seasons to which their secondary hosts are adapted. Mosquito borne infections are diseases of the tropics and the summer season, while typhus fever is characteristic of a warm but not a hot climate. For physiological reasons which are beginning to be understood the intestinal tract is least able to resist invasion in a warm climate or season, while the reverse is

true for the upper respiratory tract. Hence intestinal diseases prevail in summer, respiratory diseases in winter.

The uneven distribution of disease in various social classes is largely a problem of general vital resistance, and such phenomena as the tremendous increase of tuberculosis in central Europe at the end of the war demonstrate how potent a factor limitation of the food supply may be. Even epidemics of typhus fever have a social and economic basis under conditions such as those which in Russia in 1921 made hot water and soap luxuries quite beyond the reach of the masses of the people. The control of communicable disease is far more than a medical problem; it involves nearly everything which affects the well-being and intelligence of a people.

A picture of the present status of communicable disease control will be more easily formed by a summary in tabular form of certain essentials for the chief communicable diseases of the United States. The data are taken from the report of the American Public Health Association on *The Control of Communicable Diseases* (rev. ed. New York 1927), but all minor details, such as incubation and isolation periods, have been omitted.

Forty diseases are listed in the table, including all the well defined communicable diseases which may occur in temperate climates. The large number of purely tropical infections are omitted. In thirty of these diseases the causative germ has been identified; the exceptions are chicken pox, dengue, encephalitis, German measles, influenza, measles, mumps, rabies, smallpox and trachoma. Of these chicken pox, German measles and mumps are not of great importance, while for dengue, measles, rabies and smallpox effective methods of control are known in spite of the fact that the germ is unknown. Encephalitis and influenza are the outstanding challenges. Laboratory methods of recognition, bacteriological or serological, are available in twenty-seven of the forty diseases.

Of the forty diseases twenty are primarily contact borne (chiefly infections of the respiratory tract), eight are in large measure spread by food (the intestinal diseases and trichinosis), seven are insect borne and five are of miscellaneous nature (actinomycosis, anthrax, hookworm, rabies and tetanus).

Practical methods of immunological control are available in twelve of the forty diseases (cholera, diphtheria, bacillary dysentery, Malta

TABULAR REVIEW OF CERTAIN MAIN FACTS RELATING TO THE CONTROL OF INDIVIDUAL COMMUNICABLE DISEASES

DISEASE	CAUSATIVE AGENT	SOURCE OF INFECTION	AGENT OR MODE OF TRANSMISSION	LABORATORY RECOGNITION AVAILABLE	ISOLATION OR QUARANTINE	ACTIVE IMMUNIZATION AVAILABLE	SPECIAL METHOD OF CONTROL
Actino-mycosis	<i>Actino-mycetes bonus</i>	Nasal and bowel discharges of men and animals, uncooked meat	Contact, uncooked meat	Yes	Neither	No	Meat inspection and control of disease in animals
Anthrax	<i>Bacillus anthracis</i>	Hair, hides, flesh and feces of animals	Wounds or scratches, inhalation of spores, meat	Yes	Isolation	No	Control of disease in animals, disinfection of hides and wool
Chicken pox	Unknown	Nose and throat discharges	Contact	No	Isolation	No	None
Cholera	<i>Vibrio comma</i>	Bowel discharges	Food, water, flies, contact	Yes	Both	Yes	Supervision of water and food
Dengue	Unknown	Blood	<i>Aedes aegypti</i>	No	Neither	No	Control of mosquitoes
Diphtheria	<i>Corynebacterium diphtheriae</i>	Nose and throat discharges	Contact, milk	Yes	Both	Yes	Active immunization of all children
Dysentery (amoebic)	<i>Endamoeba histolytica</i>	Bowel discharges	Water, food, flies, contact	Yes	Neither	No	Supervision of water and foods
Dysentery (bacillary)	<i>Erberthella para dysenteriae</i>	Bowel discharges	Water, food, flies, contact	Yes	Isolation	Yes	Supervision of water and foods
Epidemic (lethargic) encephalitis	Unknown	Nose and throat discharges	Contact	No	Isolation	No	None
Favus	<i>Achorion schoenleinii</i>	Lesions of scalp and skin	Toilet articles, contact	Yes	Isolation	No	Elimination of common toilet articles
German measles (rubella)	Unknown	Nose and throat discharges	Contact	No	Isolation	No	None
Glanders	<i>Pfefferella mallei</i>	Open lesions of men and animals	Contact	Yes	Both	No	Control of disease in horses

* Recent discoveries.

fever, measles, paratyphoid fever, plague, rabies, scarlet fever, smallpox, tetanus and typhoid); in pneumonia, tuberculosis and yellow fever promising experiments are under way and are already successful in certain forms of pneumonia.

A better idea of progress in the control of communicable disease may be obtained by considering those particular diseases which are of substantial importance as causes of death. Of the forty infections discussed nineteen are of minor significance, being either rare or very mild in nature. Eight are serious problems in tropical climates (cholera, amoebic dysentery, bacillary dysentery, hookworm, malaria, plague, typhus and yellow fever); all of these are controllable either by sanitation, mosquito eradication or vaccination. Thirteen are or have been of serious significance in temperate climates (diphtheria, gonorrhea, influenza, measles, meningitis, pneumonia, poliomyelitis, scarlet fever, smallpox, syphilis, tuberculosis, typhoid fever and whooping cough). Of these diphtheria, scarlet fever, smallpox and typhoid fever were of supreme importance in the past but now have been practically eliminated as important causes of death, while tuberculosis has been reduced to a fraction of its earlier importance. Gonorrhea, measles, meningitis, poliomyelitis and whooping cough cause a relatively small number of deaths, while influenza, pneumonia and syphilis remain with tuberculosis as the major outstanding problems.

To illustrate what has been achieved in disease control the figures for the city of New Haven, Connecticut, which are typical of those for other communities, may be cited. For the five years 1877-81 the death rate from all causes

in this city was 1820 per 100,000; for the five years 1922-26 it was 1250, a reduction of 31 percent. In this same period the death rate for pulmonary tuberculosis dropped from 282 to 41 per 100,000; for diphtheria, from 124 to 5; for typhoid fever, from 47 to 5; for scarlet fever, from 40 to 2; for infant diarrhea (not a specific communicable disease but a food poisoning due to bacterially polluted milk), from 105 to 19. These five causes together account for an average decrease of 526 deaths per 100,000, or nine tenths of the total decrease from all causes.

Of the four communicable diseases which are still important factors in the death rate among civilized peoples influenza and pneumonia furnish problems which await scientific solution. The germ of influenza is not known and the world is almost helpless before its periodic invasions. The organisms which cause pneumonia are known, but here too there is no practical method of control, although developments are anticipated along the lines of vaccine and serum prophylaxis and therapy. Tuberculosis and syphilis can be reduced in so far as the available medical and social measures are applied, for the former is controllable by early diagnosis and hygienic living and the latter by medical treatment and social hygiene. When these four diseases are conquered, one of the most significant chapters in man's conflict with his environment will have been successfully closed.

COMMUNICATION. It is obvious that for the building up of society, its units and subdivisions, and the understandings which prevail between its members some processes of communication are needed. While we often speak of society as though it were a static structure defined by tradition, it is, in the more intimate sense, nothing of the kind, but a highly intricate network of partial or complete understandings between the members of organizational units of every degree of size and complexity, ranging from a pair of lovers or a family to a league of nations or that ever increasing portion of humanity which can be reached by the press through all its transnational ramifications. It is only apparently a static sum of social institutions; actually it is being reanimated or creatively reaffirmed from day to day by particular acts of a communicative nature which obtain among individuals participating in it. Thus the Republican party cannot be said to exist as such, but only to the extent that its tradition is being constantly added to and upheld by such simple acts of communication as that John Doe votes the Republican ticket, thereby communicating a certain kind of message, or that a half dozen individuals meet at a certain time and place, formally or informally, in order to communicate ideas to one another and eventually to decide what points of national interest, real or supposed, are to be allowed to come up many months later for discussion in a gathering of members of the party. The Republican party as a historic entity is merely abstracted from thousands upon thousands of such single acts of communication, which have in common certain persistent features of reference. If we extend this example

into every conceivable field in which communication has a place we soon realize that every cultural pattern and every single act of social behavior involve communication in either an explicit or an implicit sense.

One may conveniently distinguish between certain fundamental techniques, or primary processes, which are communicative in character and certain secondary techniques which facilitate the process of communication. The distinction is perhaps of no great psychological importance but has a very real historical and sociological significance, inasmuch as the fundamental processes are common to all mankind, while the secondary techniques emerge only at relatively sophisticated levels of civilization. Among the primary communicative processes of society may be mentioned: language; gesture, in its widest sense; the imitation of overt behavior; and a large and ill defined group of implicit processes which grow out of overt behavior and which may be rather vaguely referred to as "social suggestion."

Language is the most explicit type of communicative behavior that we know of. It need not here be defined beyond pointing out that it consists in every case known to us of an absolutely complete referential apparatus of phonetic symbols which have the property of locating every known social referent, including all the recognized data of perception which the society that it serves carries in its tradition. Language is the communicative process par excellence in every known society, and it is exceedingly important to observe that whatever may be the shortcomings of a primitive society judged from the vantage point of civilization its language inevitably forms as sure, complete and potentially creative an apparatus of referential symbolism as the most sophisticated language that we know of. What this means for a theory of communication is that the mechanics of significant understanding between human beings are as sure and complex and rich in overtones in one society as in another, primitive or sophisticated.

Gesture includes much more than the manipulation of the hands and other visible and movable parts of the organism. Intonations of the voice may register attitudes and feelings quite as significantly as the clenched fist, the wave of the hand, the shrugging of the shoulders or the lifting of the eyebrows. The field of gesture interplays constantly with that of language proper, but there are many facts of a psychological and historical order which show that there are subtle

Communicable Diseases, Control of — Communication 79

yet firm lines of demarcation between them. Thus, to give but one example, the consistent message delivered by language symbolism in the narrow sense, whether by speech or by writing, may flatly contradict the message communicated by the synchronous system of gestures, consisting of movements of the hands and head, intonations of the voice and breathing symbolisms. The former system may be entirely conscious, the latter entirely unconscious. Linguistic, as opposed to gesture, communication tends to be the official and socially accredited one; hence one may intuitively interpret the relatively unconscious symbolisms of gesture as psychologically more significant in a given context than the words actually used. In such cases as these we have a conflict between explicit and implicit communications in the growth of the individual's social experience.

The primary condition for the consolidation of society is the imitation of overt behavior. Such imitation, while not communicative in intent, has always the retroactive value of a communication, for in the process of falling in with the ways of society one in effect acquiesces in the meanings that inhere in these ways. When one learns to go to church, for instance, because other members of the community set the pace for this kind of activity, it is as though a communication had been received and acted upon. It is the function of language to articulate and rationalize the full content of these informal communications in the growth of the individual's social experience.

Even less directly communicative in character than overt behavior and its imitation is "social suggestion" as the sum total of new acts and new meanings that are implicitly made possible by these types of social behavior. Thus, the particular method of revolting against the habit of church going in a given society, while contradictory, on the surface, of the conventional meanings of that society, may nevertheless receive all its social significance from hundreds of existing prior communications that belong to the culture of the group as a whole. The importance of the unformulated and un verbalized communications of society is so great that one who is not intuitively familiar with them is likely to be baffled by the significance of certain kinds of behavior, even if he is thoroughly aware of their external forms and of the verbal symbols that accompany them. It is largely the function of the artist to make articulate these more subtle intentions of society.

Communicative processes do not merely apply to society as such; they are indefinitely varied as to form and meaning for the various types of personal relationships into which society resolves itself. Thus, a fixed type of conduct or a linguistic symbol has not by any means necessarily the same communicative significance within the confines of the family, among the members of an economic group and in the nation at large. Generally speaking, the smaller the circle and the more complex the understandings already arrived at within it, the more economical can the act of communication afford to become. A single word passed between members of an intimate group, in spite of its apparent vagueness and ambiguity, may constitute a far more precise communication than volumes of carefully prepared correspondence interchanged between two governments.

There seem to be three main classes of techniques which have for their object the facilitation of the primary communicative processes of society. These may be referred to as: language transfers; symbolisms arising from special technical situations; and the creation of physical conditions favorable for the communicative act. Of language transfers the best known example is writing. The Morse telegraph code is another example. These and many other communicative techniques have this in common, that while they are overtly not at all like one another their organization is based on the primary symbolic organization which has arisen in the domain of speech. Psychologically, therefore, they extend the communicative character of speech to situations in which for one reason or another speech is not possible.

In the more special class of communicative symbolism one cannot make a word to word translation, as it were, back to speech but can only paraphrase in speech the intent of the communication. Here belong such symbolic systems as wigwagging, the use of railroad lights, bugle calls in the army and smoke signals. It is interesting to observe that while they are late in developing in the history of society they are very much less complex in structure than language itself. They are of value partly in helping out a situation where neither language nor any form of language transfer can be applied, partly where it is desired to encourage the automatic nature of the desired response. Thus, because language is extraordinarily rich in meaning it sometimes becomes a little annoying or even dangerous to rely upon it where only a

simple this or that, or yes or no, is expected to be the response.

The importance of extending the physical conditions allowing for communication is obvious. The railroad, the telegraph, the telephone, the radio and the airplane are among the best examples. It is to be noted that such instruments as the railroad and the radio are not communicative in character as such; they become so only because they facilitate the presentation of types of stimuli which act as symbols of communication or which contain implications of communicative significance. Thus, a telephone is of no use unless the party at the other end understands the language of the person calling up. Again, the fact that a railroad runs me to a certain point is of no real communicative importance unless there are fixed bonds of interest which connect me with the inhabitants of the place. The failure to bear in mind these obvious points has tended to make some writers exaggerate the importance of the spread in modern times of such inventions as the railroad and the telephone.

The history of civilization has been marked by a progressive increase in the radius of communication. In a typically primitive society communication is reserved for the members of the tribe and at best a small number of surrounding tribes with whom relations are intermittent rather than continuous and who act as a kind of buffer between the significant psychological world—the world of one's own tribal culture—and the great unknown or unreal that lies beyond. Today, in our own civilization, the appearance of a new fashion in Paris is linked by a series of rapid and necessary events with the appearance of the same fashion in such distant places as Berlin, London, New York, San Francisco and Yokohama. The underlying reason for this remarkable change in the radius and rapidity of communication is the gradual diffusion of cultural traits or, in other words, of meaningful cultural reactions. Among the various types of cultural diffusion that of language itself is of paramount importance. Secondary technical devices making for ease of communication are also, of course, of great importance.

The multiplication of far-reaching techniques of communication has two important results. In the first place, it increases the sheer radius of communication, so that for certain purposes the whole civilized world is made the psychological equivalent of a primitive tribe. In the second place, it lessens the importance of mere geo-

graphical contiguity. Owing to the technical nature of these sophisticated communicative devices, parts of the world that are geographically remote may, in terms of behavior, be actually much closer to one another than adjoining regions, which, from the historical standpoint, are supposed to share a larger body of common understandings. This means, of course, a tendency to remap the world both sociologically and psychologically. Even now it is possible to say that the scattered "scientific world" is a social unity which has no clear cut geographical location. Further, the world of urban understanding in America contrasts rather sharply with the rural world. The weakening of the geographical factor in social organization must in the long run profoundly modify our attitude toward the meaning of personal relations and of social classes and even nationalities.

The increasing ease of communication is purchased at a price, for it is becoming increasingly difficult to keep an intended communication within the desired bounds. A humble example of this new problem is the inadvisability of making certain kinds of statement on the telephone. Another example is the insidious cheapening of literary and artistic values due to the foreseen and economically advantageous "widening of the appeal." All effects which demand a certain intimacy of understanding tend to become difficult and are therefore avoided. It is a question whether the obvious increase of overt communication is not constantly being corrected, as it were, by the creation of new obstacles to communication. The fear of being too easily understood may, in many cases, be more aptly defined as the fear of being understood by too many—so many, indeed, as to endanger the psychological reality of the image of the enlarged self confronting the not-self.

On the whole, however, it is rather the obstacles to communication that are felt as annoying or ominous. The most important of these obstacles in the modern world is undoubtedly the great diversity of languages. The enormous amount of energy put into the task of translation implies a passionate desire to make as light of the language difficulty as possible. In the long run it seems almost unavoidable that the civilized world will adopt some one language of intercommunication, say English or Esperanto, which can be set aside for denotive purposes pure and simple.

COMMUNISM. The term communism, which is derived from the Latin word *communis*, does not occur before 1840, although the concept it embraces is as old as civilization itself. It was coined in the secret revolutionary societies of Paris between 1834 and 1839 and in a short time replaced such terms as community of goods, agrarian laws or *communauté*. Its general use is to describe the practise of or belief in the desirability of the social control of economic life, including the social ownership of property. It is distinguished in a technical sense from socialism, which means the social ownership of productive goods, in that it generally includes ownership of some or all forms of consumers' goods as well. In addition to this historical and general meaning the term communism in the years 1840-72 came to imply revolutionary action for the violent overthrow of capitalist society. Socialism, on the other hand, was the term used to describe constitutional activities for the reform of the economic system in the direction of national control of the means of production. Between 1872 and 1917 the two terms were looked upon as synonymous, or rather the term communism disappeared. With the rise to power in 1917 of Bolshevism in Russia the old distinction between the two terms was revived and sharply accentuated.

Underlying the general concept of communism are three basic doctrines. The first is that of the state of nature, or *jus naturale*, which in varying forms dominated the thought of antiquity and of the modern world from the Renaissance to the mid-nineteenth century. This doctrine is essentially utopian, rationalist and pacific. The second doctrine is Manichaeism, which considered human history as a ceaseless contest between two sovereign powers—good and evil, spirit and matter, light and darkness. Since private property riveted man to worldliness and materialism, he could overcome evil only through its renunciation and asceticism. The Manichaean doctrine, an Iranian offspring of Hellenic gnosticism, has points of similarity with primitive Christianity, which likewise regarded material possessions as an obstacle to salvation. All movements against private property and ecclesiastic officialism from the third century through the Middle Ages were more or less Manichaean; they were essentially ethical, antinomian, peacefully anarchic. The third

doctrine is Marxism or the economic theory concerning the rise and development of the productive forces of capitalist society, its inherent collectivist tendencies and antagonistic interests, with the class war as the human dynamic power of civilization. Philosophically Marxism rests on an inversion of the Hegelian dialectic evolution of the universe. Since the latter half of the nineteenth century it has been more or less the working hypothesis of international social democracy and since 1903 the orthodox doctrine and living faith of Bolshevik Russia.

Communism formed an integral part of the ancient myth of the golden age, the idealization by civilized man of the primitive, "natural" or tribal stage of human history. It was a reaction from the growing complications of ages of transition from nature bound existence to cultural exertions characterized by a more settled agricultural life, more intensive tilling of the soil, use of metals, rise of towns, growth of arts, crafts, trade and commerce, differentiation of society into various ranks with discordant interests and with wars against neighboring groups. Classical literature abounds in sentiments favoring the primitive and in longings for the simplicity of the golden age.

Beginning in the fifth century B.C. the Greeks set up as an ideal the laws of the legendary Lycurgus, who was supposed to have restored economic equality and healed the distempers of the Spartan state—poverty and riches. Plato, seeking to discover the causes of the disastrous Peloponnesian War, the decline of his country and the deadly class conflicts and feuds of Hellas, looked back and saw the past of Greece bathed in the golden rays of the harmonious state of nature, in which there was neither riches nor poverty, injustice nor strife. He became the age's foremost protagonist of communism. Plato argued that political democracy, which Pericles had glorified as affording to each citizen a share in the commonwealth, had failed to create harmony and civic virtue. The healing of the state must start with the restoration of harmony, and this could be effected only by establishing community of goods so as to afford to each citizen a real share, a stake in the lands of the commonwealth. In addition, Plato maintained in his *Republic* that the state needed a governing class of the highest quality of men and women. This was to be produced by a conscious selection for breeding and by thorough physical, moral and intellectual training. The selected

ruling class should own all things in common and all personal interests were to be subordinated to the welfare of the state. When the inhabitants of the state felt and thought as a unit, when the rulers were philosophers, then the state would flourish. In a later work, *Laus*, he expressed doubt as to whether community of goods and women had ever existed or would ever exist but advocated an approach to the ideal. Lands and houses were to be redistributed, but citizens should not cultivate their fields in common since the latter demanded a moral standard hitherto unattainable. Nevertheless, each recipient of an allotment was to think of his land as a portion of the common property.

The writers and philosophers of fourth century Greece seem to have been greatly preoccupied with the problem of the communal form of life. The notion had two formidable opponents in Aristophanes, whose *Ecclesiazusae* is an outspoken, spicy satire on community of love; and Aristotle, whose arguments in his *Politics* against his teacher's *Republic* constituted the most complete attack up to that time on what is now known as communism. On the other hand, the foundations of the doctrine of the state of nature were first laid in the same century. Aristotle relates with astonishment that opinions were spreading that "the rule of a master over slaves is contrary to nature and that the distinction between slave and free man exists by law only and not by nature; and being an interference with nature is therefore unjust" (*Politics*, I: 3; English translation by B. Jowett, 2 vols., Oxford 1885 vol. i, p. 5-6). This was the beginning of the revolutionary theory that not only had men been free in the golden age but that they were in fact free, servitude being the violation of a law superior to all constitutions and civil laws. While there had always been a higher or holy law it was conceived as originating in some divinity and subject to interpretation by priests. The new view traced such a law back to nature, if a divinely inspired nature, and made it subject only to the interpretation of philosophers. An important distinction is involved. The new views of nature as social legislator were co-ordinated at the beginning of the third century by Zeno, the master of the Stoa, who embodied them as a social science theory in a system which, as stoicism, influenced Roman and later European thought to a degree that can hardly be overestimated. It spread the doctrine that all men issued from the hand of nature peaceful and good, free and equal; that private property was

not known in the state of nature; that the remedy for all moral and social ills was to live in harmony with nature, to return to nature. Zeno outlined an ideal world state, in which mankind lived in liberty and equality, without state laws and, as far as may be inferred from literary fragments, which mention no provision for a medium of exchange, probably also with community of goods. A disciple of Zeno, Sphaerus the Borystenite, roused the Spartan king Cleomenes to his egalitarian land reform; another stoic, Blossius of Cumae, tutored Tiberius Gracchus and encouraged him in his agrarian agitation.

The Romans, among them Vergil, Horace and Ovid, made frequent use of the doctrine of the golden age. Roman statesmen and historians viewed the German tribes beyond the Rhine as enveloped in the luster of moral superiority shed by the state of nature. Julius Caesar related that the Suevi had "no private or separate holding of land," and of the Germans in general that "no man has a definite quantity of land or estate of his own," and that partly to prevent inequalities and to keep down the passion for gain they changed their habitations annually (*Gallie War*, IV: 1; VI: 22). In practise, however, stoics and those influenced by them were anything but hostile to private property and the accumulation of riches. Even those who glorified the golden age did not follow Horace's advice to throw their "jewels, gems and gold into the nearest sea" (*Odes*, III: 24, 45-50).

A broad current of *jus naturale* sentiment flowed from Rome through the empire at a time when old religious and ethical principles were being recast. It penetrated the movements which created the primitive church. What was with most Romans a poetic adornment became with many salvation seeking Jews a principle for the arrangement of daily life. The Jewish sage Philo of Alexandria wrote with admiration of the Essene practise of benevolence, equity and community in goods. Josephus Flavus shared his opinion and stigmatized Cain as the seeker of possessions, the Hebrew root *kn* signifying to acquire, to buy. The general effect of the Sermon on the Mount was that accumulated wealth shut its possessor out of the kingdom of God, while voluntary poverty was blessed and had a quasi-sacramental character. Under the personal influence of Jesus and His apostles many wealthy Jerusalemites shared their goods with the poor and all were "of one heart and of one soul . . . they had all things common" (*Acts* IV:

32). While Roman jurists eliminated "community of goods" from the definition of *jus naturale*, the fathers and doctors of the church were of opinion that in the original state of man the earth and the fulness thereof were held in common. The definition of *jus naturale*, as given by Saint Isidore of Seville, contains in addition to other specifications these two: *communis omnium possessio* and *omnium una libertas* (*Etymologiarum*, v: 4, 1). Gratian, the first compiler of canon law, brought together with delight the views of Christian writers in favor of community of goods (*Decretum Gratiani*, 1: Dist. 8, Dist. 88; 11: Causa 12, qu. 1, c. 2, a). Of the great fathers Saint Ambrosius declared that "... nature has poured forth all things for all men for common use. God has ordered all things to be produced, so that there should be food in common to all and that the earth should be a common possession for all. Nature therefore has produced a common right for all, but greed has made it a right for a few" (*De officiis ministrorum*, 1: 28, 132). Saint Jerome even accepted the widely current saying that the rich man is either unjust himself or the heir of an unjust parent. Statements of this type are frequent, but as a whole they do not prove that the primitive Christians, church fathers, doctors and canon lawyers strove for any sort of a communist rearrangement of society. Even the primitive Jerusalem communities had only a communism of consumption and not of production; each member worked as a private individual, sharing his produce or earnings with his fellows. Adverse pronouncements against private property amounted only to an admonition to Christians not to be addicted to worldly pursuits but to subdue avarice and share surplus wealth with the needy. They relegated community of goods to the region of the ideal, sanctioning private property on the theory that since the fall from grace avarice has created separate dominions and laws are necessary to regulate the division of possessions and to protect the weak against violence which would prevail were a return to the system of community of goods attempted. This admittedly led to a division of society into rich and poor, but the church view was that divine and natural law made it incumbent on the rich to relieve the poor from destitution.

The movement toward justification of private property began early. Tertullian and Saint Ambrose refer to the fall of man, to original sin, as the cause of his sinking to a lower moral level.

Saint Augustine, while accepting community of goods as a part of the state of nature, condemned the antiproperty doctrines of Pelagius and the Manichaeans and sternly reproved the revolutionary rising of the agricultural laborers (*circumcelliones*) in north Africa. These tendencies grew in strength as town civilization revived. Aristotle's philosophy prevailed over that of Plato. It found expression in the *Summa universae theologiae* of the English schoolman Alexander of Hales (d. 1245) and was adjusted to the economic and political conditions of the day by his younger contemporary, the Aristotelian Saint Thomas Aquinas, who set the economic doctrines followed by the Catholic church to this day.

Not all Christians, however, could adjust the teachings of Jesus or their own communist sentiments to the exigencies of civilization. The communist influence persisted in the East and in Egypt. Oriental mystics, given to a contemplative life, looked upon the renunciation of property as an indispensable condition of subduing evil. The mass of the dissatisfied Christians branched off into two movements, one heretical, the other monastic. The former took up a hostile attitude toward the church, charging it with worldliness and mechanical legalism. Among their sects, branded by the fathers as heretical, were those of Basilides, Valentinus, Carpocrates and his son Epiphaneus, the gnostics and later the Manichaeans, some of whom not only demanded the renunciation of property but set up as a positive aim the establishment of communism. Similar views were held by non-Christians. In the age of Christ the neo-Pythagoreans formed settlements in southern Italy, where ascetic communism was practised. Among the neo-Platonists communistic tendencies were rife; and one of their foremost teachers, Plotinus, the fellow student of Origen, used his influence with the emperor Gallienus in favor of the establishment of a communist colony to be named Platonopolis. Toward the end of the fifth century a mass movement against the landed nobility, led by the communist Mazdak, occurred in Persia.

Heretical sects, antinomian and antiproprietarian, became rather large in the first centuries of this era. With the spread of monasteries, however, mass heretical movements disappeared from view. The monasteries or cenobia (from the Greek *koinos bios*, community life), cloistered from the temptations of the world, sheltered all Christians who withdrew from material

pursuits to spend their life in ascetic self-discipline and community work. They must have also absorbed all those elements which in the absence of such a place of refuge would have turned heretical.

The situation changed in the eleventh and twelfth centuries. The church had become a world power and popes were statesmen engaged with emperors in a contest for supremacy. As the monasteries lost their fervor and were drawn into world affairs, heresy reappeared. At the turn of the twelfth century numerous sects known by the generic term Cathari (from the Greek *katharoi*, pure) had gained a footing in the trading centers of western, central and southeastern Europe and their doctrines were spread in part by the mass movements of the crusades. They sought to reorganize their religious, ethical and social life on a primitive Christian basis. Among them were the Patarins, the Poor of Lombardy, the Poor of Lyons, Waldenses, Albigensens, Bogomoli, Arnoldists, Humiliati, Communiati, Textores. Most of the Catharist sects lived austere lives, accepting gnostic-Manichaean doctrines and probably also the teaching of Joachim de Floris. Common to practically all were evangelical poverty, resistance to the worldliness of the church and monasticism and the rejection of official Christian sacraments, dogmas and authority. That many strove for communism may be seen from the statements of their persecutors. Of the Cathari of Montforte, near Turin, who were persecuted in 1030 on account of their rejection of the ecclesiastical mode of life, it is related that they declared *omnem nostram possessionem cum omnibus hominibus communem habemus* (*Monumenta Germaniae historica, scriptorum*, vol. viii, 1848, p. 65, line 44). The French theologian Alanus, in his *De fide catholica contra haereticos*, charges the Cathari with having appealed to the law of nature which dictates that "all should be in common" (Migne's *Patrologiae latinae*, vol. ccx, p. 366). The English prelate Walter Map reported of the Waldenses *huius certa nusquam habent domicilia, . . . omnia sibi communia* (*De nugis curialium*, ed. by M. R. James, Oxford 1914, p. 61). The Inquisition and special crusades, the German emperors of the twelfth and thirteenth centuries, the popes and the Dominicans, combined to exterminate these sects with fire and sword. Particularly thorough was the work performed by the Inquisition in France, and for centuries to come no social heresy could strike root there.

Thus when Europe was rent by a series of peasant wars the heresy of the *Jacquerie* in France was practically the only one which raised no demands for social reform. In the English Peasant War Wycliffites preached of Plato and proved by Seneca that "all things under heaven ought to be in common" (William Langland, *Piers Plowman*, Early English Text Society, Publications, original series, vol. xxxviii, 1869, ch. xx, line 274). In the Hussite wars in Bohemia the Taborites preached communism, and in the German Peasant War Thomas Münzer and the Anabaptists did likewise; the war had an epilogue in a communist rising at Münster.

The Renaissance and the age of the discoveries reconnected European social speculations with those of antiquity. Cosimo de' Medici established a Platonic academy, in which Marsilio Ficino taught Platonism and neo-Platonism to scholars from northern Europe, among them John Colet, who introduced Sir Thomas More into the study of the *Republic*. In humanist circles there was much sympathy with community arrangement of life. Erasmus, one of the most influential scholars of his time, declared that the true Christian should consider all his earthly goods as community goods. More's *Utopia* greatly heartened the humanists, who thought that societies could be constructed on a model invented by right reason and according to the tenets of *jus naturale*. The communist influence of Platonism was fortified by the effects of the discovery of America and the Atlantic islands. The tribes found in those regions appeared to live in a state of nature. To many travelers, writers and jurists the American tribes were a visual demonstration of the truth of *jus naturale*. Vespucci reported in his little tract *Mundus novus* that in the Canary Islands the people lived "according to nature; property they have none, but all things are in common."

The humanists did not see that western European society was moving in swift currents in the direction of individualism rather than of communism. More's *Utopia*, in fact, closed a period in which the doctrine of community of goods was still invested with some authority. In 1536, the year after Sir Thomas More's execution, Thomas Cromwell issued an injunction against teaching scholasticism and canon law. Henceforth the law of nature came increasingly to mean a protest against state interference with the course of trade and commerce, which were supposed to be governed by their inherent laws.

To the French physiocrats the law of nature meant freedom from state regulations, equality before the law, security of property. Even where the state of nature doctrine was used in the old sense it was bound up with the social contract and was directed not against property but by the representatives of property against feudal privileges and personal monarchy, as in the English civil war and on the eve of the French Revolution. From More's day until the middle of the nineteenth century communism meant only utopian writing or romantic experiments, generally by emigrant groups in overseas lands. Among those who produced literary utopias in those centuries were Andreae, Bacon and Harrington in England, Campanella in Italy and Morelly, Fourier and Cabet in France. Their later imitators have generally been regarded as little more than romancers. Jesuit settlements of Indians in Paraguay from 1610 to 1758 were the first of the long series of communist experiments in America which were to fill the history of pre-Marxian communism. They were inspired by a combination of missionary zeal and *jus naturale* views derived from the schoolmen and canon law. Other attempts to found communist colonies, such as those of the Fourierists, Owenites, Icarians, anarchists and other groups, although some were economically and socially successful for as long as a century, have generally proved impracticable in a world where the surrounding masses of population live in a totally different fashion. Nevertheless, this strain of communist thought continues to be the basis of some small settlements today, especially in the United States, and among Zionist settlers in Palestine.

On the extreme wings of both the English and the French revolutions were, however, small minorities who clung to the old notion of *jus naturale* and communism. These were Gerrard Winstanley and the Diggers in England, peaceful and mystical, and Gracchus Babeuf and his fellow conspirators in France, revolutionary, atheistic and the originators of the idea of a revolutionary dictatorship as the most effective instrument in the policy of abolishing private property and the building of a communist democratic state. The ideas of that conspiracy were transmitted by one of its principal authors, Filippo Buonarroti, to the young generation of Frenchmen who in the thirties of the last century worked in the Paris secret organizations either for a republic or for communism. The idea of the revolutionary communist dictatorship was spread by Auguste Blanqui, leader of

the Paris secret organizations after 1836, and later it inspired Karl Marx, on whose teachings modern communism is largely based.

During the nineteenth century rising socialist and land reform movements referred to the works of scholars such as Georg Hanssen, J. M. Kemble, August Haxthausen and Georg L. von Maurer to prove the existence in earlier ages of agrarian communism as a form of social organization, seeking therefrom further justification for their positions. Furthermore, as a result of Friedrich Engels' study of Lewis H. Morgan's work, Marxian views of the development of property were connected with the history of primitive communism. Ethnologists and economic historians began after 1875 to reexamine the origins of property in land. Primitive agrarian communism, hitherto generally accepted as a fact, came to be one of the most debatable problems of economic history and ethnology. Among those who have defended the notion that primitive agrarian communism was a reality are, in addition to those mentioned, such great scholars as Erwin Nasse, Sir Henry Maine, Émile de Laveleye, William Stubbs, Lewis H. Morgan, Otto von Gierke and Maxim Kovalevsky. They believed that they found corroboration of their opinions in the statements of Caesar and Tacitus concerning the Germanic tribes, in travelers' reports of social conditions among primitive populations and finally in the Russian *obshchina*, the south Slav *zadruga*, in some remnants of the *Mark* system in southwest Germany, in the Swiss *allmende* and in the Chinese well-field-system (*Schids*, or *Tsing-Tien*).

The opposing school, led by Fustel de Coulanges, attempts to prove either that from the beginning of human history there existed private property and no other form or that where collective agricultural associations existed they were a late creation arising from external pressure, e.g. in the case of the *obshchina* and *zadruga* from the desire of governments or feudal authorities to impose upon the whole village or a number of families collective liability for taxes or rent. The most scholarly part of the controversy turns upon the original conditions of the Germanic tribes, and closely connected with it is the question of whether the Anglo-Saxon settlement in pre-Norman England proceeded on Roman or Germanic lines. Max Weber, with his encyclopaedic knowledge of the social sciences, declared in his last work that the theory of primitive agrarian communism could neither be proved nor disproved (*Wirtschaftsgeschichte*,

Munich 1923; tr. by F. H. Knight as *General Economic History*, New York 1927, p. 24-25). The effect of the controversy has not been barren of results, however, since it has made the adherents of the theory less dogmatic.

Whatever the truth of the theory may be, Marxian communism does not depend on it for justification. Nevertheless, Marxian communism reflects the same sentiments which underlay earlier communist movements based on a theory of primitive communism or the reign of *jus naturale*. With such movements modern communism shares a position consisting chiefly in the repudiation of private property in production and consumption goods and a demand for a fundamental, radical reconstruction of society as the only means of achieving harmonious and ordered social existence. The particular turn which communist thought and practise have since taken was dictated by communist views of capitalist industrial society. Modern communism has become instead of a myth or the subject of literary romance a practical goal and program in the form of Marxian socialism agitated by international socialist groups and regarded by them as the inevitable next step in social development, to be brought about by a class whose self-interest drives it to such a type of economic and social organization.

COMMUNIST PARTIES are the political organizations of the communist movement and aim to realize the ideal of communism by means of revolutionary action culminating in the dictatorship of the proletariat. Their character is shaped by the ideology of modern communism which, like socialism, has its basis in the Marxian philosophy of history and theory of class struggle. From Marx modern communism derives its striving for a monism of theory and practise; the dialectic method of viewing all phenomena as moving from thesis through antithesis to synthesis; and the conception of history as a dynamic process of class struggles which is determined by the system of relationships in production, and which in its present stage of evolution is leading to a collision of the bourgeoisie and the proletariat eventuating in the overthrow of capitalism and in the rebuilding of society on the principles of common property, economic equality and social harmony. In so far as modern communism has modified Marx it has done so chiefly by elaborating the analysis of the latest phase of capitalism or imperialism and by formulating more clearly the dynamics of social revolution. This was the work of Lenin, and the communists regard it as of equal significance with that of Marx and justifying the designation of present day communist theory as Leninism-Marxism. In this modified form communism is a distinctive social synthesis. Communists regard this synthesis as a completion of Marxism; socialists as a deviation from Marxism. In some of its aspects modern communism is a return to Marx of the period of the Communist League from 1848 to 1851, but it also shows traces of syndicalism and Blanquism and the influence of the conditions resulting from the World War and the Russian Revolution.

Proceeding from Marxian premises modern communism views the present stage in the history of the world as the last phase of capitalism, which it designates as "finance capitalism" or "imperialism." This epoch is characterized by two main features, the growth of monopoly and the control of industry by finance. The basic ideas of communism are that imperialism is the epoch of the decay of capitalism and that this epoch began with the World War and the Russian Revolution. In this general epoch communism distinguishes three successive stages. The first stage, from 1914 to 1923,

witnessed the break in the capitalist system, the first struggles for power of the proletariat, which resulted in the victory of the Bolshevik revolution in Soviet Russia and in the revolutionary uprisings of other countries. The second period, the following four or five years, was characterized by a partial stabilization, during which capitalist production recovered to pre-war levels, improved its technique and mechanisms and intensified its pressure upon the workers in the industrial countries and on the masses in the colonial and semicolonial countries. At present the world is in the third stage, a new period of general crisis and rapid decline for capitalism. The cause of this new crisis is the growing disparity between productive capacity and restricted markets, which results in industrial depression, in unemployment and in intensified conflicts both within and between countries. Within each country there is a resurgence of industrial unrest and of social struggles in the form of strikes, mass demonstrations and political upheavals. In international relations the growing conflict is manifested in three main ways: in the clashes between the imperialist powers and the colonies, in the hostility of the entire capitalist world toward the Soviet Union and in the antagonism between the United States and Europe. The new revolutionary rise, resulting from the accentuation of the external and internal contradictions of imperialism, presages the possibility of a general social revolution in the not distant future. But that does not mean that all revolutions in all countries must be at once victorious and that all conflicts between states must immediately end in war. The social revolution must be conceived not as a single act, not as one struggle on a single front, but as a whole epoch of sharpened class struggles, as a long series of battles on all fronts, as a prolonged process of economic and political upheavals, which may have some partial failures but which will end finally in the expropriation of the bourgeoisie and in the triumph of the workers.

The communists visualize the ultimate end of this revolutionary process as the establishment of a world communist society, but in the immediate future a successful revolution can be merely the first step toward such ultimate aim. In contrast to the older socialist concept modern communism, largely under the influence of the Bolshevik experience in Russia, stresses the necessity of a long process of "building socialism." The Marxian concept of a

transition period between capitalism and socialism assumes in the communist analysis new form and greater importance. The transition period becomes a fairly long historic period during which a creative process of reorganizing the economic, political and cultural life of a country is to be completed. During this transition period communism proposes to use all the centralized powers of the state and as much force as may be necessary in order to nationalize industry, to crush all resistance to the plans of revolution and to enforce those economic measures by means of which the socialist system is to be constructed. The state which is to carry through this task is conceived not as the democracies of today but as an entirely new form of political organization characterized primarily by the concentration of all authority in the hands of the proletariat, represented by the Communist party, and by the frank avowal that it is a dictatorship of the proletariat and a class rule. The prototype of this dictatorship is the political system of the Soviet Union.

Communist action thus centers around the concept of the dictatorship of the proletariat. The social revolution is a series of successive proletarian dictatorships established in one country after another until they embrace the entire world and form a world dictatorship which will begin the systematic reconstruction of world economy on a socialist basis. The main task of the communist parties is to watch developments in each country and to be ready, whenever a country reaches the breaking point, to step into the breach, seize power and establish a proletarian dictatorship. In view of the undermined condition of capitalism which characterizes the present stage of history the social revolution may blaze up not only from a new war but also as a result of some large strike or some street demonstration, hunger riot, military revolt or colonial rebellion. Any movement which upsets the equilibrium of capitalism has revolutionary possibilities and revolutionary value, and the general task of the communist parties is to carry on a theoretical and practical struggle for the dictatorship of the proletariat. The revolutionary process takes on different forms in different countries. While the direct struggle for the conquest of power can be carried on best in the advanced industrial countries, nevertheless in backward countries it is possible to unite such workers as there are with the poorer strata of the peasantry. In some countries of lesser industrial development it is necessary to

fight for political rights and for agrarian changes. In colonial and semicolonial countries the struggle for national independence and against the imperialist powers is essential.

This view of historical development has important effects upon the character of communist tactics and of party organization. Following Marx the communists proceed from the assumption that the working class is the only class which has the historic mission of reorganizing society and that the Communist party is the vanguard whose function it is to assume leadership in carrying out the program of social revolution. But in the present stage of development the workers are far from being a majority, even in many advanced industrial countries, while large sections of the world are dominated by agrarian and colonial relations. This situation is met by the theory that imperialism supplies an economic basis for an alliance between the workers and the masses of the peasantry in all countries, an alliance in which the proletariat, through the Communist party, assumes political and social leadership. This theory supplies the foundation for the practical efforts of the communist parties to cooperate with agrarian elements wherever they are strong and to participate directly in the nationalistic movements of India, China and colonial countries.

The communist parties of today may be traced to groups of Lefts and radicals in the pre-war socialist parties of Germany, Austria, France and Russia and in the Second International, which for a decade before 1914 fought against the socialist "revisionists" (Bernstein, Jaurès, Vollmar) and the so-called socialist "center" (Bebel, Kautsky, Plekhanov), demanding a more vigorous class and antimilitarist policy. Those groups supplied the nucleus of the rebellion against the official socialist acceptance of patriotic duties in the World War in 1914 and 1915. The insurgent elements, loosely designated as Zimmerwaldians (from the name of the Swiss village where they held their first international conference in 1915), were led by such men as N. Lenin and L. Martov of Russia, Robert Grimm of Switzerland, A. Bourderon and A. Merrheim of France, A. Hoffman and G. Ledebour of Germany. Of those the left wing met at Keinthal, Switzerland, in 1916 and under the leadership of the Bolsheviks (the Russian majority socialist group) adopted a program of working to turn the international war into a civil war or class war. The Bolshevik revolution in November, 1917, precipitated a further realign-

ment within the international socialist movement on the issue of "democracy versus dictatorship," which in practise meant being for or against Bolshevik policy in the Soviet Union. Feeling that a clear cut break in the socialist movement would help their cause the Bolsheviks, until then known as the Social Democratic party of Russia of the Bolshevik faction, at a party conference in March, 1918, changed their name to that of the Communist party of Russia, to indicate their complete separation from the socialist movement.

Until the end of the war the Russian Communist party was the only Communist party in the world. The socialist groups in different countries which were against the war and in sympathy with the Bolsheviks were known under a variety of names, such as Independents, Spartacus Bund, Socialist Minority, Left Wing Socialists and so on. The German revolution led early in 1919 to the formation of the first Communist party outside Russia, namely the Communist party of Germany, which was formed by the amalgamation of the Spartacus League with the group *L'Internationale* and with the more radical section of the Independent Socialists. These were the only two communist parties in existence when the Russian Communists issued their invitation to an international conference in Moscow in March, 1919, which organized the Third or Communist International and which definitely inaugurated a communist movement on an international scale, distinct from and in opposition to the socialist movement.

At first the Communist International was a conglomeration of all sorts of left wing groups and parties which had in common their opposition to the war, their disgust with the old leaders of the Second International and their demand for a larger measure of recognition of socialist ideals in the making of peace. It was the conscious and systematic policy of the Third International under Bolshevik guidance to win over these dissident groups and to reorganize them into communist parties. Wherever such efforts were unsuccessful the Third International adopted the policy of splitting off major or minor sections from existing parties and of forming them into distinct communist parties. In this way communist parties were organized in 1919 and 1920 in many countries of Europe and in America with a common platform which urged action for an immediate social revolution. In 1921 in order to consolidate their gains the leaders of the Third International adopted a

deliberate policy of making membership in the Third International difficult of attainment. Greater emphasis was put on the revolutionary object of communist tactics, and to drive away those unprepared to carry out such tactics at all costs a program of twenty-one points was drawn up and made a prerequisite for admission. This had the effect planned; numerous Left Socialist groups, especially those which established the Vienna Working Union of Socialist Parties (the so-called Two and One Half International), held off from the Second or Socialist International for a long time but finally abandoned all plans of joining the Third. Between 1921 and 1924 the Third International was instrumental in strengthening the parties formed before 1920 and in organizing many new ones. The communist reverses of 1923 and world stabilization, which came about after 1924, belying the forecast for an immediate revolution, threw all communist parties into a state of inner chaos which threatened to disrupt them completely. The Sixth World Congress of the Third International in 1928 succeeded in overcoming this internal crisis and restated the doctrines of communism in the manner outlined above, re-emphasizing the distinctive features of communism as a world movement and giving the various communist parties a firmer basis for immediate action as well as for revolutionary propaganda.

At present communist parties exist in over fifty countries. Disregarding minor differences they are organized more or less alike. Any individual who accepts the program and principles of communism and who pledges himself or herself to work actively on behalf of these principles and to submit to communist discipline may become a member of the party. Preference is accorded to working people; and in some countries, notably in the Soviet Union, there is a probationary period in which prospective members are candidates and have to prove that they are worthy of being admitted to the party. The unit of the Communist party is a nucleus or cell which is composed of a group of people who work in the same place—factory, farm, store or other enterprise. Every member of the Communist party of a country is inscribed in one or more cells. In addition to these industrial cells there are street cells, which unite communists living in the same neighborhood. The cells are the meeting places where all questions of the communist movement come before the rank and file of the members. There are wide differences

in different countries in the extent to which this cell organization is in operation. In some countries the communist parties are still largely organized on the basis of residential membership.

Factory and street cells are combined to form larger local and district organizations which make up the national party. With minor variations all communist parties are governed by a central executive committee elected at a national conference of delegates. The central executive committee meets only a few times during the year, and power in the interval is vested in a smaller body composed of five or seven members and known as the political bureau, *politburo*. In their internal relations the communist parties are built on the basis of "democratic centralism." Every organ of the party must carry out promptly and accurately the decisions of higher officials and every individual member of the party must submit to iron discipline. He who weakens the iron discipline of the proletariat, no matter how little, say the communists, helps the bourgeoisie against the proletariat. Before a decision has been taken by the party the members are free to discuss the issue at their cell meetings and in party circles. But once a decision has been made by the party through its directing organs, every member must submit to it unconditionally. No communists are permitted, either individually or in groups, to oppose the party, to form factions or groups.

The communist parties in the different countries are sections of the Third International. The relationship is not that of a federated association but of a united and centralized political combination. The Third International is conceived of and operates as a world party in which the separate communist parties of the different countries are not autonomous members, but subordinate parts governed by the same principles of democratic centralism which prevail within the separate sections. This form of organization has the purpose of giving the Third International that unity of purpose and of action which is one of its main desiderata and which has shaped its internal structure since its inception. The supreme organ of the Third International is a world congress which meets at call. The world congress examines all questions of theory, policy and organization and acts as the general directing body, unifying communist doctrine and tactics. It elects all the executive officers of the International and is the court of appeals to which any member or group or entire

party may bring complaints. The world congress of the Third International is an assembly of delegates from the communist parties and allied organizations of the different countries. The number of delegates which every Communist party may send to the congress is fixed by the executive committee of the International while the number of votes is fixed by the congress itself on the basis of membership and of political importance. Between congresses the Third International is governed by the E. C. C. I. (Executive Committee of the Communist International). The communist parties of the different countries are arranged in groups and each group is allowed one or more delegates on this committee. In selecting these delegates each country or group of countries may put up candidates but cannot insist upon their election, which is subject to the final decision of the world congress.

In accordance with the principle of democratic centralism the E.C.C.I., which at present is composed of fifty-nine members and forty-two candidates, has the power to issue imperative instructions to its sections and to exercise control over their activities. It may annul or amend any decision adopted by the executive committee or by the national conference of any Communist party. It may issue obligatory orders and may expel individuals, groups or whole parties for alleged violation of communist principles and policies. The executive committees of the communist parties in the different countries are accountable to the E.C.C.I., must make regular and detailed reports of all their activities to it, must remit to it dues as fixed and must obtain its approval for the calling of their national conferences. No member of any executive committee of any section has the right to resign his position without the consent of the E.C.C.I.

Besides the sessions of the E.C.C.I., which take place at least once every six months, there is held twice a year an Enlarged Plenum of the executive committee. This is composed of the members of the E.C.C.I. and of delegates from the communist parties whose number is fixed by the executive committee. In the last few years these plenums have usually brought together from 100 to 200 delegates. The Enlarged Plenum has none of the powers of the world congress but its resolutions and recommendations serve as a guide to the communist parties, pending the decisions of a world congress. Between the sessions of the E.C.C.I. the affairs

of the Third International are in the hands of a Praesidium elected by the E.C.C.I. consisting of some thirty members and nine candidates, who meet in Moscow, the headquarters of the Third International, every two weeks. The Praesidium elects a political secretariat of eleven members and three candidates, who reside in Moscow and who direct the work of the Third International. The work is departmentalized. There are eleven national secretariats as well as an international woman's secretariat, a division for organization (*orgburo*), a division of information and statistics, a division of propaganda and agitation, a division of the Orient and several others.

At the Sixth World Congress of the Third International, held in Moscow from July to September, 1928, there were represented 66 parties and allied organizations, with a total membership of 4,024,159. Included in this total were 2,225,300 members of the communist youth leagues. The membership of the communist parties proper was 1,798,859. Of this total membership 1,200,000, or nearly three fourths, were in Russia, and of the remainder over 300,000 are found in Germany, Czechoslovakia and France. Communist membership in all countries is subject to a high rate of turnover and to rapid ups and downs under the influence of political conditions. For instance, in England the membership of the Communist party rose from 6000 to 9000 between 1926 and 1927 and dropped to less than 5000 in 1929. In the United States the membership of the Communist party has fluctuated from 20,000 in 1924-25 to about 11,000 or 12,000 in 1928. In Sweden the membership has risen from over 10,000 in 1926 to about 18,000 in 1930. In countries where the communist party is an illegal organization there is of course no way of estimating the total membership.

The strength of the communist parties and their activities vary from country to country in accordance with economic and political conditions. *Sui generis* is the Russian Communist party, which is the ruling party of the Soviet Union. It has an elaborate party machinery and large funds, it is the power which directs the internal and foreign policies of the Soviet Union, and it is of immense importance in world politics and economics. Outside Russia the communist parties of Germany, France and Czechoslovakia have substantial organizations, their own buildings, maintain large offices and publishing houses and edit many daily, weekly and monthly periodicals, which have fairly large

circulations. In these countries too the communist parties are important factors in the political life of the country, having substantial groups of representatives in the national legislatures and in the provincial and municipal councils. In Germany the communists polled about 3,230,000 votes in the national elections of 1928 and over 4,500,000 votes in the elections of 1930. In France the communists polled over 1,000,000 votes in 1928. In Czechoslovakia the Communist party, which was at one time the strongest political party in the country, is, although much weakened, still of importance in the national parliament. Communist parties are fairly strong in Finland, Poland and Norway. In Austria, Switzerland, Denmark, Holland and Belgium the communists have been unable to make much headway against the socialist organizations and consist of small agitational groups confined largely to verbal agitation and propaganda, especially in the trade unions. The same is true of England and the United States. In Spain, Italy, Hungary, the Balkans, Poland, China, Egypt, Latin America and in some of the colonies the communist parties are illegal or semi-illegal organizations and their work is carried on underground or in disguise, resembling in some ways the work of the Russian Bolsheviks under the czar. They organize secret societies, have secret printing plants, publish leaflets and pamphlets illegally, maintain underground contacts with workers in factories and on the farms and prepare mass demonstrations and uprisings. In all countries where military institutions are strong the communists try to organize cells in the army and navy, while in the countries of Asia, Africa and Latin America they are active in organizing the extreme elements in the nationalist, agrarian and anti-imperialist movements.

The communist parties in all countries have a number of adjunct, allied and sympathizing organizations which they use either for special activities or for boring their way into the general economic and social institutions. This is made necessary by the communist idea of the party as a limited organization composed of specially selected and disciplined members who must win the support of a majority of the working people in order to carry out the socialist revolution. The communist idea of leadership lays stress on organized elements in the population; the winning of a popular majority therefore becomes in the first place an effort to win leadership within organizations already created by the masses. Of

these, communists attach prime importance to the trade unions as especially fit instruments for their purposes—as the schools of communism today and as important machinery for socialist activity during the dictatorship of the proletariat. For these reasons the communists in all countries have been especially active in their efforts to win over existing trade unions; today these tactics are applied chiefly in England, Germany, Sweden, Switzerland and Austria, where communists organize what they call “trade union oppositions” in the existing trade unions. Where that is impossible they try, as in France, Czechoslovakia, Yugoslavia, Bulgaria, Rumania, Finland, the United States, Cuba, Mexico and a number of other countries, to build up rival unions under their own leadership. Aside from the trade unions the communist parties in the different countries have under their direction unemployed councils, communist youth leagues, children’s leagues, Red sports societies, Red Front leagues and a number of other organizations. They are also connected with various farmers’ and peasants’ societies and with such organizations as workers’ defense leagues and workers’ relief societies. All these subsidiary and auxiliary organizations in the different countries are combined internationally and form respectively the organizations known as the Red International of Labor Unions, or the *Profintern*, a rival to the Amsterdam International Federation of Trade Unions, the International Peasants’ Council, the Communist Youth International, the International Children’s Bureau, the Red Sports International, the International Workers’ Relief and the International Red Aid. All these international organizations work either directly under the control of the Communist International or in cooperation with it.

The specific tactics of the communist parties in the different countries are in a state of continuous flux. While this is designated by non-communists as opportunism, the communists themselves regard it merely as evidence of their realism and of their capacity to adjust means to ends. Since 1921 communist tactics have had a unifying feature in the advocacy of the “united front.” United front tactics consist in taking advantage of every economic or political situation in the daily life of a country for the purpose of putting forth concrete demands and slogans and for calling upon all workers to unite for attaining these demands. While the communists claim that the “united front from below” is a

method for drawing the backward workers into the class struggle, their chief interest is to use it to undermine the non-communist leadership in trade unions, cooperatives and other labor organizations in favor of themselves. At present the general slogans of the Third International are: “united front from below” and “the organization of tactics on the basis of partial demands.” As interpreted by the Praesidium of the Communist International early in 1929 and reaffirmed recently this means that the Communist party of Germany must be most active in the reformist trade unions and must consolidate the ranks of the so-called trade union opposition; that the Communist party of France must set up cells in all factories and strengthen the communist trade unions so as to reorganize the party on the basis of industrial units; that the Communist party of Great Britain must increase the influence of its daily paper, the *Daily Worker*; that the communists of the United States should strengthen the new trade unions and use them as the framework of the United States communist movement; that in those colonial countries in which they do not already exist, as for instance in India, communist parties must be set up and must assume a leading position in the national revolutionary movements, especially in the work of drawing into this movement the masses of the peasantry.

Since its inception the Third International has acted as the main cohesive force of the communist movement. It not only created the first communist parties but nursed them and watched over them throughout all the difficulties of growth. At the present time the Third International continues to play this role toward the communist parties of which it is composed. It supplies the intellectual pabulum, the practical aims and also the financial means wherever that is necessary. The headquarters of the Third International in Moscow is the scene of continuous meetings of leading communists from all countries for the purpose of maintaining contacts and of giving unity to the movement in different countries. Through its power of expulsion and of discipline the Third International can purge any Communist party of whatever elements are opposed to it and place in leading positions the men and women who are trusted by it and who are willing to follow its directions. Financially the Third International is ready to help the weaker parties in the different countries to a considerable extent; its own reports show that in 1927 it spent about \$345,000, or over 50

percent of its total receipts, to subsidize communist parties in seventeen different countries for newspapers, pamphlets, organizing and cultural work.

The growth of the communist parties in all countries is hampered by three main difficulties. One follows from the nature of communist work in general. Penetrating into all economic and social institutions and playing a leading part in them is an enormous task and both the theoretical and the practical work of the communists fall far short of the aims set in any country. The attempt, essential to their tactics, to reconcile concern for practical demands with eagerness for an immediate social revolution causes serious practical contradictions, so that communists often pull too far to the left in their eagerness for revolution or fall to the right, becoming engrossed in immediate demands. The Third International itself has constant occasion to reprove member parties for one or another of these errors. The theory of the united front has been particularly difficult of correct interpretation. In some cases communists have formed election blocs with Left socialists, in others they have failed to participate in activities regarded by the International as having revolutionary importance. Another difficulty is one common to every mass movement. Despite the fact that the communists may rely in some countries on an unusual homogeneity of economic backgrounds and interests to unify the attitudes of their members and on a general conscious theoretical unity rare in large political groups, the parties do include such heterogeneous elements as workers, peasants and professionals; people of both sexes, of different ages, levels of education, social contacts and mental and moral habits. Consequently it is difficult to maintain the iron discipline which is in theory the basis of their organization and to carry out democratic centralism in a manner always conducive to the smooth working of the party machinery. Difficulty also arises out of the relations of the communist parties to the Third International and out of the close connection of the Third International itself with the Bolshevik government of the Soviet Union. The Third International is essentially concerned with the world situation and with an effort to create a world movement. But like all leaderships its executive committee often finds it difficult to muster the intellectual and material resources necessary for carrying on such a movement and at times makes erroneous decisions which it must later reverse. The Third

International's power to enforce its decisions against the national parties, while it helps create unity of program, also frequently curbs independent effort and local initiative, as centralized control always tends to do. Because of its close connection with the Russian Communist party and through the latter with the government of the Soviet Union the Third International inevitably places in the center of its interests the economic development of Soviet Russia and tends to orient the communist parties of the world from this point of view.

These difficulties within the communist parties are the cause of the continuous formation of groups, factions and oppositions in the separate countries and of repeated splits and factionalism within the Third International itself. Since its inception the Third International has insisted that factionalism is the supreme crime of the communist movement, yet in the ten years of its history it has witnessed a succession of factional movements in practically every Communist party. The two greatest factors of internal friction have been the question of trade union tactics and the problems of the economic development of the Soviet Union. The factionalism created by these two factors has assumed international proportions and given rise to intense opposition movements which have caused the Third International serious trouble. The result has been a series of splits, resignations and expulsions which have lost to the party a number of active and influential leaders. At the present time the Third International claims to have overcome all factionalism, having expelled from its midst both the so-called Left Trotskyists and the so-called Rights. But current events and discussions within the Third International indicate that the elements of factionalism are still there. The Trotskyist Left, which is organized as small groups outside the Third International in Germany, the United States and several other countries, has followers and sympathizers in the regular communist parties of many countries and also within the Third International itself. The so-called Right, which assumes different forms in different countries, calls for more moderate economic and social policies; it is an especially important element in the Communist party of the Soviet Union. Judging on the basis of the experience of a decade one may say that while the readiness of the Third International to apply rigid control and the willingness of the majority of communists to submit to iron discipline, abandoning individual or local views when

they conflict with the policy of the central body, may curb or suppress factionalism, it seems certain that the principles of iron discipline and democratic centralism often make it difficult to effect changes of policy smoothly.

The future of communism is closely related to the future of the Soviet Union, and their interaction is of world wide importance. The Soviet Union in its economic and political activities continues to draw support from the existence of a communist movement throughout the world. On the other hand, the prestige of the Communist party in the Soviet Union and the success of its economic policies continue to feed the communist movements of the world. Nevertheless, were conditions in the Soviet Union to change in such a manner as to undermine this interrelationship there would still probably emerge a left wing socialist movement similar to the present communist movement.

Popular notions of communism are influenced to a great extent by local political and cultural conditions. In France familiarity with revolutionary movements in the past makes communism appear to be merely a modern edition of old revolutionary forms. The view common in the United States that the communists are either cranks or criminals is largely a reflection of a conservative outlook. To many the communists represent violent and radical change incarnate, and the usual forces of vested personal or class interests, habit, fear and authoritarian or traditionalist theories arouse an even more intense opposition to communism than is generally called up by suggested innovation. Those who attack communism frequently are ignorant of its purposes, aspirations and theories and lump together as insane, wicked or antisocial such diverse and mutually antagonistic movements and theories as communism, socialism, syndicalism, anarchism and pacifism. Anticommunist organizations spread many unfounded statements against communism and its followers, which gain a ready hearing in large portions of the population a priori opposed to any significant change in social organization. The greatest hostility toward the communists is usually found among the socialists and trade unionists, against whom the communists are carrying on their campaigns. This is an inevitable result of communist theory and tactics. Since the communists are guided by the idea of a possible social revolution in the near future and believe that such a revolution may be precipitated by one or another fact of social conflict, they are inevitably forced

to be continuously agitating and magnifying every form of social strife. Since their strategy centers around the idea of winning leadership they are also inevitably compelled to attack those who already hold the leading positions in labor organizations, and the latter retaliate in kind. The communist argument against the socialist and trade union leaders is that they propose only reformism. Reforms, the communists contend, are but palliatives; at best they mitigate temporarily evils which cry for a complete change and at worst they throw a cloak over the running sores of society. The ruling class will furthermore accept only such reforms as in reality do not threaten their interests. Aside from the fact that the ruling class controls schools, churches, press, political parties, radios and every other cog in the machinery of democratic government and therefore can prevent for an incalculably long time if not forever the triumph of the proletariat by democratic means, the communists maintain that whenever the proletariat threatens to obtain a parliamentary majority or to introduce changes in any legal fashion which challenges vested interests the ruling class leaves the path of constitutionalism and democracy and to prevent such changes uses or threatens violence. Hence, communists argue, reformism is worthless and even harmful in so far as it leaves the proletariat unprepared for the final struggle which must come about.

As long as large masses in our industrial countries consider themselves exploited some form of revolutionary doctrine is inevitable. The continued development of the Soviet Union would doubtless assure the fact that communist parties will articulate the revolutionary doctrine and remain a factor of continuous agitation and of economic and political disturbance in countries dominated by capitalism.

COMMUNISTIC SETTLEMENTS. Communities have frequently ordered their lives communistically in one respect or another. The degree of communism practised among the German tribes as described by Tacitus and Caesar may, with the theory of the village community itself, remain obscure. There is, however, no doubt that in many primitive societies and among ancient Greeks and Hebrews some forms of communistic practise were followed. It should be realized, however, that the famous citizens' meals of Sparta were little more than a military training table and that Sparta was so far removed from true communism in principle or practise that its whole social system was based upon helot labor. The early Hebrew communal land ownership was an incident of pastoral life rather than part of a systematic collective ownership of production goods.

By the second century B.C. true communism was introduced among the Hebrews by the Essenes, a highly intellectual, largely celibate group, living in complete consumption communism, sharing houses, meals, clothing, storehouse and even a community purse. Candidates for admission to the group turned goods into the common fund; interchange among members was free, no money being used; luxury and the owning of slaves were forbidden and charity to out-

siders approved. The early church at Jerusalem showed for a brief period a similar tendency in the field of consumption. Believers "had all things common . . . and parted them to all . . . as every man had need" (*Acts* 11: 44-45; 1V: 32). This tendency soon disappeared from the main body of the Christian church, however, to reappear later chiefly in a succession of dissident groups. It should be noted that these early communistic groups, living in a comparatively simple economic world, were able to achieve their end of "dividing up" consumption goods without rearranging in any way the ownership or control of the simple production goods or processes then available.

Beginning with the Benedictine order in the sixth century monastic life, with its vows of poverty, chastity and obedience, its probationary term and life membership, revived complete community economic control and other communist practises with highly productive results. An abbot elected for life ruled each chapter of the order. Members were required to labor at tasks economically profitable to the collectivity; all lived, ate and worked in common quarters.

Again, in the Jesuit "republics" of Paraguay a therocratically ordered collectivist life prevailed for a century and a half with mixed communist and cooperative aspects. Settling in 1602 in pairs over a vast territory from which other whites were excluded, the Jesuits gathered 100,000 or more converts into some thirty agricultural villages, each with separate family allotments and common "fields of God" for the support of the poor, the aged, etc. Using no money within the settlements and trading outside only by annual expeditions the groups lived a successfully self-contained life in which a rich culture of ritual, pageantry and music grew up, until Spain expelled the Jesuits in 1767 and reduced the natives to virtual slavery.

The thirteenth century Apostolic sect of Alzano in Italy, which later spread to France, the Beghards of northern France and Germany, the Norfolk Lollards, the Weaving Friars of Bruges, the Fraternity of Life in Common in the Netherlands in the fourteenth century, the Taborites of fifteenth century Bohemia, the Moravian Brotherhood and the Anabaptists of the sixteenth century, were mediaeval sects which attempted communistic life. Their membership was lowly in origin, their ideas closely bound up with religious notions of a heretical nature. Their communism was chiefly in the field of consumption,

though in some cases production seems also to have been regarded as a fit category for communistic organization and control. It was, however, in the nineteenth century that self-conscious communistic settlements were attempted in great numbers by both religious and non-religious groups. They centered chiefly in the United States.

Such experiments were of two main types, which occasionally are to be found combined. On the one hand, small Christian sects, especially in Lutheran Germany, making literal interpretations of the Sermon on the Mount, underwent persecutions in their homeland which induced them to remove to the United States. In some such cases there seems to have been no interest in communism *per se*. Where desire to preserve genuine equality between man and man did not lead them to communism, they turned to it as that form of social organization best fitted to their needs. No difficulty was experienced in finding justification for communism in the words of the New Testament. The second type, non-Christian and often antireligious, was connected through the tradition of utopianism with older movements in favor of communism as a universal social order. Its leaders were rationalist social reformers believing in the perfectibility of man. Christian and non-religious communistic settlements had a common social origin in the revolt of discontented groups from the pressures and dislocations of the evolving capitalist order, and had in the remote background common ideological roots in the ancient doctrine of natural law and the Manichaean view of the viciousness of private property. One communistic experiment cross fertilized another and there must have existed large numbers of short lived communities, most of which have left few traces. However, a number of such settlements still exist.

The Shakers (United Society of Believers), a celibate body of men and women, began community living at Mount Lebanon, New York, in 1787, their doctrines having been consolidated by Ann Lee, their English leader, some time before her departure for America. Their population reached a maximum of 5000, but now the eighteen settlements have been reduced to a handful and the membership is less than 200. Their unit was not the settlement but the "family," a group which sometimes included several score "brothers" and "sisters" housed in one building and owning all goods in common. Gardening, fruit preserving and craft work

were the economic mainstays of the communities. The body was governed by a self-perpetuating ministry which appointed elders and deacons, among whom were women. There were grades of membership; entrance and standing were guarded by the confessional. Government was authoritarian, based on religious discipline. Relations between the sexes were carefully supervised: men and women worked in separate shops, ate at separate tables, stood apart at religious meetings, had confessors of their own sex. Their unique religious practises included the "march," their doctrines that of an accomplished millennium and spirit communion.

The Amana Society (Society of True Inspiration), a German separatist sect, settled first near Buffalo in 1843 and later removed to its present site in Iowa. It held that the gift of inspiration resided in its early leaders, Christian Metz and Barbara Heynemann. Its elders were selected by inspiration. Amana elects thirteen managing trustees who appoint superintendents and foremen and assign each member his task. In seven Amana villages there were in 1926 1385 persons operating flourishing farms and industries.

The Hutterian Brethren, a Mennonite body, were Germans who first settled in southern Dakota in 1874. Their church dates back to Jacob Huter in the sixteenth century. They have a most thoroughgoing system of communism; it is said that not even clothing is regarded as individual property. The different settlements, however, operate independently. Their government is in the hands of a *Wirt* (business manager), who appoints assistants and apportions work to individuals, and a preacher, the spiritual head. In 1924 they had twenty-six communities in the United States and Canada.

The Doukhobors are a large Russian sect of religious communists, a portion of whom came from Russia to western Canada in 1897.

The Harmonists (1805-c. 1903), like Amana, came out of the German separatist movement. George Rapp had gathered his millennialist Harmonists about him in Germany and led them in the establishment of communism, including the burning of their property book in 1818, in the adoption of celibacy and through three different removals until their final settlement at Economy, Pennsylvania, in 1824. In spite of hardships and heavy losses the community built up successful industries and became prosperous. Factional disputes occurred, one of which reduced the population of 700 by a

third. The society died a natural death, and when Economy was sold to a land company only a few scattered members remained.

The Zoarites (Separatist Society of Zoar, 1817-98) came to America with the financial assistance of interested English Quakers and set up a colony at Zoar, Ohio. Faced with economic distress among the members, their religion of brotherliness made them declare for community of goods, on which basis the society worked out its articles of agreement and constitution. It had already barred ceremony and form, and practised non-resistance; now it even experimented with community care of children. These experiments and celibacy were abandoned after periods of trial. In spite of withdrawals the society kept a fairly flourishing membership until the younger generation precipitated in 1898 a property division among the remaining members, who numbered over 200.

Eric Janson led his company of Swedish separatists to America with high religious expectations. They were established at Bishop Hill, Illinois, in 1848. Although in 1850 Janson was killed, the community founded industries, cultivated lands, grew and prospered. Some of its members had become alienated early by Janson's unique religious claims and withdrew. After some years factions arose, economic affairs became involved and it was finally decided in 1862 to divide the property and discontinue what remained of community life.

Two communitistic settlements were founded by Dr. Keil, a German by birth, who drew a religious following chiefly from German peasant immigrants. He settled them first at Bethel, Missouri (1844-80), and later led a majority of the body to Aurora, Oregon (1852-81). Keil's autocratic rule was consistent with his religious teaching, which asserted that man should organize community life in imitation of God's parental government, with all things in common and a father as head. He held the community property in his name until 1872, when each member was given a title deed to an equal share. Community of goods continued until the society broke up soon after Keil's death. The population of the two settlements was then (1880-81) nearly 400.

The Perfectionist movement began in Putney, Vermont, in the thirties under John Humphrey Noyes, who preached that perfect freedom from sin could be achieved here and now through personal communion with God and that thereafter communism in personal property and in per-

sonal relations, including marriage, must follow. Objections to their "complex marriage" system caused their expulsion from Putney, and the main body of the group settled at Oneida, New York (1848-81). They lived happily, developing a unique business success in hardware and other manufactures. For morale the community relied upon Noyes' device of "mutual criticism" whereby every member was expected on occasion to offer himself for criticism by a group. Propagation they claimed to conduct on scientific principles. Government and industries were administered by committees and a business board of department heads which held weekly open meetings. Women voted, held office and wore a costume adapted to their new freedom—short hair, long trousers and short skirts. Oneida provided professional and technical training for a number of its young people. Children, as soon as weaned, were cared for in nurseries. In 1879 outside antagonism to "complex marriage" became so sharp that Noyes advised its abandonment. Thereupon most of the members contracted individual marriages and soon communism in property was given up in favor of a joint stock association, Oneida Community Limited, which still exists.

The early history of Mormonism shows tendencies toward collectivism. In the early thirties, while the body still resided in the Middle West, Joseph Smith promulgated and for a time established the United Order plan. It called upon all church members to belong to the order and to "consecrate" their possessions to the church, which in turn would award them a "stewardship" (holding) for which they rendered annual account. During the attempted revival of the order a communitistic community was organized at Orderville, Utah, in 1874 and operated for ten years but was finally disbanded and the property distributed to the members.

Hopedale, Massachusetts (1842-c. 1857), founded by Adin Ballou, a Universalist minister, resembled in organization socialist communities rather than the other religious societies and at one time negotiated with Brook Farm about joining forces. Ballou's aim was to combine individualism with socialism by way of a joint stock concern which should pay wages and permit its members to hold property outside while practising production in common. The society, at one time numbering over a hundred members, survived for nearly fifteen years in spite of financial stress but was finally absorbed into Hopedale parish.

In general the communism of the religious societies was thoroughgoing. Incoming members turned over all property to a common fund. No wages were paid—in Zoar not even to probationers. Every individual was guaranteed the necessities of life and care in sickness and old age.

While distribution was in all cases without respect to person, there was difference in management of details. The Jansonites, Huterites and Amana adopted a central dining hall system, with separate apartments or houses for families, whereas in Zoar, Bethel and Aurora each family lived and ate in a separate home. The celibate Shakers and Rappists conducted all household affairs under one roof, the latter living in very small units, and Oneida had a unitary household similar to socialist plans. Supplies were dealt out according to the number of persons cared for. Clothing was provided from the common stock as the individual had need. Amana members "purchased" from a central store, but it was only a book transaction; and each had to stay within an annual quota, which allowed for some inequality. Only the Shakers, Rappists and Huterites had prescribed costumes, but in all the settlements great simplicity characterized food and clothing. Living quarters, while comfortable, were plain.

There is said to have been no problem of idleness in spite of the many monotonous and difficult tasks. Assignments were changed frequently. Managerial positions and superintendencies and even the most petty posts were filled by appointment. Division of labor between the sexes and vocational training of children followed traditional patterns for the most part. The leaders built up a strong religious sentiment favoring obedience to constituted authority and performance of a fair share of community work. Founders generally joined in manual work and their example became a part of the community tradition. With such exceptions as Noyes and Ballou, they had all been trained to trades and had little formal education. Their followers were likewise recruited chiefly from peasant and manual labor classes and except among the Shakers and Perfectionists and at Hopedale were predominantly immigrants.

Goods were sold on the open market, Oneida and Economy achieving outstanding successes in this respect. The Shakers were noted at one time for their garden seed and Amana for wool products. On the whole, the aim was economic self-sufficiency, and diverse home industries

were fostered. Only machinery, farm implements and similar products were freely bought outside.

Government showed a strong admixture of the theocratic and paternalistic, particularly while the founders lived, but even they were careful to secure community consent on important matters. A compact community life, common religious ideals, agreement on economic principles, uniformity in economic and social practices, expulsion into the outside world as a potential punishment for non-conformists—these were the bases of social order. To conform meant complete acceptance and approval. To deviate meant swift social isolation. The settlements achieved and maintained this compact community life by various means: members signed articles of association agreeing to religious principles and community of property; there was a regular routine built around work, meals and religious exercises; there were frequent meetings, chiefly religious (Amana, Oneida, the Shakers, Jansonites and Huterites had some sort of gathering every day), in which community values and tabus were invoked and community morale built up. The confessional among the Shakers and Rappists and "mutual criticism" for the Perfectionists were effective instruments of social control.

On the whole, attitudes toward family life were traditional except as communism in goods cut across customary household organization. If members married outside the society they had to leave. While most of the young people married, religious distrust of the marital state and praise of celibacy as the higher order are constantly encountered. Even Noyes advocated celibacy as preferable when complex marriage had to be abandoned. It was customary for children to remain in their family homes, but most of their waking hours were spent under school supervision.

While practically all the societies were non-resistant in principle they taught obedience to laws and payment of public taxes. At Zoar and Economy suits were brought by former members and heirs to recover wages and property, but the communities fought these cases and the courts upheld the community contracts. Besides selling their own products on the market Zoar, Bethel and Aurora had general stores where neighbors could buy for cash, and Zoar and Bishop Hill were known for their excellent hotels. Hired labor was a constant source of contact and was employed by all the colonies

when there was need. Oneida and Economy hired large forces for their industries.

Certain settlements tried definitely to propagate their beliefs by written and spoken word and by colonizing: Oneida and Hopedale had an active press, the Jansonites and Shakers sent out missionaries, especially in the early days, the Hutterites and Shakers established colonies.

The leading non-religious communist settlements have been of the Owenite type (clustering about the year 1826) and the Fourierist type (c. 1843).

Arriving with brilliant prestige from his successes at New Lanark, Owen in 1825 bought the entire town of Harmony from the Rappists, rechristening it New Harmony, invited "the well-disposed and industrious of all nations" to join him (withdrawals to be always allowed upon one week's notice) and after a brief period of tutelage, during most of which he was absent, launched the unassorted thousand into full communism. Food, clothing and shelter were to be distributed according to need, and all labor was to be accounted equal. (The preliminary constitution had provided for individual store credits and for work credits according to output.) No provision was made for individual incentives, still less for organized criticism; praise and blame were alike contrary to Owen's philosophy. Nor was the work adequately planned in advance. Owen hired outside labor in quantities where necessary, but some of the basic industries remained undermanned and some overmanned. After two years of steady financial loss, but of interesting social and educational life and any amount of stimulating give and take with the outside world—years during which ten daughter communities had been allowed to split off and settle upon outlying portions of the estate—Owen in 1828 was forced to declare the experiment closed.

Between 1820 and 1828 at least nine smaller Owenite settlements sprang up and died, chiefly in Indiana, New York and Ohio. The best known of them was Frances Wright's colony at Nashoba, Tennessee, intended for the gradual emancipation of Negro slaves by setting them to work at wages for a white communistic group. In Great Britain Owen's followers established large scale but short lived settlements at Orbiston, Scotland (1826-27), and Queenwood, Hampshire (1839-45). Both attempted communal living and equal rewards. The Orbiston community, however, was a purely philanthropic venture with an unselected,

poverty stricken population left to evolve its own government out of a condition of benevolently intended anarchism, while the Queenwood group was made up of delegates from town working men's cooperatives, unused to rural labor and involved in absurd expenditures by Owen and other leaders, yet holding hard to their attempt.

The Fourierist settlements in America took their rise from the preaching of Albert Brisbane and Horace Greeley. Propaganda groups rapidly formed in New York, Albany, Rochester and other cities. Within a decade at least thirty-three "phalanxes" were founded throughout the Middle West and Middle Atlantic regions. The longest lived were the Wisconsin Phalanx (1844-50) and the North American (near Red Bank, New Jersey, 1843-56), each numbering something over one hundred members. Both were substantially self-supporting and appear finally to have dissolved chiefly from a lack of internal conviction and a desire for greater profits on the part of their stockholders. Dissolution was precipitated in the North American by an expensive fire, in the Wisconsin Phalanx (where stock paid 12 percent the first year and 8 percent at dissolution) by a series of disagreements over the question of unitary versus separate dwellings. Meanwhile in 1855 some of the members of the North American had gone to join a short lived but costly colony founded, largely with French money, by Fourier's leading disciple, Victor Considérant, in San Antonio, Texas.

Fourier's principle had been attractive labor and combined living but individualized reward—not really communism but joint-stockism, capital receiving interest and each man his own wage, including a differential for talent or for disagreeableness of task. The *phalanstère*, always in his conception a large unitary building, was to provide different grades of accommodation for different purses. In America these distinctions were not generally maintained, but the principles of joint stock, unitary building, wage labor and freedom of occupation were usually followed. Both the Wisconsin and the North American phalanxes allowed one fourth of net profits to capital and three fourths to labor, and both attempted to grade work and rewards into three classes: "necessary," "useful" and "agreeable." The North American rented rooms at different prices and in its later years served meals à la carte. Both hired outside labor and allowed members to invest outside and to work

outside when opportunities in their own line were lacking within the colony.

Brook Farm (1841-46) went through a Fourierist phase. Essentially it was a group of intellectuals seeking the simple life and touched with the same transcendentalism as that of Bronson Alcott in his Fruitlands of 1843, a group whose members had at first no social dogma. They assigned a flat 5 percent interest on investment, paid equal wages to all and guaranteed to all support during disability. In 1844 the farm became a phalanx. It never paid for itself and dissolved in 1846 after the destruction of its new unitary building by fire. In France abortive attempts at phalanxes were made at Condé-sur-Vesgres in 1833 and at Cîteaux in 1841. Godin's famous profit sharing establishment at Guise, the *Familistère* (incorporated in 1880), had Fourieristic features.

The longest lived of the nineteenth century non-religious communities, Icaria, was neither Owenistic nor Fourieristic. It was founded by Cabet in 1848 and survived various removals and vicissitudes until 1898. Its membership was homogeneously French, chiefly of the town artisan class. The Icarians were sturdy, thrifty and devoted to a cult of humanity. Landing in Texas with insufficient funds and false hopes upon an enormous tract of unsuitable land, they were promptly forced, almost bankrupt, to remove to Nauvoo, Illinois (1849-60), newly vacated by the Mormons. Here they painfully worked themselves out of debt, aided in part by the parent Icarian bureau in Paris. Factional strife, centering first in Cabet's dictatorial leadership and after his death in divergencies of policy between the older and younger generations, resulted in repeated splits with further removals, loss of membership and continuing impoverishment. The communities, however, remained self-supporting: Cheltenham, Missouri (1858-64), Corning, Iowa (1860-78), two groups in other parts of Corning (1878-87 and 1878-98) and a little group in Icaria Speranza, California (1883-86), who became rich ranchers and after five years gave up their communistic constitution. Throughout their career the Icarians maintained a combination of individual dwellings, strict family life (marriage being held obligatory and binding) and absolute communism of goods. Very little outside labor was used, but at Corning the members successfully maintained small workshops in the village. Education was cherished, good public schools maintained and American citizenship sought.

Close connections with the mother country were kept up, however, at first through the Icarian bureau in Paris and always by fresh accessions to membership. Much propaganda literature was printed in French and German. French was always spoken in the home.

By way of reaction to the Owenite communities a series of anarchistic "villages" were founded by Josiah Warren: Equity, Ohio (1830-32), Utopia, Ohio (1847-c. 51), Modern Times, Long Island (1851-c. 60). Returning disappointed from New Harmony, Warren had determined to found groups of his own in which "the sovereignty of the individual" should be demonstrated, each man's activities being carried on exclusively at his own cost. Outside capital was to be dispensed with. In each of his villages Warren actually succeeded in having labor exchanged for labor and in building up, temporarily at least, homes and small industries without partnerships or merging of individual interests.

In recent times in addition to ephemeral colonies in France, England and Brazil, such as Vaux and Aiglemont (1903-05), Clousden Hill (1891-98), Cecilia, Brazil (1890-?), there have been several small anarchist settlements in America with communism as the basis of organization. One, Ferrer Colony, at Stelton, New Jersey, founded in 1915 and centering in a school, is still in existence.

A semi-anarchistic settlement was Ruskin Commonwealth (1894-1901), situated first in Tennessee and then in Georgia. Founded by the editor of the *Appeal to Reason*, its membership, numbering at one time over 250, comprised both socialists and anarchists, and successive constitutions showed the influence of both. In the community's last phase work credits were the same for all, but government was exercised on ordinary political lines.

A present day group combining communism with producers' cooperation is that of New Llano, founded in 1914 in California and removed in 1917 to Louisiana. Financed by shares and providing individual housing the community conducts all its work in common and pools most of its consumption goods.

What was essentially a land reform colony with collectivist features was started on an enormous scale by one A. K. Owen, an American civil engineer, at Topolobampo, Mexico, in 1886. Lands and house lots were to be held by lease only, while improvements remained private property. Industries were to be owned

collectively. Services were to be paid for in scrip. In spite of the unsuitable human material available an entire city was laid out and much construction work was done by the colonists. The Mexican government withdrew its concession in 1895 and the whole project lapsed.

A successful single tax colony is that of Fairhope, Alabama, founded in 1895. Here living is individualistic and improvements privately owned, but land is held by the corporation and leased on ninety-nine-year leases annually revised, the corporation paying out of these receipts all taxes on personal property and improvements. Various public utilities are also collectively owned.

In Palestine today some of the newer Jewish settlements have been organized into *kvutsoth*, or agricultural collectives, practising not only production but consumption in common. Dwellings are congregated, meals are eaten together, children are cared for in day nurseries, clothing and implements are often provided by ticket. Dealings with the outside world consist chiefly of communal book credits on the roll of the Hamashbir, the consumers' cooperative society of Palestine. None of these colonies is economically self-supporting, deficits being made up by the World Zionist Organization.

On the whole, the non-religious groups, with the exception of Icaria, have been more ephemeral than the religious. Among the former, taking Icaria, the phalanxes and the Owenite communities as the most important examples, the most general economic weakness was a lack of balance; almost all were overstocked with land, and understocked with industries. In the case of New Harmony, plants were available, but were allowed to produce without proper regard to demand. Most of the sectarian settlements began life with a better balance of craft and agricultural elements. The poverty accompanying the initial period of economic trial and error was met by them with religious perseverance and closer communal unity. Thus they endured long enough to become established, to feed themselves and at the same time to produce goods for exchange at prices that could compete in the market. For a time, the Icarian handicraftsmen, and to some extent the millers and market gardeners of the North American Phalanx, were equally successful. The religious groups and the Icarians which rigidly ruled out any private remuneration lasted longer than those communities which relied on wage payments as an incentive.

Where the machinery of government was most democratic, policies were constantly in dispute and no leadership proved permanently acceptable. Among the more authoritarian groups, on the other hand, the tenure of office of leaders was often long, and power, once granted, was rarely questioned. While their system involved suppression of individual "rights," whatever of conflict existed between individual and group was much less than the constant friction in the non-religious societies which attempted to reconcile notions of extreme individualism with communitistic life.

All communities sought by frequent meetings to maintain group morale. Even the non-religious usually had some degree of ritual observance—readings from the works of Cabet, Fourier, Owen; music, poems of communism and so on; at the same time they reached out for support to the like-minded of other settlements—propaganda literature was widely read and printed, pilgrims from distant and apparently divergent groups were warmly welcomed.

The fact that the non-religious groups ranked high culturally seems not to have been a bulwark against failure. Most of them welcomed all forms of education and sacrificed to achieve them for their children. The New Harmony schools were famous. Most also favored greater liberties for women, and some of the phalanxes attempted to pay them nearly on an equality with men.

The actual cessation of community life resulted from a complex of causes. Disasters like the death of a founder or a fire that swept away valuable property or the mishandling of finances were in some instances followed by dissolution. There were, moreover, always present elements of dissatisfaction. All the communities wrestled with the problem of their human material, even where a long probationary period and a religious test sifted out those least in harmony with the settled aims of the society; and it proved a major difficulty for those who welcomed any and all disposed to join. Nor did two or three generations of existence guarantee continued life, for the willing adherence to community ideals of the old was not easily passed on in its full strength to the young. Surrounding them there was always the competitive social order with the pressure of its size and accepted practices. Communal living sometimes inspired individuals to inventions, to new labor techniques and the like, and many groups made good use of the advantages incident to centralized planning and pro-

duction. Yet these little communities had of necessity to participate in methods of taxation, of exchange, of investment, and, where outside labor was hired, of remuneration, which were current in that larger society and which were in many particulars diametrically opposed to their own. It is not surprising, therefore, that it took a unique combination of factors to permit any one of them to exist for long, and that communistic settlements have remained separatist in nature and circumscribed in influence.

COMMUNITY. Historically considered the interpretation of the term community has evolved from a simple to a complex conception. As originally used in the literature of the social sciences community designated a geographical area with definite legal boundaries, occupied by residents engaged in interrelated economic activities and constituting a politically self-governing unit. Thus hamlets, villages, boroughs, towns and cities were considered to be communities; and such communities, in turn, were thought of as being parts or fragments of larger societal units such as counties, states, nations. It will be seen that this conception of community was derived primarily from ideas of structure: a geographical area, a system of interrelated economic institutions and an independent framework of government. The newer conception of community, on the other hand, is derived principally from ideas of process. This conceptual evolution came as a consequence of general social change by which communities were significantly influenced and as a result of the introduction of newer disciplines, especially those derived from psychology, into the thought of social scientists.

Certain social trends operative for some time may be said to have become specific in direction during the last half of the nineteenth century. The factory system became corporate and projected itself beyond community boundaries.

manufacturing establishments were located in definite geographical areas but were owned by many stockholders living in other communities. Commodities were no longer produced for local consumption. Craftsmanship on the part of workers became less and less essential as machines and mass production methods increased; consequently laborers became more mobile: they moved more readily from one community to another. At the same time means of communication—railways, street cars, highways, automobiles, telephone, telegraph, etc.—improved rapidly, tending to make the local community more flexible and less self-contained. Just as observers were beginning to recognize the emergence of a new type of local community, due to those and other economic, technological and social changes, social scientists were at work revising their concepts. They began to interpret social processes in terms of human nature; the dynamics of society were seen to reside not in its structure but rather in the interests, wishes, desires and purposes of individual human beings interacting with other human beings in varieties of social groupings. The local community therefore came to be viewed as one of the types of social grouping in which human nature and its impulses were expressed, while the origin of these impulses and the principal conditioning factors in their expression were thought to be psychological.

As a consequence of the two trends mentioned above, new meanings and shades of interpretation were added to the concept of community. If, for example, community is to be regarded as a process term describing how human beings interact, why is it not synonymous with the concept of society? Some theorists, accepting this point of view, have come to use the term community in this societal sense. Others, influenced by the rise of social psychology, wish to reserve the term for the more positive aspects of social interaction; they designate all forms of association in which wasteful conflict has been eliminated and in which the associational processes appear to produce plus values, in so far as human nature is concerned, as communities. Political scientists still view the community, both as structure and as process, in terms of the ways in which governmental forces arise from social interactions. Social workers continue to regard the community from two points of view: as a configuration of families and as a system of institutions designed to exercise social control and assume social responsibilities.

A sound definition of any term will of course include both structural and functional elements. A combination of the two following definitions might make the concept entirely clear. A community, if we define its explicit elements, is any consciously organized aggregation of individuals residing in a specified area or locality, endowed with limited political autonomy, supporting such primary institutions as schools and churches and among whom certain degrees of interdependency are recognized. This definition will include hamlets, villages, towns and cities. A community, if we define its implicit elements, is any process of social interaction which gives rise to a more intensive or more extensive attitude and practise of interdependence, cooperation, collaboration and unification. This latter conception omits all consideration of locality or other spatial terms and directs attention to the processes by which socialization takes place, processes which are in essence psychological. In a logical sense these two definitions cannot be conjoined, since one points toward structure and the other toward function; we may, however, think of these two attributes of reality together, that is, as structure-function. Perhaps most ordinary thinking about communities includes both concepts, and for this reason the logical difficulty is not important.

The margins or boundaries of a local community can never be precisely designated since more than one center invariably exists. Some sociologists have attempted to utilize the category of economic interest as the significant center: calculating from the premise that all persons who produce, sell and buy goods within a given area are by that token members of a given community they have endeavored to draw the boundary lines in such manner as to include all such persons. Others have essayed the task of describing the local community in terms of other interests, such as religion, education and recreation. Still other investigations have proceeded upon the theory that membership in a community derives from a conscious sense of "belonging"; if, for example, people state that they belong to this or that community, it should be taken for granted that they may then be included within this or that community's boundaries.

None of the above attempts to describe the local community in accurate spatial terms is likely to prove satisfactory; the fact that experience and interests flow from more than one center, that our economic and social processes become increasingly flexible and that improved

modes of communication tend to multiply and expand the possibilities of interaction combine to make community boundaries fluid and indefinite. But in spite of these difficulties the local community as the nexus of functional interaction remains an important category for the social sciences.

Within the local community and functioning primarily in relation to the community as a whole one discovers the most significant forms of human association. First among these is the family, the propagating unit of society; marriage, family rearing and home making represent processes which may fairly be said to condition the total quality of social experience. Then there is the neighborhood, which may be considered as a cluster of families together with a few institutions; within the neighborhood unit children secure their first generalized social expression and adults carry on most of their sociable activities. In metropolitan communities neighborhoods tend to disintegrate, but most communities may still be described as patterns of interrelated neighborhoods, each representing a different quality of social life and each consisting of interrelated families. And as an antisocial index it is worth noting that so-called "gangs," or criminal groups, evolve on a neighborhood basis. The established institutions of a given society also function community-wise; thus churches, schools and secret societies exist as local units; those primary adjustments which all persons make to the institutional controls of society are therefore a part of that sphere of experience which belongs to the community. And, finally, in all modern communities one discovers the rise of new social forms which may be called functional groups. These so-called functional organizations are voluntary associations; each is based upon some distinct human interest or group of interests. Thus there are chambers of commerce and manufacturers' associations organized to enhance the interests of their members; likewise there are trade unions designed to advance the interests of the workers; these two are simple forms of functional groups, but numerous other types exist and new ones are continually arising. The real community process, that is, that sphere of interactions which results in effective social control, may be said to reside in these functional groups; they are already more powerful in essence than combinations of families, neighborhoods and institutions.

The status of an individual in a modern community derives from his relationship to func-

tional groups. His personality and his interests are effective in so far as represented in organized forms; the unassociated individual loses both status and functional capacity. Indeed, it may be said that a modern urban community progressively becomes a web of organized interests; the community process, in turn, comes to be that complex of interactions which proceeds from organized interests. It is to be noted that in rural areas, villages and smaller cities the community process is still more closely related to family, neighborhood and institutional factors. From the point of view of social control, or of "social engineering," it becomes increasingly obvious that attention needs to be directed toward those skills, techniques, procedures and methods according to which these functional groups arrive at decisions, prosecute their respective projects and interact with each other. It is at this point that the two concepts of community, the structural and the functional, converge: the community is an aggregation of individual human beings living within numerous types of groupings; the level of community experience depends upon the quality of social interaction which characterizes each of these groupings, and their consequent interrelationships.

It should be noted at this point that these various functional groups which now exercise so much influence upon local community affairs all tend toward extracommunity expansion. They furnish opportunities for primary social experience within the community setting, but they also tend to project this experience outward. This fact does not diminish the significance of these groupings—the manner in which they give the meaningful clues concerning specific communities—but it does indicate that even here the local community tends toward dispersal and not toward intensification.

Some of the trends which appear to characterize contemporary community development need to be noted, since communities and their processes are in perpetual flux; comprehension of the concept of community depends upon insights concerning the ways in which communities change and evolve. These changes may be most briefly expressed in a series of categorical statements. Modern communities, especially urban, tend toward occupational rather than neighborhood development; each section of the community is coming to be used for a special economic purpose. The distances between residence, place of work and place of recreational

and sociable activity tend to increase as means of transportation are improved. Functional groups are coming to represent all vital interests and their variety, number and influence are increasing steadily. Secondary means of communication are reducing social relationships to more impersonal levels. Community populations tend toward greater mobility. Finally, experience within a community, due to separation of residence from work and to multiple functional organizations, tends to become fractional; that is, the total personality is less known to any group and has less opportunity for expression. These trends are of course characteristic of cultural evolution in the whole of so-called western civilization. Communities are in one sense initiators of cultural change and in another sense they become merely the reflections of deep seated, changing forces in cultural systems. The degree to which changing communities may be regulated and guided with respect to desirable goals remains the problem of the social sciences.

COMMUNITY CENTERS. The community center may be defined as a meeting place where people living near by come together to participate in social, recreational and cultural activities and build up a democratic organization that will minister to the needs of the community. The social philosophy out of which it grew has been concerned with the promotion of community solidarity and the development of a sound community life.

The term community center began to come into general use about 1915 as a new name for the social center, which had attained considerable popularity during the decade prior to the World War. The modern emphasis upon social centers arose in connection with the work of social settlements and institutional churches. But there was no widespread interest in the movement until the opening of the present century, when school buildings in New York and a few other cities began to be utilized by people living in their vicinity for adult education classes and recreational programs. Impetus was given to these experiments by the establishment in Rochester, New York, in 1907 of school social centers with an elaborate program of community activities, which included discussion of civic problems, the organization of clubs of different kinds and provision for recreational features. Similar centers were organized in other cities, and in 1911 the movement had gained sufficient support to make possible a national conference on social centers and the completion of a national organization known as the Social Center Association of America.

During the next few years the term community began to gain wider currency, and as a result of the growing interest in the community as a social unit the National Community Center Association was organized in 1916 by those most actively concerned with the promotion of school centers. Under the influence of the rapidly expanding community movement social centers were renamed community centers, although this did not involve any essential modifications of their activities. This community use of the school plant was given great popularity during the World War through the efforts of the Council of National Defense to make the school the headquarters for the promotion of war work. A popular slogan at that time was, "Every school house a community capital and every community a little democracy." Thousands of local community councils of national defense were established and these for the most part carried on their activities in school buildings.

Since the war schoolhouses have in general been readily available for community activities, but only in a small minority of schools are community center programs operating as a regular feature of community life. The most recent survey of school community centers in 1924 revealed that there were 1569 centers open as often as once a week for two or more activities other than night school, or open for one activity other

than night school as often as twice a week. These were located in 722 cities, townships and villages, 240 of which were cities of more than 5000 population. Infrequency of operation of the school community centers is one of the striking facts brought out in this survey. Only 25 percent were open during nine months of the year and 44 percent operated only one or two nights a week.

Nevertheless, the community center has had a popular appeal, due largely to its emphasis upon recreational activities. It has provided facilities for games, athletic contests, gymnastic training, dancing and social gatherings of various kinds. At the same time it has carried on adult education work, while Americanization classes have been conducted for the foreign born and vocational instruction has been offered in centers equipped for work of this kind.

The financial support of school community centers has come largely from public funds. In cases where official appropriations are not available or are inadequate a local association may assume financial responsibility. No uniform plan of administration and control has been adopted. In 1924, 61 percent of the school centers were administered by school boards, 12 percent by recreation commissions and park boards, 16 percent by school boards in cooperation with private organizations and 11 percent by private organizations. The marked trend toward official control is deplored by those who look upon the community center as a training ground for democracy.

While the movement was developed largely in connection with the effort to make the school the headquarters for community activities, it is now generally recognized that the school is only one of the possible centers of community life. Community churches, community houses, playgrounds and other institutions and facilities with a wide local appeal have in many cases either supplanted the school centers or decreased the demand for their establishment. Moreover, the former emphasis upon the community center as a common meeting ground for the discussion and solution of local civic problems has been forced into the background by the rapidly growing demand for better recreational facilities. The earlier types of community center programs find it increasingly difficult to compete with the elaborate provisions for recreation developed under the auspices of municipalities, private groups and commercial interests. Furthermore, the vast improvement in transportation has greatly increased mobility, and as a

consequence people are less inclined to unite in support of local centers because of community loyalty.

Nevertheless, community centers are still playing an important role in American life. The architecture of schools and churches has been changed to meet the requirements of the community center movement. A majority of the states have in force laws authorizing the community use of school buildings. Specially designed community houses have been built in many small communities. The present trend seems to be away from the single, inclusive type of center, as it was first developed, and toward the operation of a variety of centers under different auspices and offering specialized programs mainly of a recreational nature. Just as social centers were supplanted by community centers, the latter are now giving way to recreational centers and apparently are being merged into the wider recreational movement.

New York 1930); *The Social Center*, ed. by E. J. Ward (New York 1913).

COMMUNITY ORGANIZATION is a term that has recently come into common use to designate the various activities and programs of social reconstruction that are built around the community as a social and ecological unit. Interest in the community as a means of approach to social problems received its first great impetus from the work of the social settlements, and it was largely through their influence that various types of community programs were developed which constitute what is now known as the community movement.

The problem of organizing the community, which was at first neglected, has recently been approached from two different points of view. The first, the direct approach, seeks to organize the community by reconstructing the neighborhood through activities and programs in which all the people are to participate. An instance of this type is the school community center, in which the school becomes the headquarters for

a local association comprising different groups interested in recreation, adult education or other civic affairs. While the program of such a center does not include all the interests of the people, its justification as a community organization is found in its efforts to enlist the support of all the people of the immediate neighborhood in behalf of its activities. Leaders in the playground movement have also helped to build up this type of community organization through their attempts to secure community wide support of a recreational program and thus develop the co-operative spirit essential for community action. In rural sociology also there has been an attempt to revive in the somewhat sterile life of the American village today something of the community of interest which is still found in foreign rural life. The distinctive characteristic of this first type of community organization is its direct concern with the people themselves rather than with the agencies that are working in their behalf.

The second approach to community organization is through the conscious correlation of social agencies at work within the community in order to avoid the confusion and waste of a multiplicity of specialized organizations. This first took the form of central councils made up of official delegates from the various social agencies and functioning largely through committees that had only advisory powers. Later, financial federations known as community chests were established and have become a widely accepted means of unifying the social service activities of a city. The community chest was at first looked upon as a dangerous innovation that might centralize control in the hands of a few people or enable financial interests to dominate social service policies. Present experience indicates that these fears were unfounded. While the extent to which community chests have influenced the development of professional social work is a moot point, it is clear that because of their financial efficiency they have more securely entrenched private philanthropy. They have not, however, entirely accomplished the needed integration of its various activities.

The limitations inherent in federation have led to the belief that the problem of correlation cannot be solved until the various specialized agencies relinquish their independent existence and amalgamate into a centralized organization, forming bureaus or divisions within it. Social workers generally look unfavorably upon efforts to unite independent agencies and claim that all

the advantages of such a union can be gained through federation. But with the increase of specialized agencies in the field of social work the interests of the community seem to demand a more thoroughgoing merging of their activities and programs than is feasible under any form of federation. An important step in this direction is seen in the establishment in several states of county departments of public welfare which administer all the social welfare activities provided for by law. Amalgamation of this kind means centralized but not necessarily arbitrary control. To a limited extent amalgamation has been tried by the private social agencies through the formation of a social service league in which the agencies of a community are united and become subject to its direction. Another experiment has been attempted in the so-called Iowa Plan, which provides a central organization for the administration of the private charities of the community and the public poor fund. This, however, is limited to only one type of agency and has not yet given promise of wide acceptance.

The attempt of the Cincinnati Social Unit to build up in the community an entirely new organization for the administration of its health and social welfare activities stands out as a significant contribution to the theory of community organization, although it has not yet affected current practice. In the combination of its Citizens' Council based on the block system of representation and its Occupational Council made up of delegates chosen by the various occupational groups this plan of organization gave the public ample control and at the same time utilized the skilled services of community leaders. Since the Social Unit provided a single organization democratically constituted and capable of directing all the social welfare activities of a community, it seemed peculiarly well adapted to deal with the problem of the multiplicity of agencies without incurring the danger of arbitrary control.

Among the recent trends in community organization is the effort to define the community in terms of natural areas that have been built up by the operation of such forces as land values, physical barriers and cultural factors. No less important is the increasing recognition of the difficulties involved in developing programs of social reconstruction around neighborhoods and small communities. The back to the neighborhood philosophy of community organization is becoming impracticable because of the forces

which are disintegrating small communities that were formerly social units of real importance. This fact is leading to a greater emphasis upon the interrelationships between communities as well as the solidarity of any single community. Community organization of the future must adjust itself to changing conditions, which involves the conception of a wider and more flexible unit inseparably interrelated with surrounding areas. The new interest in regional studies indicates a changing point of view that may ultimately bring about a conception of community organization which will be adapted to an era of great mobility and rapid transportation.

COMMUNITY PROPERTY. *See* MARITAL PROPERTY.

COMMUTATION OF SENTENCE. This term denotes, first, a form of pardon (*q. v.*); second and more commonly, a method whereby a person serving a term of imprisonment may, by fulfilling certain conditions specified by statute, earn his unconditional discharge from prison before the expiration of the term fixed by the court. This form of commutation, first used on any scale during the nineteenth century, has reached its greatest development in the United States.

The imprisonment of civil law offenders with the avowed purpose of reforming them is a penal method hardly four centuries old. Its protagonists sooner or later realized that its complete development involved a use of the prisoner's desire for liberty as an incentive to reformation. The problem was to find a means of rendering the fixed penalties of the criminal law sufficiently elastic so that the prisoner's conduct in the institution could be made to some degree a condition for his release.

As early as 1599-1603 prisoners distinguished for good conduct in the Amsterdam Tuchthuys were rewarded by a reduction of their term when the court conducted at the institution its

annual review of sentences. But this practise apparently had no imitators, and not until a century and a half later did prison reformers become more generally conscious of the need for flexible prison sentences. Paley, whose contribution to penology has received no recognition, proposed in his lectures at Cambridge, later published in 1785, that definite time sentences be abolished in favor of those "measured by quantity of work, in order both to excite industry and to render it more voluntary." His suggestion was elaborated in 1829 by Whately, who seems, however, to have been ignorant of its source. The scheme was later modified and developed into practical penal systems by the English prison reformers, Maconochie and Crofton in particular.

In France Mirabeau in 1790 suggested release from imprisonment as a reward for good behavior, and in 1827 Lucas proposed an elaborate plan of grading and promoting prisoners with the same end in view. In 1832 the French ministry of the interior first experimented with conditional release of juvenile delinquents.

Still another plan was proposed by Viscount Vilain XIIII of Flanders in 1775. He favored the exercise of the pardoning power with regulation by law of the conditions under which the prison administrators were to recommend the pardon. This plan found application, it is interesting to note, in the United States in the Tennessee Act of 1836.

The most generally known form of the commutation, or "good time," system was, however, developed in Spain and in the United States. The *Reglamento* for the *presidio* of Cadiz in 1805 provided for commutation for good conduct and the *Reglamento general* of 1807 ordered the reduction of the terms of certain prisoners by two or four months per year. But the experiment was short lived and the code of 1822 adopted a plan similar to that of Vilain XIIII. In the United States the New York statute of 1817 seems to have been the first to introduce a good time law. It provided for a reduction by one fourth of the terms of prisoners sentenced to five years or longer and contained certain other provisions rarely found in later legislation. The law was honored in its breach and was apparently unknown to the sponsors of the more important Ohio law of 1856, which was widely imitated by other states. The Ohio statute contained the essential provisions of a good time law: the keeping of a record of the prisoner's conduct, a list of the requirements for earning time reductions, a specific

scale of such reductions and penalties of forfeiture for misbehavior.

Since the passage of the Ohio act most states and territories of the United States and the federal government have enacted commutation laws. They are by no means uniform: the scale of time reductions and the conditions for earning them vary; under some of them all prisoners may benefit, while under others certain classes are excluded. Misconduct ordinarily may result in the forfeiture of all or part of the time earned, but not so in all states. One feature practically all of these laws have in common: once having earned his good time a prisoner has paid his debt to society and is unconditionally discharged. Here lies the significant difference between good time laws and other devices with similar aims, for usually release under the latter is conditioned on subsequent behavior in liberty as well as on past conduct in the institution.

The greatest benefits of the commutation, or good time, laws have been reaped by the prison administrator, who has frequently found in them an economical substitute for a money wage and a means of maintaining discipline. They have been of little or no value as reformatory agencies, for they have tended to become mechanical in their application and have usually failed to discriminate between the professional criminal and the first offender. Emphasis on obedience to rules has encouraged lip service and external conformity instead of moral or civic regeneration on the part of the prisoner. As soon as more effective incentives were found these laws were doomed to a gradual decline. The introduction of the indeterminate sentence (*q.v.*), in particular, has tended to displace them, although the two systems have not consistently been held by courts or legislatures to be mutually exclusive.

Outside the United States and its possessions good time laws have been applied nowhere except in Canada, which in 1906 adopted a "remission" law, and in the Ukraine, where since 1928 certain convicts are given one day of good time for each two days of labor, a form of commutation not unknown in the United States. Other countries have preferred a system of conditional release, which grew out of the ticket of leave system of the Australian penal colonies.
